

As a leader in providing sustainable transportation options, the SFMTA is well positioned to meet the City's ambitious climate action goals. It is critical that San Francisco continues to invest in transit, walking and biking to ensure it meets the climate action targets of 80% of trips taken in sustainable modes by 2030 and net zero greenhouse gas (GHG) emissions by 2050.

For more information on the SFMTA's Sustainability and Climate Action Program visit:

1 Clean Fleet

The cleanest transit system of any major city in North America, Muni accounts for less than 2% of the City's transportation-related GHG emissions.

The Original Mode

Pedestrian safety and accessibility projects help to promote walking, which improves public health, supports the local economy AND is 100% GHG emission free!

7 Better Streets

Green infrastructure and design can improve storm water management, increase biodiversity and improve air quality through carbon sequestration and promoting walking and biking.

2 High Occupancy

Muni moves more than 720,000 people every day in a safe, equitable and environmentally sustainable manner.

5 Pedal Powered

Bike projects result in an estimated 82,000 bike trips per day, reducing an estimated 385,400 tons of GHG emissions annually.

8 It's Electric!

A typical car emits about 4.6 tons of emissions annually. Electrification of auto trips has the potential to significantly reduce GHG emissions—improving air quality and public health.

3 Renewable and Electric

Muni's buses run on renewable fuels— GHG-free electricity from Hetch Hetchy and renewable diesel. Muni will be 100% electric by 2035!

6 SFMTA Facilities

SFMTA facility upgrades help to improve Muni service delivery and reduce water and energy consumption—improving overall sustainability of operations.

Sharing is Caring

Shared mobility options, such as bikeshare, carshare and vanpools, can decrease car ownership, GHG emissions, and vehicle miles traveled.
