The California Healthy Places Index™
## REPORT
http://healthyplacesindex.org

AUTOMOBILE ACCESS: 0.49 Percentile   **Tract: 06075017802**

Introduction

Everyone should have the opportunity to be healthy. One's health is shaped dramatically by community characteristics - like housing, education, economic, and other social factors – which often are themselves shaped through policy. The results shown below can be used to explore, identify and strategize pathways to improve healthy community conditions. The California Healthy Places Index (HPI) combines 25 community characteristics into a single indexed HPI Score correlated to life expectancy at birth. Individual HPI indicators are available for a deeper look at community conditions impacting health. The scores are displayed in quartiles, allowing for straightforward comparisons within a specific geography and across the state.

Above Poverty

Percentage of the population with an income exceeding 200% of federal poverty level. This indicator is from the California Department of Public Health's Climate Change and Health Vulnerability Indicators Project.

Value	Percentile	Data Year
64.1	46.22	2011-2015

Less   More
How does this connect to health?

Every household should be able to afford the necessities of a healthy life—medical care, healthy food, quality housing, education, and other basics. Research indicates that economic opportunity is one the most powerful predictors of good health, and that impacts on health are especially pronounced for people in or near poverty.

Where to start addressing this indicator?

Economic Opportunity: Raise Wages and Benefits; Build Wealth; Build Workforce Development and Pathways; Develop Community Economic Capacity

Transportation: Improve Transportation Access to Economic Opportunity

Economic Policy Area

Economic score, summed Z-scores of individual policy action area variables

Crime
Number of Violent Crimes per 1,000 Population. This indicator is from the California Department of Public Health's Climate Change and Health Vulnerability Indicators Project.

Value	Percentile	Data Year
8.47	NA	2013

Extreme Heat Days

Projected number of extreme heat days in a year under the RCP 8.5 scenario, defined as a day in April through October when the Maximum Temperature exceeds the location's Extreme Heat Threshold, which is calculated as the 98th percentile of historical maximum temperatures between April 1 and October 31 based on observed daily temperature data from 1961−1990. This indicator is from the California Department of Public Health's Climate Change and Health Vulnerability Indicators Project.

Value	Percentile	Data Year
13.7	NA	2080-2099

How does this connect to health?
Our homes, neighborhoods and workplaces should help protect us from heat-related health impacts. Extreme heat can cause heat-related illness like heat exhaustion and heat stroke, and can exacerbate pre-existing health conditions.

Where to start addressing this indicator?
Preparedness and Response: Getting Ready; Emergency Response

Prevention: Heat Resilient Households; Cool Communities; Green Communities; Smart Growth; Community Power and Connection.

<80% of the Median
Household Income in 2015

How does this connect to health?
Our homes, neighborhoods, and workplaces should help protect us from climate-related health threats like heat waves and flooding. Impervious surfaces are materials that cover the ground and do not allow water to soak into soil. These surfaces can intensify heat events by capturing heat and can also exacerbate flooding and reduce groundwater reserves by preventing the absorption of water into the soil.
