- Water hammer arrestors shall be provided on the domestic cold and hot water systems in accordance with PDI Standard WH-201. Water hammer arrestors shall be all stainless steel when installed in non-accessible locations. Provide water hammer arrestors at all solenoid valves.
- In the wash bay, provide provisions to safely and easily wash the forehead of the vehicles.

## SECTION 4 - PERFORMANCE REQUIREMENTS

## 4.9.8 Plumbing Equipment

**Domestic Water Heater and Accessories:**

Each building will be provided with a central domestic water heating system located in the Main Mechanical Room. Water heaters will be commercial vertical ASME tank type with 400 series stainless steel or stainless steel alloy tank, 98 percent energy efficiency, low NOx rated, direct vent and sealed combustion chamber, with CPVC combustion intake and stainless steel flue vent piping.

Central domestic water heating systems shall include high/low flow thermostatic mixing valve(s) and a domestic hot water circulation pump(s) to maintain adequate temperature in the hot water circulation system throughout the building. Domestic water heating systems shall heat water to 140 degrees F and thermostatic mixing valve will be provided to temper water supply temperature down to 110 degrees F for distribution. Showers will be limited to 105 degrees F. Hot water circulation will be within a reasonable time frame from the fixture.

Central domestic hot water system shall be provided with in-line domestic hot water circulation pump to provide hot water to the fixtures within 15 seconds.

**Elevator Pumps:**

Each elevator shall be provided with and elevator sump and duplex pump to pump out accumulated water. Pump shall discharge to a minimum size of 6-inch industrial waste sewer pipe.

**Sand and Oil Interceptor:**

All maintenance shop, wash area, etc., floor and trench drains, and elevator sump that have the possibility of receiving oily drainage shall be piped to an exterior sand and oil interceptor

prior to entering the site sanitary sewer system. Oil interceptor shall be sized in accordance with the Plumbing Code. Interceptor shall be precast concrete located in an accessible area for servicing.

**Waste Water Lift Station:**

If the waste water drainage piping systems inside the buildings are unable to connect to the site sanitary sewer piping system elevation, a waste water lift stations shall be provided. Waste water lift stations shall consist of duplex ejector pumps each sized at 100 percent of the peak load in a wet well and a separate valve vault. Duplex pumps shall alternate starts and both have the capability to run simultaneously upon rising level. Pumps shall be controlled by float switches. For ease of maintenance pumps shall be provide with stainless steel rail retrieval system. Waste water lift station shall be connected to the emergency generator. A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.

## 4.10 HVAC

**General:**

The PPC shall design, permit, and construct all HVAC systems. All work shall be in accordance with the City and County of San Francisco, local codes and any criteria listed in this document.

The performance goals depend on the level of insulation added to the building envelope and final glazing choice. The PPC shall be responsible for verifying achievement of goals at each progress design deliverable and at permit. Title 24 requires HVAC design use the 0.4 percent ASHRAE design conditions for the current year. These design conditions may be exceeded for a number of hours per year (due to outside temperatures exceeding

the ASHRAE 0.4 percent design conditions.) While designing to the ASHRAE 0.4 percent conditions by definition indicates that design set points will be exceeded during peak periods, typical design often requires a minimal amount of over sizing so that control is always maintained.

The SFMTA shall assist the Commissioning Provider in the development and implementation of a commissioning plan for LEED compliance.

Seismic-restraint systems shall comply with California Building Code requirements. Refer to structural for wind- and seismic-restraint loading requirements.

Each area within the Bus Yard shall be evaluated for hazardous area classification following NFPA Section 497 and NEC Sections 500-516. HVAC equipment located within each space shall be explosion-proof if relevant for the class designation (Class I, II, or III). Particular areas of concern include those where cleaning or fuel chemicals will be stored or used.

Air handling units may be either indoor or rooftop mounted and shall be located on rooftops or in enclosures with adequate ducting to intake and exhaust to enable effective operation per the manufacturer conditions. Air handlers must incorporate airside economizers as noted in the DCD. The PPC shall propose the area required for air handlers based on ventilation requirements listed in the DCD, and propose locations for air handlers as part of the response.

Exhaust air ducts for air handlers and direct environmental exhaust from maintenance and other spaces shall not terminate within 3' of a property boundary or opening of the building or 10' from a forced air inlet, per CMC Section

## SECTION 4 - PERFORMANCE REQUIREMENTS

502.2.1. Backdraft or motorized dampers are required for all exhaust openings.

Exhaust fans, air handling units, and other mechanical equipment shall be readily accessible for maintenance. Equipment installed above a ceiling must have adequate access through access panels for routine maintenance. Rooftop equipment must be provided with adequate access via a stairwell and at least 5' clearance around the equipment with a walking path. Access shall be limited to only maintenance personnel via secured openings (doors, access panels, etc.). Fans and motors weighing more than 200 pounds shall have full-length hoist rails mounted over the equipment to facilitate service, removal, and replacement.

The Site is located within an area with elevated pollution concentrations designated by the City as an Air Pollutant Exposure Zone (APEZ). As defined in San Francisco Health Code Article 38, this requires residential buildings and other sensitive uses to comply with an enhanced ventilation requirement. All residential units and other sensitive use spaces as defined in Article 38 must be provided with a ventilation system capable of achieving PM2.5 protection equivalent to that associated with MERV 13 filtration, as defined by ASHRAE Standard 52.2.

- RFP phase: Proposers shall indicate in their proposed design how they will achieve compliance with Article 38 requirements and demonstrate how compliance is expected to be met.
- PDA phase: To ensure compliance with the intent of this article, and to limit impact from potential pollution sources generated on-site at the Facility, the design team shall undertake a CFD evaluation of impact to at least one

residential unit per façade. CFD analysis shall indicate the concentration of different particulate matter sizes developed in the unit and determine the equivalent MERV rating based on ASHRAE Standard 52.2. Mitigations shall then be determined to achieve a minimum MERV 13 compliance.

- Based on the results of this analysis during the PDA phase, the PPC shall be responsible for creating a ventilation plan demonstrating compliance with this article, and submitting it to the San Francisco Department of Public Health for review and approval prior to submitting mechanical drawings for approval. Plans must indicate the path of outdoor air and filtration, impact of z-ducts, trickle vents, or other unfiltered air intakes to units, and strategies for common areas of residential units (note that common areas do not require enhanced ventilation if positive pressure is maintained in adjacent units and habitable spaces). The submission shall also include the findings from the CFD analysis.

## 4.10.1 Codes and Standards

The following design conditions apply to all interior building types and uses, unless noted otherwise.

**Load Calculations:**

- Use Radiant Time Series calculation methodology for cooling. Do not use occupancy schedules for cooling system design.
- Do not use internal heating load sources (lights, receptacles, people) when calculating heating system design loads.
- Account for duct leakage in load calculations

- Account for fan heat in load calculations. Model fan static pressure at dirty filter condition.
- Energy modeling programs shall meet all requirements of the USGBC LEED rating program energy modeling requirements. Energy modeling program shall be able to fully simulate all 8,760 hours in a year. The energy modeling program shall be able to separately schedule occupancy, internal loads, lighting, fans, compressors, and other plant equipment. The energy program shall be able to breakout packaged equipment to model supply fan energy separately from packaged energy rates.

## 4.10.2 HVAC Systems for Cooled and Heated Spaces

**Unacceptable Systems:**

- Variable Refrigerant Flow systems are not acceptable because the system is proprietary once a specific manufacturer is selected and installed.
- Systems that utilize electric resistance heating as the primary heating source are prohibited.
- Ground source heat pumps and packaged terminal air-conditioners or heat pumps (PTAC/PTHP) are prohibited.
- Split-systems, except for isolated or remote rooms that require air-conditioning or heating and extending the main air or water distribution service is not cost effective.
- Baseboard, fan coil units or other floor-mounted equipment in occupied spaces. Local vertical fan coil units or heat pumps may be used if they are installed in mechanical closets.

## SECTION 4 - PERFORMANCE REQUIREMENTS

## 4.10.3 System Notes

Systems that use terminal equipment as the primary cooling and air distribution source including, but not limited to fan-coil units, local heat pumps, chilled beams, etc. shall use a Dedicated Outdoor Air System (DOAS) to deliver outdoor air to occupied spaces. DOAS systems shall use exhaust air energy recovery utilizing total energy wheels. DOAS systems may deliver outdoor air to the return side of terminal devices or direct to space. DOAS units shall cool and dehumidify outdoor air to at least a 52 degrees F dew point prior to distribution to terminal devices or spaces. Provide filters upstream of the energy wheel in both airstreams. Outdoor air filters shall be minimum MERV 13. Exhaust air filters shall be minimum MERV 8. Supply fan motors and exhaust fan motors shall be driven with VFDs. Provide airflow stations in both the outdoor airstream and exhaust airstream and adjust fan speeds to maintain design airflow rates as filters load.

HVAC Zones - Up to four offices may be combined on one thermostat controller, provided the offices have identical solar, or the like, heat loading. If a corner office has two different window exposures, then provide a separate zone controller. Each conference room, training room, lounge or other similar room shall have its own zone controller.

## 4.10.4 HVAC Systems for Heated and Ventilated Spaces

**Required Heating System:**

In-floor radiant heating for maintenance bay areas and wash bays. Other storage rooms and shop rooms in the maintenance area may use forced air heat or overhead radiant heat.

**Air Distribution System Design:**

- Louvers:
  - ✓ The mechanical engineer shall select and specify louvers for all air associated with the HVAC system design.
  - ✓ Use wind-driven rain louvers.
  - ✓ Orient louvers so that prevailing winds do not oppose exhaust airflow to the maximum practical extent.
- Duct Design:
  - ✓ All ductwork shall be G90 galvanized steel except in areas where special requirements dictate aluminum or stainless steel duct construction.
  - ✓ Duct construction shall be in accordance with SMACNA HVAC Duct Construction Standards except that minimum duct thickness allowed shall be 24-gauge galvanized steel in all locations.
  - ✓ All duct systems shall be sealed to SMACNA Seal Class A.
  - ✓ Specify ducts to be constructed to the next higher pressure class than the maximum anticipated operating pressure.
  - ✓ Duct systems operating at a pressure class greater than 2-inches (positive and negative) shall be constructed of round or oval spiral seam ducts.
  - ✓ Duct elbows that have an air velocity exceeding 2,000 fpm shall have a radius/width ratio of 1.5. Duct elbows that have an air velocity less than 2,000 fpm shall have a radius/width ratio not less than 1.0. All mitered elbows with a turning angle greater than 30 degrees shall use single wall turning vanes. All tees shall include turning vanes. Branch duct taps shall be use low-loss fittings.
- ✓ Acoustical duct liner shall be flexible elastomeric designed specifically for sound attenuation. Glass fiber or mineral fiber duct liner is not acceptable. Acoustical duct liner in ducts with an air velocity exceeding 2,000 fpm shall utilize double wall duct with a galvanized steel perforated duct liner. Acoustical duct liner in ducts with an air velocity less than 2,000 fpm may use single wall duct.
- ✓ Duct insulation shall be flexible wrap with factory applied FSK jacket. Ducts located in high-abuse areas such as mechanical rooms shall be rigid board insulation with factory-applied ASJ.
- ✓ All dampers that process outdoor air shall use 316 stainless steel dampers. Control actuators shall be mounted outside the airstream.
- ✓ Outdoor air dampers, exhaust air dampers, and control dampers shall meet AMCA Publication 511 Class 1 leakage requirements.
- ✓ Dampers at air-handling units mixing plenums and two-position dampers shall be parallel blade. All other control dampers and balancing dampers shall be opposed-blade.
- ✓ Fire dampers shall be "blades out of airstream" type.
- ✓ Balancing dampers shall be located in duct branch as far from the supply air terminal as possible.
- VAV Terminal Units:
  - ✓ Acceptable types are single duct shut-off and parallel fan-powered. Preference is for single duct shut-off due to additional

## SECTION 4 - PERFORMANCE REQUIREMENTS

maintenance and noise concerns with fan-powered units. Fan-powered units if used shall only use electronically commutated fan motors. VAV units shall be pressure independent.

- ✓ Select VAV units that can throttle to 20 percent of design airflow to reduce unnecessary reheat.
- ✓ VAV units shall be double wall construction.
- Air Terminals:
  - ✓ All diffusers, registers, and grilles shall be aluminum construction.
  - ✓ Select air terminals with a high air diffusion performance index (ADPI) for the specific room.

**Water Distribution System Design:**

- Chilled Water Piping
  - ✓ Up to and including 2-inches – ASTM B88 Type L copper (use ASTM B88 Type K copper below grade)
  - ✓ 2-1/2-inches and larger – ASTM A53 Schedule 40 steel.
  - ✓ Pipe insulation – fiberglass, thickness as required by ASHRAE 90.1. Provide ASJ with vapor retarder on all chilled water piping. Chilled water piping greater than 1-1/4-inches located in unconditioned spaces and in all mechanical rooms shall use minimum 2-inch thick phenolic or 3-inch thick cellular glass. Chilled water piping 1-1/4-inches and smaller shall use 1-1/2-inch thick flexible elastomeric.
  - ✓ Pipe jacket – provide ASJ with vapor barrier in all locations. Provide PVC jacket in mechanical rooms and other areas subject to damage. Provide stainless steel jacket outdoors above grade.

- Chilled Water Condensate Piping
  - ✓ Up to and including 2-inches – ASTM B88 Type L copper (use ASTM B88 Type K copper below grade)
  - ✓ 2-1/2-inches and larger – ASTM A53 Schedule 40 steel.
  - ✓ Pipe insulation – fiberglass with ASJ and vapor barrier or flexible elastomeric. Thickness as required to prevent surface condensation. Provide cleanouts on high ends of condensate piping.
- Heating Water Piping
  - ✓ Up to and including 2-inches – ASTM B88 Type L copper (use ASTM B88 Type K copper below grade)
  - ✓ 2-1/2-inches and larger – ASTM A53 Schedule 40 steel.
  - ✓ Pipe insulation – fiberglass, thickness as required by ASHRAE 90.1. Provide ASJ with on all heating water piping.
  - ✓ Pipe jacket – provide ASJ in all locations. Provide PVC jacket in mechanical rooms and other areas subject to damage. Provide stainless steel jacket outdoors above grade.
- Radiant Floor Heating Piping
  - ✓ Cross-linked high density polyethylene (PEX) manufactured in accordance with ASTM F876 and ASTM F877. Radiant floor tubing shall carry a minimum 30-year warranty.
- Pipe Hangers
  - ✓ Provide clevis type hangers with insulation shield, minimum 12-inches long centered in hanger. Strut systems may also be provided with protective insulation shield.

- ✓ Use pipe rollers, guides, and expansion loops as necessary to accommodate thermal expansion.
- Flow meters, Separators, and Expansion Tanks
  - ✓ Provide in-line electromagnetic type. Provide isolation valves on both sides of meter with minimum straight pipe distance recommended by flow meter manufacturer.
  - ✓ Provide air and dirt separator in chilled water and heating water systems at plant. Provide dirt separator in condenser water system. Provide isolation valves on both sides of separator.
  - ✓ Expansion tanks shall be welded steel closed bladder type, tested and stamped in accordance with ASME SEC VIII, rated for working pressure of 125 PSIG, with replaceable flexible heavy-duty bladder.

**Refrigerant Distribution System Design:**

- Refrigerant Piping shall be ACR copper.
- Pipe insulation – Flexible elastomeric, thickness as required by ASHRAE 90.1. Insulation both suction and gas piping separately.
- Pipe jacket – Provide PVC jacket in mechanical rooms and other areas subject to damage. Provide stainless steel jacket outdoors above grade.
- Use only brazed joints.

## 4.11 Equipment

**General:**

- All motors powered by variable frequency drives shall include a motor shaft grounding ring. All motors shall be premium efficient. Use direct drive motors where available

**SECTION 4 - PERFORMANCE REQUIREMENTS**

- Use electronically commutated motors in small, low power applications where available. Provide minimum 6-inch tall concrete housekeeping pads for major equipment
- Fouling factor for heating water heat-transfer coils shall be at least 0.00025 hr-ft, 2 degrees F/Btu.
- Provide buffer tanks if system water volume is below recommended minimum system values as directed by manufacturers.

**4.11.1 Air-Cooled Chillers**

Provide a factory assembled and tested, positive displacement packaged chiller. Design for primary variable flow to avoid unnecessary constant volume pump energy. Select chillers that maximize IPLV. Select chillers that have minimum turndown of 25 percent or lower. Provide chiller with the following features: Factory installed evaporator flow switch. Provide condenser coil with factory applied coating to protect against salt water corrosion. Air cooled chillers to be provided with these features.

- Microchannel condenser coil
- Low ambient controls to 0 degrees F
- Single point of power and integral disconnect switch
- Factory-insulated evaporator
- Hail guards
- Chiller heater
- Controls transformer

**4.11.2 Central-Station Air-Handling Units**

Central-station air-handling units shall be 18-gauge galvanized steel double wall casing. Casing insulation shall be a minimum R-12 rigid insulation. Insulation shall not be exposed to airstream. The casing air leakage rate shall be no more than 1 percent at 8-inches of water gauge pressure.

Hinged access doors shall be provided in every section requiring routine access for maintenance including, mixing plenums with damper actuators, filter section, access sections for coil cleaning, and fan sections. Provide LED lights in all access sections. Access doors shall be thermally broken and gasket around door perimeter.

Provide base rail and concrete pad combination necessary to support correctly sized condensate drain trap. Minimum base rail height shall be 6-inches.

Provide 4-inch thick MERV 8 pre-filters and MERV 13 pleated final filter. Each filter bank shall have a separate differential pressure gauge and separate analog inputs to BAS.

Provide window and lights in fan sections.

Hydronic coils shall be AHRI rated. Provide coils with thickest fin option. Provide coils with manufacturer applied coating to protect against salt air corrosion. Drain pans in chilled water coil section shall be stainless steel and constructed in compliance with ASHRAE Standard 62.1. Maximum face velocity for chilled water coils shall be 500 fpm.

Air-handling unit fans shall be direct drive plenum type, minimum Class II fan construction. Air-handling units greater than 20,000 CFM shall use at least two supply fans. Select fan and motor with pre-filter and main filter both at dirty filter conditions.

**4.11.3 Heating Water Boilers**

Boilers shall be certified and listed in accordance with AHRI.

UL Compliance: Boilers must be tested for compliance with UL 834, "Standard for Heating, Water Supply, and Power Boilers-Electric" Boilers shall be listed and labeled by a testing

agency acceptable to authorities having jurisdiction.

ASME Compliance: Condensing boilers must be constructed in accordance with ASME Boiler and Pressure Vessel Code, Section IV "Heating Boilers".

Minimum of two boilers each sized at minimum 75 percent of design peak plant demand.

Stage boilers to provide maximum plant efficiency while maintaining minimum recommended flow rates through operating boilers.

Provide boilers to support variable-primary flow system configuration. Provide heating water boilers that do not require constant volume circulators.

Pipe boilers in reverse-return configuration at the boiler plant. Provide balancing valves on the low-pressure side of each boiler. Provide motor-operated isolation valves at each boiler to automatically shut-down flow through non-firing boiler.

Provide control interface to the BAS system.

**4.11.4 Circulating Pumps**

- Use split-coupled vertical in-line pumps
- Provide at least one pump to meet design flow condition and at least one back-up pump for all system types. Program pumps to alternate between operating duty and backup duty to equalize runtime.

**4.11.5 Water-Source Heat Pumps (WSHP)**

Water-Source Heat Pump systems may use either tower/boiler water loop.

WSHP units 6-tons and smaller shall be use two-stage compressors and have an electronically commutated supply fan motor capable of automatically changing fan speed in

**SECTION 4 - PERFORMANCE REQUIREMENTS**

response to space temperature demand. Size WSHP zones to maintain unit sizes no greater than 6 tons.

**4.11.6 Chilled Beams**

Chilled beam systems shall include temperature sensors and control algorithms to prevent condensation.

**4.11.7 HVAC Controls**

All HVAC equipment shall be fully integrated into a Building Automation System (BAS). All control set points shall be able to be viewed and remotely changed from the BAS operator workstation. Control and monitoring points available through equipment manufacturer's controller (including, but not limited to chillers, boilers, packaged DX-equipment, computer room units, etc.) shall be fully integrated with the DDC control system. This shall include all instrumentation and interface points.

All equipment shall operate on the local BAS controller or integrated packaged unit manufacturer's controller. The unit controllers and packaged equipment controllers shall have two way communication with the BAS and allow all control functions, alarms, operating schedules, set points, set point adjustment, optimum start and optimum stop sequences relayed to the BAS using BACnet protocol. The unit controller shall retain programming, schedules, and set points in the event of a power loss. Critical HVAC equipment shall have its control system on backup battery and emergency generator. A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.

Provide control products including controllers, sensors, actuators, control dampers and devices required to make a complete and

functional control system. Provide air measuring stations for outside air intake.

Provide items for operating and controlling heating, cooling, ventilating, systems and equipment for energy management and conservation. Include piping, wiring, conduit, control panels, thermostats, timers, and recording and alarm devices. Interlock controls with site BAS. System and components must be BACnet compliant.

**4.11.8 Energy Metering**

All energy meters shall report both consumption and demand for each system and sub-system listed. Energy data shall be fully integrated into the BAS. The BAS controls contractor shall be responsible for ensuring all connections from the energy meters to the BAS system are made and are fully functional. Provide separate electrical meters for:

Process power loads such as lighting must be metered and monitored by BAS separate from normal building consumption to have a comparable baseline between actual energy consumption and modeled energy.

Provide and monitor heating water system Btu meter for each unique boiler plant. Provide and monitor chilled water system Btu meter if applicable. Water flow meters shall be in-line electromagnetic type.

Provide and monitor domestic water meter(s).

The power monitoring system shall monitor points in power distribution system and be able to provide local and remote readings. The power monitoring system shall, through software on a personal computer workstation and be able to monitor multiple devices at one time. The electronic meters shall provide metering values such as frequency,

current, voltage, power factor, power, demand current and real power, and accumulated real and reactive energy. Meters shall retain historical circuit data, time and date, setup and configuration values, and diagnostics data in the event of a control power failure, without the need for an internal battery. Meters shall be installed in all switchboards, switchgear, emergency power distribution devices and selected panelboards to obtain a clear understanding of the power consumption within the facility. Meter locations shall allow the user to monitor, track and produce reports of the energy usage of the Operations, Operator, SFMTA and any other tenant within the facility. The metering software shall be able to be installed on multiple devices, personal computers, as required.

The monitoring system shall provide the needed information for the PNC to develop and maintain an energy model and energy management plan.

**4.11.9 Systems Testing and Balancing**

Piping and Air Systems Testing, Adjusting and Balancing: Testing, adjusting and balancing agent must be AABC, NEBB or TABB certified. Makeup air units, exhaust fans, and air distribution system to be balanced in accordance with certifying agency standards. All system controls operation to be verified. Assist the Commissioning Provider as needed.

**4.11.10 Building Automated System**

The Building Automated System (BAS) shall be non-proprietary open protocol, BAC-net capable, and designed to be fully interoperable the existing SFMTA network of BMS systems presently functioning in other buildings. The PPC will coordinate with the SFMTA with respect to the SFMTA's established BAS

## SECTION 4 - PERFORMANCE REQUIREMENTS

system architecture, as well as standards and procedures in how to automate, record and track building systems and their performance over time. This shall include the ability for the SFMTA to monitor and manage the Facility's BAS system remotely using any PC that is connected to the SFMTA BAS internal network. The BMS shall be developed in coordination with the Project's Building Information Model (BIM).

## 4.12 Fire Protection

**General:**

The Bus Yard Component and Common Infrastructure shall be fully protected with automatic fire suppression systems including wet and dry pipe automatic sprinklers, in-rack or ESFR sprinklers in high rack storage area, and fire department standpipe hose valve stations, and clean agent gas fire suppression systems.

A minimum of two fire department connections (FDC) shall be provided for the Facility on separate streets in locations approved by the San Francisco Fire Department (SFFD), each FDC shall be located within 100 feet of a fire hydrant. Provide FDC signage as required by the SFFD.

Provide a complete sprinkler system design, including sprinklers, branch lines, floor mains and risers, shown on the drawings. The sprinkler system plans shall include node and pipe identification used in the hydraulic calculations. Shop drawings, seismic and hydraulic calculations shall be provided as specified in NFPA 13 and 14. Fire suppression system permit plans and hydraulic calculations shall be sealed by an appropriately licensed fire protection contractor.

## 4.12.1 Fire Pump

Conduct a fire water flow test prior to design. If the fire flow test demonstrates insufficient water supply to satisfy the expected fire suppression demands coordinate with the City necessary infrastructure upgrades. A fire booster pump system shall be provided to supply fire water to the Project.

- A jockey pump shall be provided to maintain the system pressure.
- Fire pump shall be provided with both a test header and a closed test loop with flow meter.
- Fire pump shall be provided with an automatic transfer switch to transfer power from the building emergency generator. A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.

**Sprinklers:**

- Office Areas, Toilet Rooms, Locker Rooms, Lounges, Conference Rooms and similar type areas shall be designed based on Light Hazard Occupancy. The minimum design density shall be 0.10 GPM/sf over the hydraulically most remote 1500 sf with a maximum sprinkler spacing of 225 sf. Hose stream allowance shall be 100 GPM.
- Office Storage Rooms, Custodial Rooms, Mechanical and Electrical Rooms and similar type areas shall be designed based on Ordinary Hazard Group 1 Occupancy. The minimum design density shall be 0.15 GPM/sf over the hydraulically most remote 1500 sf with a maximum sprinkler spacing of 130 sf. Hose stream allowance shall be 250 GPM.
- Shops and Service Areas (Non-Vehicle Maintenance) and similar type areas shall be designed based on Ordinary Hazard Group 1

Occupancy. The minimum design density shall be 0.15 GPM/sf over the hydraulically most remote 1500 sf with a maximum sprinkler spacing of 130 sf. Hose stream allowance shall be 250 GPM.

- Vehicle Maintenance Shops and Service Areas and similar type areas shall be designed based on Ordinary Hazard Group 2 Occupancy. The minimum design density shall be 0.20 GPM/sf over the hydraulically most remote 1500 sf with a maximum sprinkler spacing of 130 sf. Hose stream allowance shall be 250 GPM. The fire system in the main shop shall be designed to shut down the high voltage traction power instantaneously when the sprinkler or standpipe system is activated.
- Loading docks and building canopies with storage or vehicles parked beneath shall be provided with dry pipe automatic sprinkler systems with design based on Ordinary Hazard Group 2 Occupancy. The minimum design density shall be 0.20 GPM/sf over the hydraulically most remote 1950 sf or largest room, whichever is less, with a maximum sprinkler spacing of 130 sf. Hose stream allowance shall be 250 GPM.
- Storage areas with storage 12-feet or less high shall be based on protection of Class IV encapsulated commodities stored on racks up to 12-feet high. Automatic sprinkler design shall be based Miscellaneous Storage, Extra Hazard Group 1, with minimum design density shall be 0.30 GPM/sf over the hydraulically most remote 2500 sf with a maximum sprinkler spacing of 100 sf.
- Storage areas with high rack storage above 12-feet high shall be based on protection of Class IV encapsulated commodities. High

## SECTION 4 - PERFORMANCE REQUIREMENTS

hazard commodities, such as rubber tires, Group A plastics, flammable liquids, idle pallets and similar commodities shall not exceed a height of 5-feet, stored on racks spaced 8-feet or greater apart, with storage up to a maximum height of 20-feet high. Automatic sprinkler design shall be based on in-rack sprinklers accordance with NFPA 13 with a maximum sprinkler spacing of 100 sf for ceiling sprinklers. Comply with NFPA 13 for ESFR coverage if used.

- In addition to the sprinkler systems, Maintenance, Inspection, Service and High Rack Storage (over 12-feet high) Areas shall be provided with a 2-1/2-inch fire department valve stations including a 2-1/2-inch angle valve with a capped outlet for fire department hose connection.
- For dry automatic sprinkler systems, the hydraulically most remote area shall be increased 30 percent.
- Dispatch and IT Server Rooms shall be provided with clean agent fire extinguishing gas system.
- Heads shall be centered in ceiling tiles where acoustical ceiling tile is present. Two-piece adjustable escutcheons and extended coverage heads are prohibited.

**Clean Agent Fire Suppression:**

- Clean agent fire suppression systems shall be provided in Communication Rooms, Data Rooms and Computer Rooms where critical or high cost computer/network equipment is present. Clean agent suppression system shall be either fluorinated ketone (PFC) type clean agent or an inert gas system.

- Provide back-up wet automatic sprinkler systems in rooms with clean agent unless required by AHJ. If wet system is required, system shall be a preaction type dry system.

**Standpipes:**

- A Class 1 Standpipe system shall be provided throughout the Facility for Fire department access. Provide 2-1/2-inch fire department valves in accordance with NFPA 14.
- Initial coordination with San Francisco Fire Department indicated their preference for standpipes to be provided to the roof. Walkways and ladders will be requested to provide access to locations inaccessible to ladder trucks due to the presence of track, OCS wiring, or adjacent buildings.
- Automatic shutdown of OCS power systems shall be provided in response to fire detection or activation of fire suppression system.

**Fire Suppression Piping:**

- Fire water service from the existing site fire water main shall be routed below grade to provide service to each building. Underground fire service from inside 5-feet of the building to inside shall be ductile iron or stainless steel. Underground service shall be wrapped in accordance with AWWA C105.
- Schedule 40 black steel pipe with threaded ends, ductile or malleable iron fittings for piping 2-inch and smaller. Schedule 40 black steel pipe with roll-grooved ends and uncoated fittings for piping 2-1/2-inch and larger. Dry pipe sprinkler system piping shall be Schedule 40, galvanized steel.

**Fire Alarm and Supervisory Systems:**

- Automatic sprinkler water flow alarm(s) shall be provided and connected to the fire alarm

system and transmit a water flow alarm to the Fire Department and building fire alarm. Sprinkler valve tamper switches shall transmit a trouble alarm to the Fire Department and provide a local audible signal. Sprinkler systems shall have inspector's tests stations. Coordinate monitoring of tamper and flow switches with fire alarm contractor.

**4.12.3 Fire Protection Specialties**

Provide firefighting devices and storage cabinets, not including items or devices physically connected to a fire protection system. Include the following:

- Fire Extinguishers (FE) on brackets attached to wall.
- Fire Extinguisher Cabinets (FEC).
- Signage and Pavement Markings.
- Fire Department Key Box. As required by SFFD.

**4.13 Electrical****General:**

- The PPC shall design, permit and construct all power, lighting, control, communications, fire alarm, and security systems as described in all Sections of this Design Criteria. All work shall be in accordance with the listed Criteria. The Electrical Scope of Work shall include, but not be limited to:
  - ✓ Site investigation to examine existing conditions
  - ✓ Coordination with PG&E, the SFMTA representatives, building department, and other AHJ.
  - ✓ Preparation of Construction Documents including drawings, calculations, analyses, protective device coordination, specifications, shop drawings and other

## SECTION 4 - PERFORMANCE REQUIREMENTS

- necessary documents to fully describe the electrical work and to prove compliance with the listed criteria.
- ✓ Design and construction of Electrical components in accordance with listed seismic design requirements.
- ✓ Preparation of forms and exhibits as required to show compliance with prescribed energy and sustainability codes, standards and guidelines.
- ✓ Completion of necessary forms and documentation for electrical permits and energy code compliance as it pertains to the electrical work.
- ✓ Work with the SFMTA IT Department to define the power for systems components. Define requirements for power and communication conduit to meet systems requirements.
- ✓ Coordinate all electrical design work with the mechanical designer(s) and Facility design engineers to ensure all items requiring electricity are connected as well as environmental conditions for equipment such as the UPS batteries are met.
- ✓ Coordinate between the elevator contractor and the electrical contractor work to meet all applicable local/state codes. This shall be delineated in the specifications and the design.
- ✓ Identify general location of equipment to define chases, duct-banks and support requirements to be included in building and structure. Provide information to architects and ensure that space is provided.
- ✓ Testing, coordination, observation, commissioning and reporting.

- ✓ Design and construction of BEB infrastructure, per Division 5 (*Battery-Electric Bus Supplemental Criteria*) of the Technical Requirements.
- ✓ Design and construction of electrical infrastructure and fit-out of electric non-revenue vehicle charging.
- ✓ Coordination, disconnection, and reconnection of OCS Traction Power system to support trolley bus charging.

**Calculations and Analyses:**

- Submit the following calculations and analyses, sealed by a Registered Professional Engineer:
  - ✓ Demand load as calculated per requirements of NFPA 70 Article 220.
  - ✓ Lighting Photometrics: Submit point-by-point calculations for 100 percent of the site and each unique room type in the buildings. Submit separate calculations proving compliance with NFPA 101 for emergency/egress lighting.
  - ✓ Emergency generator – provide calculations proving the capability of the proposed generator to serve the required emergency loads plus 25 percent spare capacity. The analysis shall assume the spare capacity load to be constant kVA load. Analysis shall include starting of motor loads as sequenced by the BAS. Calculations shall assume generator operation with diesel fuel source. A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.
  - ✓ Short circuit – provide calculated momentary (0.5 cycle) fault current values for all 15 kV and 480V busses, and

- 208/240V panels served from 75 kVA or larger transformers.
- ✓ Arc flash (hazard analysis, arc flash boundary, incident energy) – provide calculation results for all busses 150V (AC and DC) and greater.
- ✓ Voltage drop – provide calculations for the main building services, feeders longer than 50-feet, all site lighting branch circuits, and all branch circuits longer than 75-feet or loaded greater than 50 percent of the circuit rating.
- ✓ Protective device coordination – provide time-current curve (TCC) plots showing proper coordination of all panel main breakers with upline devices, coordination of switchboard feeder breakers with main breakers and coordination of switchboard main breakers with 15 kV feeder relaying.
- ✓ Fire Alarm – provide battery capacity calculations proving compliance with NFPA 72.
- ✓ UPS – provide battery capacity calculations.

**Building Electrical Service:**

- 480Y/277V shall be provided for the facility from the utility-owned transformer and electrical service. The service shall be sized using Appendix C as a guide, with final calculations provided and verified by the PPC. The building service shall be rated to carry 150 percent of the building demand load at 104 degrees F maximum, and 86 degrees F average daily temperature. The PPC shall accommodate any required electrical equipment for the building service in accordance with PG&E and SFPUC requirements.

## SECTION 4 - PERFORMANCE REQUIREMENTS

- Low voltage service from the PG&E service equipment to the building switchgear shall be routed in a concrete encased duct bank. Two spare conduits shall be provided.

**4.13.1 Building Power Distribution**

- The building power distribution shall be organized substantially as presented in Appendix C, or as required by the SFPUC or PG&E in response to the Applications for Electrical Service initiated by the SFMTA. The main switchboard shall be rated for 150 percent of the building demand as calculated per NFPA 70 Article 220, 480Y/277V and provided with the following:
  - ✓ Copper phase bussing with a solidly grounded copper neutral bus and copper ground bus.
  - ✓ A main circuit breaker with intelligent solid-state LSIG trip units with data communications.
  - ✓ Fully rated feeder circuit breakers with solid-state intelligent LSIG trip units with data communications to serve the essential loads.
  - ✓ Fully rated feeder breakers with solid-state intelligent LSIG trip units for the shop and building distribution panelboards.
  - ✓ A digital power metering system capable of providing data to the BAS.
  - ✓ A Surge Protective Device integral to the switchboard, sized to protect all facility elements served through the switchboard.
  - ✓ Backup power for switch gear control circuit.
  - ✓ Transformers supplying non-linear loads will be K-rated.

- Building distribution shall be provided via a system of 480Y/277V circuit breaker distribution panelboards and a combination of 480Y/277V and 208Y/120V smaller branch panelboards. Electrical panels shall have copper buses with bolt-in circuit breakers. Plug-in circuit breakers will be allowed for circuit breaker sizes over 100 amperes where a positive locking device is available to retain the circuit breaker in place. Panelboards shall be provided with a main circuit breaker and shall be fully rated for anticipated fault current levels. Panelboards serving non-linear loads shall be furnished with a 200 percent rated neutral bus. Series rated circuit breakers shall not be used. All branch circuit and lighting panelboards shall be fully populated with circuit breakers. 20 percent of the circuit breakers in each panel shall be spares. Distribution panelboards shall have spare spaces amounting to 20 percent of the total breaker space. Conductors for all power circuits shall be THHN/THWN insulation.
- Sub-Metering: Building loads shall be sub-metered for energy consumption. Metering and data collection shall be provided as required for LEED EA Credit "Advanced Energy Metering". Load sub-categories shall also be metered.

**Interior Lighting:**

- All interior and exterior lighting shall employ fixtures with LED light sources. Interior lighting will generally be served at 277V in order to reduce circuit losses.
- Lighting in administrative areas shall typically be provided from LED direct/indirect grid troffers and recessed downlights. All spaces having a lay-in grid ceiling shall employ

recessed fixtures, except spaces with ceiling heights of 9-feet or greater may be provided with pendant/stem mounted linear direct/indirect architectural fixtures.

- Exit signs shall be internally illuminated LED type. The emergency lighting at the exterior egress doors shall be provided to illuminate the path of egress outside of the exit.
- Lighting in the maintenance, shop and warehouse areas shall be LED high-bay fixtures. Maintenance pit lighting shall be enclosed and gasketed 4-foot strip LED fixtures with IP66 rating. Fixtures shall be mounted on or adjacent to the track support structures, with provisions to allow the individual fixtures to be rotated by hand to any angle from +90 degrees to -90 degrees relative to horizontal.
- Individual offices, group offices and conference room lighting shall be controlled with dual-technology occupancy sensors and daylight dimming controls. Lighting in conference rooms and training rooms shall be designed to an average level of 30 foot-candles, and shall be dimmable to 5 percent of maximum output.
- Spaces without occupancy-based controls shall be provided with lighting controls that operate on a scheduled time-of-day basis with one or more override switches to selectively extend lighting past the scheduled shut-off time. All controls shall conform to ASHRAE 90.1 guidelines.

**Engine Generator:**

- A diesel-fueled engine generator set shall provide power for the emergency/standby system loads. The presence of life safety loads requires the generator to be diesel

## SECTION 4 - PERFORMANCE REQUIREMENTS

powered. Generator set capacity shall be 125 percent of the calculated demand of the designated emergency loads. Provide a storage tank with a capacity to store 24 hours of fuel at a generator output of 100 percent of nameplate rating. See Section 4.8.1 for the resilience and recovery requirements for the facility. Provide the following accessories and options:

- ✓ IBC seismic certification.
- ✓ Corrosion-resistant sound attenuating enclosure.
- ✓ Lead-acid starting battery.
- ✓ Remote control/annunciator panel having all capabilities of the local control panel. The remote panel shall be located interior to the East in a normally-occupied space.
- ✓ Control panel shall have network communications capability.
- ✓ Engine block heater, jacket type heater for starting battery.
- ✓ Alarms for low LP fuel tank level.
- ✓ Alarm for low battery voltage.
- ✓ Alarm for battery charger failure.

The code-required emergency power for the lights will be provided from the generator. In addition to the emergency lighting load and other life safety loads, it is anticipated that the generator may be designed to carry additional loads within the facility. IT/communications systems, some HVAC loads, some bus charging loads, and some industrial equipment loads may be connected to the generator. The exact composition of the emergency loading will be coordinated with the SFMTA during the design phase. This loading will drive the generator sizing to handle the load and methods of facility operation in accordance with the SFMTA requirements. Some luminaries

may be connected to the generator to provide operational lighting in the event of a power outage.

Items that must be on emergency power:

**Life Safety Loads:**

- Pathway egress lighting
- Exit lighting
- Fire alarm systems
- Other loads to ensure human life safety

**Critical Electrical Loads:**

- IT/Data rooms and systems
- Security systems
- Communications systems
- HVAC equipment serving these spaces
- HVAC control system
- Elevator(s)
- Fume ventilation systems

**Additional Emergency Loads:**

- Automatic garage door openers at entrances and exits of building.

**Optional Emergency Loads:**

- Compressor(s) and dryer(s).
- Lube pumps - the SFMTA with the assistance of the design team to specify during the PDA design phase.
- Four maintenance bays - SFMTA will the assistance of the design team to specify during the PDA design phase.
- Section 4, Sitework, describes the SFMTA coordination underway with PSE to provide separate power feeders to the East site and the E335 TPSS.

**Automatic Transfer Switches/Load Bank:**

- Multiple automatic transfer switches (ATS) shall be provided to transfer loads between the normal power system and the emergency

power system. Loads shall be assigned to the ATS in accordance with NEC Article 700. Provide a load bank to allow exercising the generator under load without interruption of the building emergency loads. The load bank shall be sized at 100 percent of the maximum generator rating and shall have a step load capability in increments of 25 percent, 50 percent, 75 percent and 100 percent of the load bank rating. A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.

**UPS System:**

- Loads which cannot tolerate more than a ¼ cycle interruption shall be provided with internal or dedicated battery backup and/or connected to a central UPS or inverter system. These loads include, but are not limited to:
  - ✓ Fire alarm systems (battery).
  - ✓ CCTV systems (UPS).
  - ✓ Telecommunications equipment (UPS).
  - ✓ Emergency Telephone System (ETEL) (UPS).
  - ✓ AC/DC switchgear controls (battery).
  - ✓ BAS PLC (UPS).
  - ✓ Access control (UPS).
- The building UPS systems shall be sized to serve the anticipated demand load plus spare capacity of 25 percent. The UPS batteries shall be sized to carry the maximum UPS rated load for a period of 90 minutes. The PPC shall submit calculations which support the required size of the UPS and batteries. The UPS input shall be fed from the generator or the secondary utility feed for continued operation following the rated load period of

## SECTION 4 - PERFORMANCE REQUIREMENTS

90 minutes. A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.

**Service & Distribution:**

- Dry-type distribution transformers shall be utilized to provide the 208Y/120V service to the branch panelboards serving the convenience receptacle and small motor loads. All dry-type distribution transformers shall be energy efficient type having the Energy Star rating. Dry-type transformers shall be VPI insulated. Indoor dry-type transformers shall have copper windings, 220 degrees C insulation and shall have a maximum winding temperature rise of 115 degrees C above an ambient temperature of 40 degrees C. Where transformers serve a significant amount of non-linear loads, the transformers shall have a "K" rating to handle the additional heating caused by high-harmonic load content. The neutral of secondary feeders from K-rated transformers shall be sized at 200 percent of the ampacity of the phase conductors.

**Disconnecting Means:**

- Receptacles for all small equipment loads may serve as the disconnecting means. 480V and 208V loads shall be provided with a disconnect (safety) switch with means to padlock disconnect in the off position. All safety switches shall be heavy-duty type. Transformers not located within eyesight of their source panel shall be provided with a disconnect (safety) switch on the primary side of the transformer.
- Motor loads ½ horsepower and larger shall be served at 480V 3 phase. Small fractional horsepower motors shall be served at 120V

1 phase. Shop equipment loads shall be served at 480V 3 phase, 208V 3 phase, 208V 1 phase, or 120V 1 phase as per their requirements. Convenience receptacles shall be served at 120V 1 phase.

- Welding equipment shall be supplied from dedicated panelboards.

**Grounding:**

- A quality single-point grounding system shall be provided in the main electrical room consisting of a main grounding bus bar (MGB) connected to a building counterpoise. The building steel frame, water service entrance pipe (if metallic piping is used, electrical equipment ground conductors, isolated ground conductors, and telecommunications and data system ground shall be connected to the MGB. The Main Telecommunication Room (MTR) and each telecommunications room or telecommunications closet (TR/TC) shall be provided with a copper telecommunications ground bar (TGB). The Main Telecommunication Ground Bar (MTGB) shall be located in the MTR. A #3/0 AWG Telecommunication Bonding Backbone (TBB) shall connect the MTGB, the TGBs and the MGB. Grounding for communication circuits shall be in accordance with TIA/EIA J-STD 607 and Motorola R56 standards.
- All metal raceways shall include an equipment grounding conductor sized in accordance with NFPA 70.

**Lightning Protection:**

- PPC shall perform a risk assessment calculation as shown in NFPA 780, Annex L to assess the lightning risk to the facility. If the risk assessment recommends protection,

provide a UL Master Label lightning protection system in accordance with NFPA 780. Building lightning protection consisting of air terminals and down conductors shall be provided. The building counterpoise shall serve as the grounding electrode. Incoming copper telecommunications wiring shall be provided with individual gas-filled surge arrestors sacrificial pigtail connector to protect communications equipment and wiring for transient surges caused by lightning or other outside disturbances.

**4.13.2 Electrical System Sustainability**

The Project shall comply with all energy and electrical efficiency requirements in the San Francisco Municipal Green Building Code (Environment Code Chapter 7), which shall supersede the narrative provided in this DCD.

**Energy and Emissions:**

- The emergency generator shall be specified to meet EPA emission requirements for gaseous fueled engines.
- A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.

**Energy Efficiency:**

- Lighting shall be designed to minimize the electricity consumption required and will meet or exceed the requirements of ASHRAE 90.1 and state and local energy codes.
- Electrical motors shall be the premium efficiency type.
- Transformers shall meet or exceed NEMA minimum efficiency ratings.
- Lighting controls shall be employed to reduce energy consumption. Vacancy sensors shall be provided in offices, conference room and

## SECTION 4 - PERFORMANCE REQUIREMENTS

other similar areas. Occupancy sensors shall be provided in janitor's closets, bathroom, locker rooms and other similarly occupied spaces. Time of day lighting controls shall be provided to turn lighting off throughout the building at specific times specified by the building or department user. A two hour over ride switch shall be provided to allow the lighting to remain on if someone is working additional hours. Lighting shall be able to be switched to 50 percent level when building cleaning staff is on site so that building lights do not have to be fully energized for this task. If daylighting can be employed, daylighting sensors may be used to reduce the lighting in areas where there is sufficient daylight to perform the required tasks.

**Alternative Energy Sources:**

- Solar Power:
  - ✓ PPC shall integrate a photovoltaic (PV) power system installation, consistent with the Municipal Green Building Code.
  - ✓ The PV system installation shall conform to NFPA 70 Article 690 and requirements of PG&E.
  - ✓ PV system shall supply power to the BYC. PV connection to the CIC is also acceptable.
- Battery Storage:
  - ✓ PPC is encouraged to include on-site battery storage to maximum on-site power generation and storage potential to provide emergency backup power for the BYC or the future BEB fleet specifically.

**Commercial Equipment:**

- PPC shall coordinate with third party commercial suppliers of vending machines,

wash soap, fluids utilized in maintenance shops, sand, parts suppliers and any other commercial supplier as indicated by the SFMTA to determine space and access requirements and incorporate this information into the facility layout.

**4.13.3 General Arrangement and Infrastructure Requirements**

- Special attention shall be made to ensure that equipment provided meets the requirements of the SFMTA prescriptive specifications and is fully compatible in form, fit and function with existing equipment as defined. Conduit in interior shop areas, external locations, the storage building or any locations subject to potential damage shall be rigid conduit. Conduit in interior office areas shall be EMT conduit.

**4.13.4 Telecommunication Rooms and Closets**

- The Telecommunication Room for each floor shall be environmentally controlled with HVAC equipment, lighted and fire protected. The Telecommunication Room shall be provided with keycard access and intrusion detection.
- Main Communication Room shall have all HVAC equipment requirements needed to keep the room and systems cool.
- In addition to the Telecommunication Rooms, the PPC shall provide IT closets as required to ensure that raceway runs from data outlet or Ethernet connected equipment to the Telecommunication room or the nearest IT closet is not more than 275-feet.
- IT closets, if provided, shall have louvered doors to facilitate heat transfer from the room. Powered and temperature controlled exhaust fans are required for each IT closet if the IT

closet electronics consumes over 80 watts of power.

- Lighting shall be configured parallel and in the front and back of all PPC and the SFMTA required racks.
- Space and lighting requirements, including clearance in front and back of racks, in the Telecommunication rooms and closets shall conform to the latest version at time of notice to proceed of the Building Industry Consultants Service Industry Transmission Distribution Methods Manual (BICSI TDMM).
- An AC sub-panel with a separate 20A 120V breakers for each equipment rack (five (5) racks per room) shall be provided for the IT room. This sub-panel shall be supplied by the standby power circuit. Four (4) wall mounted 20A 120V convenience receptacles shall be provided in the Telecommunication room and one in each IT closet.
- Cable trays shall be provided along the perimeter of the Telecommunication room and over the planned location of the five (5) racks to support all required cabling systems. Cable trays shall be sized for maximum 40 percent fill; minimum width shall be 9-inches.
- Where ceilings are provided, control conduits and wiring will be run as high above the ceiling as possible to allow easy removal of ceiling tiles without interference due to control or communication subsystems.
- Cable runs above ceilings which are not in cable trays shall be supported by J-hooks specifically manufactured for supporting cable systems.
- For basis of design, the cooling provision of 20 tons shall be used. Actual heat loads and

## SECTION 4 - PERFORMANCE REQUIREMENTS

cooling equipment sizing shall be determined during final design.

- Telecommunications Rooms shall house the incoming telecom service conductors, the PPC shall provide or install IT/ Communications conductors or fiber optic cables, the E750 PPC shall provide and install fiber optic cables, and owner provided telecommunications switch, horizontal cross connects and equipment racks.

**4.13.5 Phone Jacks and Cabling**

- Phone Jacks and Cabling are limited to the communications methods of the FACP to the remote Supervising Station and to the telephone and monitoring of the elevator(s).

**4.13.6 Network Ethernet Switches**

- The PPC shall coordinate with the SFMTA IT prior to design of the Data Room and TR/TCs for the space, power, cooling, bonding and other requirements of the SFMTA IT Network Ethernet Switches and other equipment.
- The SFMTA will install Network Ethernet Switches and other equipment in the Data Room and TR/TCs referenced in this chapter during the warranty period. The PPC shall not invalidate the warranty based on the SFMTA Network Ethernet Switches and other equipment installation.

**4.13.7 IT Servers**

- The PPC shall coordinate with the SFMTA IT prior to design of the Data Room and TR/TCs for the space, power, cooling, bonding and other requirements of the SFMTA IT servers and other equipment.
- The SFMTA will install IT Servers and other equipment in the Data Room and TR/TCs referenced in this chapter during the warranty

period. The PPC shall not invalidate the warranty based on the SFMTA IT Servers and other equipment installation.

**4.13.8 IT Equipment Procurement**

- Customized IT systems such as Radio, Computer Aired Dispatching, Access Control, Cameras, Fleet Watch (including antenna location to capture bus information), and others shall be addressed in detailed design and equipment procurement in coordination with the SFMTA. The SFMTA expects that available IT infrastructure may evolve by the time construction is completed and therefore will do a final review of the IT equipment and supporting infrastructure prior to their ordering and installation.

**4.13.9 Closed Circuit Television System (CCTV)**

- The PPC will work with SFMTA Security staff to ensure all camera locations are correct and that camera views meet their needs. The PPC shall design the quantity and location of cameras for the CCTV system using APTA IT-CCTV-RP-001-11," APTA Recommended Practice for the Selection of Cameras, Digital Recording Systems, Digital High-Speed Networks and Trainlines for Use in Transit-Related CCTV Systems".
- Camera views will be selected based on their function, location and resolution. The PPC shall submit the CCTV design site plan that shows camera locations, coverage, camera function and the camera model for each location. Submittal shall also include required views generated from the project 3D model from each camera location. The camera design layout shall be approved by SFMTA Security staff prior to implementation.

Once the design is approved, no changes shall be made without SFMTA Security staff's acceptance.

- The CCTV system shall be compatible with and integrated into the SFMTA's existing Genetec CCTV system. The PPC's price shall allow for one version upgrade of the cameras beyond software version at time of installation. The PPC shall coordinate with SFMTA to access and update the CCTV central servers.
- The PPC shall provide all raceway, cabling, cameras, and mounting hardware/poles. Cameras shall be mounted in locations where maintenance staff can access without requiring fall protection.
- The PPC shall provide fixed view (unless otherwise identified) CCTV coverage to the following areas at a minimum:
  - ✓ The complete site perimeter shall be covered with cameras installed no greater than 200-feet apart oriented in an overlapping field of view configuration with resolution sufficient for security personnel to determine what is present by class (animal, blowing debris or person).
  - ✓ Entrances and exits into facility site shall be covered. All vehicle and pedestrian access points shall be covered with two dedicated fixed wide angle cameras with a resolution sufficient to uniquely identify an object on the basis of appearance (John, not Tom). One camera will be focused on the individual attempting to access the facility and the other camera will be focused on vehicle license plates.
  - ✓ All exterior building access points including vehicle, and pedestrian, shall be covered from the outside with a resolution

## SECTION 4 - PERFORMANCE REQUIREMENTS

- sufficient to uniquely identify an object on the basis of appearance.
- ✓ The loading dock(s) shall be covered.
- ✓ Parking areas shall each be covered with a minimum of two dedicated fixed cameras with overlapping coverage and shall have resolution sufficient for security personnel to determine what is present by class (animal, blowing debris or person).
- ✓ Note that additional cameras may be required for other systems outside of this CCTV section of the project requirements.
- ✓ Coordinate with the SFMTA security for areas that may require additional cameras due to high probability of intrusions.
- Existing SFMTA camera monitoring stations shall be configured by the PPC.

**4.13.10 Fire Alarm System**

- The Fire Alarm System shall be furnished and installed in the building conforming to NFPA 72. The system shall be looped, Class A, addressable, intelligent and supervised with a Fire Alarm Control Panel located in the main electrical room. The system shall be programmable, configurable and expandable in the field without the need for special tools, PROM programmers or PC-based programmers. Network communications capability over both a LAN or WAN shall be provided.
- The Supervising Station shall be a third party and shall conform to NFPA 72 as accepted by the AHJ and approved by the SFMTA. Communications Methods between the Supervising Station and the SFMTA in compliance with NFPA 72. The fire alarm control panel shall interface with the BAS system for general fire alarms.

- Photoelectric duct detectors will be provided in Air Handling Units when required by code. In accordance with NFPA 72 and the ADA, combination audible/visual notification devices will be installed throughout the facility to provide notification of an alarm. Visual devices shall be synchronized when more than one device is located in a common field of view. Tamper and flow switches shall be provided for the sprinkler system at the fire risers, valve pits and at the zone valves. Weatherproof exterior speakers shall be provided at exterior gathering locations and entrances to the buildings. An addressable analog fire alarm system with voice alarm shall be provided. A graphical annunciator panel showing the building floor plan depicting the location and status of all fire reporting devices shall be provided at the dedicated entrance to be used by firefighting personnel to respond to emergencies. A remote annunciator for the emergency generator set and elevator shall also be provided.
- A diesel-fueled engine generator set shall provide power for the emergency/standby system loads.
- Pull stations shall be provided at exits and spaced so that there are no more than 100-feet of travel from any point to a pull station.
- Analog smoke detectors which allow the fire alarm system to automatically adjust the detector sensitivity shall be used except where nuisance tripping may occur. In areas where smoke detectors would be unsuitable, such as elevator machine rooms, combination heat and rate-of-rise detectors shall be used. Smoke detectors shall be installed in electrical

- rooms, telecommunications rooms, elevator lobbies, yard control, under raised computer floors, and other areas of high importance. Smoke detectors shall be provided in the return air ducts of the HVAC equipment to provide for automatic shutdown of these systems when smoke is detected.
- The fire alarm system shall monitor the automatic fire suppression system for water flow, air pressure (if a dry pipe system is installed), and OS&Y valve position. Water flow detection shall initiate a building evacuation alarm. Loss of air pressure and closed valves shall initiate a trouble signal at the main fire alarm panel and at the annunciator.
- The annunciator shall monitor the position of the elevators and indicate if they are operational.
- Control of the building emergency ventilation (if provided) shall be available at the fire alarm panel and at the annunciator.

**4.13.11 Communications Server and Workstation Network Interfacing**

- Network Interface: Two separate network interface cards (NICs) with 1G bit/sec minimum speed capability each.
- Network Segment Assignment Options:
  - ✓ Define different network segment assignments for each of the NICs.
  - ✓ Define different network segment assignments on the same NIC.

**4.13.12 Outdoor Devices**

- All electronic devices use in an outdoor environment shall be rated to IP66 level, and withstand operating to three standard deviations of temperature maximum and minimums for this region.

**SECTION 4 - PERFORMANCE REQUIREMENTS**

- Rain shields over electronic devices shall be used in most cases of installation for further protection and improved endpoint device function.

**4.13.13 Network Management Capabilities**

- PPC shall implement all devices to be compatible with Standard Network management health status reporting via SolarWinds Event and Log Monitor software, or otherwise directed by the SFMTA. Devices shall be SNMPv3 compatible.
- PPC shall obtain written direction prior to implementing network connection devices, for instruction herein.

## SECTION 4 - PERFORMANCE REQUIREMENTS

**4.14 Wind Study**

- Pursuant to the City's wind ordinance (Planning Code Section 148), the Project is required to comply with wind comfort and hazard criteria set forth by the City. Wind analysis has been completed by the SFMTA for the RDC, which is Document 17 (*CEQA Pedestrian Wind Study*) of the Reference Documents. The RDC wind analysis determined that the Project would require design interventions to meet the wind criteria. The Project will be required to complete an updated wind study based on the PPC's proposed massing for the Facility.

**4.15 Strategies for Stormwater Handling and Treatment/Pre-Treatment**

- Stormwater runoff generated by the Project area must be treated in accordance with the City of San Francisco Stormwater Management Requirements (SMR). The PPC shall create a stormwater management plan meeting the City's SMR that emphasizes use of best management practices (BMPs) on site to mitigate stormwater quality and quantity concerns. Of particular concern, discharge containing oil, sediments, soaps, or other chemicals from the Bus Yard Component shall be captured and means for filtering and treating water prior to discharge shall be incorporated.
- Following the guidance from the City of San Francisco, preference shall be first for rainwater harvesting and reuse, bioretention and infiltration, and permeable pavement to reduce runoff, followed by detention and treatment through lined bioretention or a constructed wetland. The proposed solution shall acknowledge the different sources

of runoff on the site and demonstrate an appropriate management plan for each.

- The size of the Project necessitates compliance with San Francisco Article 12C Non-potable Water Ordinance as well. Based on the Project size, a non-potable water system is required on-site to treat and reuse available greywater, rainwater, and foundation drainage for toilet and urinal flushing. The PPC shall propose where such a system shall be housed and identify which uses within the Facility are required to be served by the resulting treated greywater. This necessarily must integrate the stormwater management solutions with on-site treatment and reuse for a comprehensive water management system for the Project.

**4.16 Evaluation of Life Cycle Cost Analysis**

Decisions impacting resource use, maintenance, and capital cost, such as HVAC system choice, envelope materials and selection, etc., shall be evaluated using a life-cycle cost analysis framework. This approach shall include, at a minimum, the following factors:

- Capital cost
- Energy (electricity, gas, thermal) cost savings
- Water cost savings
- Operations, maintenance, and replacement cost impacts
- Applicable incentives such as tax credits and depreciation benefits
- Space savings

For decisions impacting the Bus Yard Component, the Common Infrastructure, and the Housing and Commercial Component, separate life-cycle cost analysis studies shall be performed indicating the impact to each

component individually. Decisions impacting only one of the components may be evaluated in isolation. The period of evaluation shall be assumed to be no less than 30 years and shall be reviewed and confirmed with the City at the outset of the PDA phase. Life-cycle cost analysis evaluation financial parameters shall be determined by the PPC and shall be reviewed and confirmed with the City at the outset of the PDA phase. Financial parameters shall include discount rate, energy cost escalation, water cost escalation, labor and materials escalation, and applicable tax rate (if depreciation is evaluated for a measure) at a minimum. Decisions shall prioritize life-cycle cost benefit as a key driver of selection.

**SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES**

This document presents the Requirements for Bus Yard Component Space Modules for the proposed Potrero Yard, by providing both micro and macro level design requirements. The Requirements for Bus Yard Component Space Modules format found in this section consists of Functional Area Modules. The Functional Area Module represents a detailed description of specific design issues for each of the areas listed in Section 2 the Space Needs Program. Reference the Space Needs Program (Section 2.4) for specific data. All Modules and related equipment are for representation purposes only and do not necessarily depict strict design conformance.

**5.0 MODULES**

Each of the building space modules contains information regarding the function of the space, affinities, critical dimension (if any), equipment, furnishings, and finishes related to this operation. Technical considerations for architectural, structural, mechanical, plumbing, and electrical systems are delineated on the facing page. The space is graphically illustrated. Specific layouts of each area will be developed during detailed design. Note that the equipment and furnishings listed are not intended to be all-inclusive. Spaces are separated into groups based upon function.

Not all spaces listed in the Space Needs Program have a room data sheet including Custodial, Telecommunication Rooms, and Restrooms. This is because these spaces are code- or facility-specific, or are continually changing.

The following module colors are used in the room data sheets that follow as well as the Reference Design Concept plan sheets.

- OFFICE MODULES
- PARKING
- BAYS AND SHOPS
- FARE BOX AND CLIPPER CARD READER REPAIR SHOP
- SERVICE AND CLEAN
- PARTS
- MAINTENANCE - ADMINISTRATION
- OPERATIONS - ADMINISTRATION
- TRANSIT SERVICES
- SHARED
- TRAINING

**5.1 Sustainable Design**

There are several sustainable design opportunities that can be implemented at Potrero Yard. The Sustainable Design section outlines potential sustainable design opportunities appropriate for this type of facility. These options are broken into Site Features, Building Design and Materials, Mechanical Systems, Electrical Systems, and Plumbing Systems. The PPC shall also refer to Department of Building Inspection Form GS6: San Francisco Green Building Submittal Form for Municipal Projects for guidance on required measures.

**5.2 Utilities Design**

The utilities for the maintenance facility are numerous and require close attention to detail. The coordination of the HVAC, electrical, and plumbing systems are critical to the proper function of the Shop and the heart of the facility. Providing an organized installation and design of these systems will enhance future system maintenance.

## SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES

**5.3 Creating Sustainable Facilities**

Sustainability is an essential and fundamental component of the facility. The key sustainability issues that shall be explored in the planning and development of the facility include, but are not limited to, key points included in this section.

**5.3.1 Balance Between Economic and Environmental Needs**

To balance both economic and environmental needs, the facility design shall maximize employee health, safety, and operation efficiencies. This priority shall be considered at all stages of development of the facility.

**5.3.2 Efficient Use of Resource Materials**

Material resources are valuable, and efficient use shall be encouraged in the development and operations of the facility. This can be implemented with reusable, recyclable, and biodegradable materials, as well as mandating the use of products that are extracted, harvested, and manufactured locally.

**5.3.3 Efficient Use of Water Resources**

The facility plan shall encourage efficient use of water resources through resourceful planning. Examples could include implementing an effective storm water management plan and using environmentally compliant wash bays to service all vehicles. Reclaimed water will be used for irrigation at new City facilities, per the San Francisco Green Building Code Amendments and GS6 Form for municipal projects. Low flow plumbing fixtures and sub-metering are also required.

**5.3.4 Energy Efficiency/Renewable Energy Systems**

Renewable energy sources like solar, wind, and daylight harvesting shall be utilized, as well as exploring and promoting opportunities to increase energy savings at the facility through the use of high-performance systems.

**5.3.5 Construction Methods**

Methods of construction of the facility play a significant role in sustaining the environment. Minimizing transportation costs by utilizing local resources and recycling procedures during construction will conserve energy and minimize pollution.

**5.3.6 Sustainable Criteria**

The following is a list of potential strategies that contribute to sustainable building design:

- Operable windows/natural ventilation
- Occupancy sensors, vacancy sensors, lighting controls
- Lighting designed to meet targeted LEED points (Reference the LEED requirements in Chapter 7 of the City and County of San Francisco Environmental Code)
- Daylighting strategies and daylight harvesting
- User-adjustable comfort and lighting controls
- Underfloor ventilation
- In-floor radiant heating and cooling
- Water reclamation system
- Use of reclaimed water for vehicle washing
- Minimal landscaping along the north and south edges

**SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES**

**5.4 LEED Certifications**

LEED is a green building certification program that recognizes best-in-class building strategies and practices. To receive LEED certification, building projects satisfy prerequisites and earn points to achieve different levels of certification. Prerequisites and credits differ for each rating system, and teams choose the best fit for their project.

Each rating system groups requirements that address the unique needs of building and project types on their path towards LEED certification. Once a project team chooses a rating system, they'll use the appropriate credits to guide design and operational decisions.

SFMTA guidelines are to meet LEED Gold Certification, which shall include achieving a minimum of 12 points under LEED credit EAc2 Optimize Energy Performance and 3 points under LEED credit EAc5 Renewable Energy v4.1.

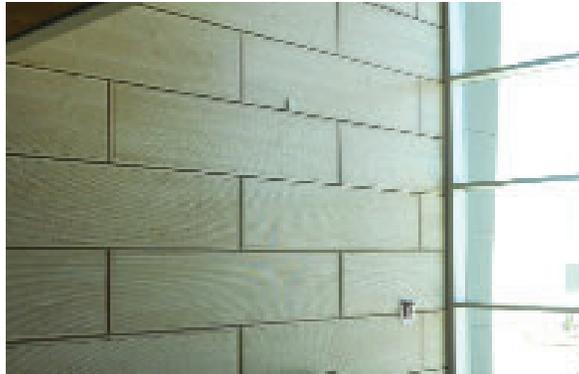

- Platinum 80+ points
- Gold 60 to 79 points
- Silver 50 to 59 points
- Certified 40 to 49 points

**5.5 Architectural Systems**

Design and materials that facilitate sustainability include, but are not limited to:

- Use of durable building materials
- Natural light
  - ✓ Skylights
  - ✓ Clerestory
  - ✓ Roof monitors
  - ✓ Windows in bay doors
- Operable windows for natural ventilation
- Low Volatile Organic Compound (VOC) finish materials

- Use of local building products
- Use of recycled materials
- High R-Value roof and wall insulation
- Insulated bay doors
- Low U-value windows and skylights

**Translucent clerestory windows daylighting**

**Insulated translucent sectional door**

**Solar tube daylighting**

**Light reflective floor**

**SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES**

**5.6 Mechanical Systems**

Mechanical systems that facilitate sustainability include, but are not limited to:

- Radiant floor slab heating
- Variable air volume air handling units
- Variable frequency drive motors
- High efficiency motors for air handling units and DX compressors
- Economizers for free cooling with 100 percent outside air at air handling units
- Demand control ventilation with CO2 and occupancy sensors for reducing ventilation requirements during unoccupied periods

**5.7 Additional Cost Alternatives**

- Radiant floor slab heating
- Solar Thermal heating for domestic water heater
- High efficiency boiler for hydronic heating loop
- Ground source heat pumps (geothermal)
- Destratification fans

Renewable energy production:

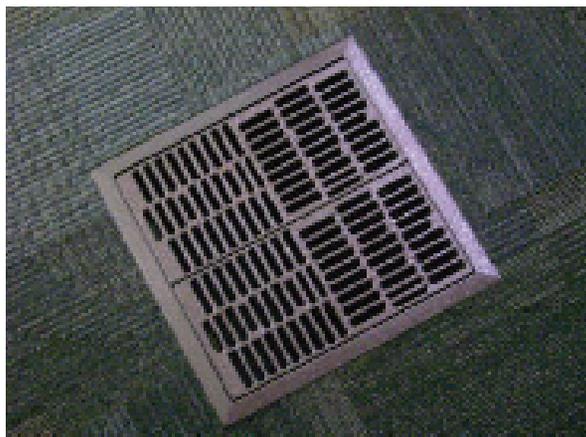

- Photovoltaic
- Wind

**Destratification fan**

**Heat recovery piping**

**Underfloor air distribution vent**

**Radiant floor system**

**SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES**

**5.8 Electrical Systems**

Electrical systems that facilitate sustainability include, but are not limited to:

- Photovoltaic panels to be installed on roof of building
- Maximize lighting controls with daylight harvesting and occupancy and vacancy sensors
- LED lighting systems
- Task lighting in Repair Bays
- Efficient process equipment

**5.9 Plumbing Systems**

Plumbing systems that facilitate sustainability include, but are not limited to:

- “We fix” program for new plumbing fixtures
- Rainwater harvesting for irrigation
- Vehicle wash water reclaim
- Low flow plumbing fixtures
- Sensor operated faucets
- Grey water (purple pipe) for water closets
- Tankless water heaters
- Reclaimed water will be used for landscaping at new City facilities, per the San Francisco Green Building Code Amendments and GS6 Form for municipal projects

LED lighting

Photovoltaic panels on roof

Dual flush toilet

Low-flow plumbing fixtures

Wash water reclamation system

Rainwater harvesting

**SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES****5.10 Architectural/Structural Systems Coordination**

- Coordinate routing, support systems, and clearances for mechanical ductwork, plumbing piping and electrical conduit
- Routing shall run above forklift and walk aisles
- Group wherever possible
- Route main ventilation ductwork above walk/ forklift aisles
- Use mezzanines for mechanical units

**5.10.1 Mechanical Systems Coordination**

- Route main ventilation ductwork above walk/ forklift aisles
- Use mezzanines for mechanical units

**5.10.2 Plumbing Systems Coordination**

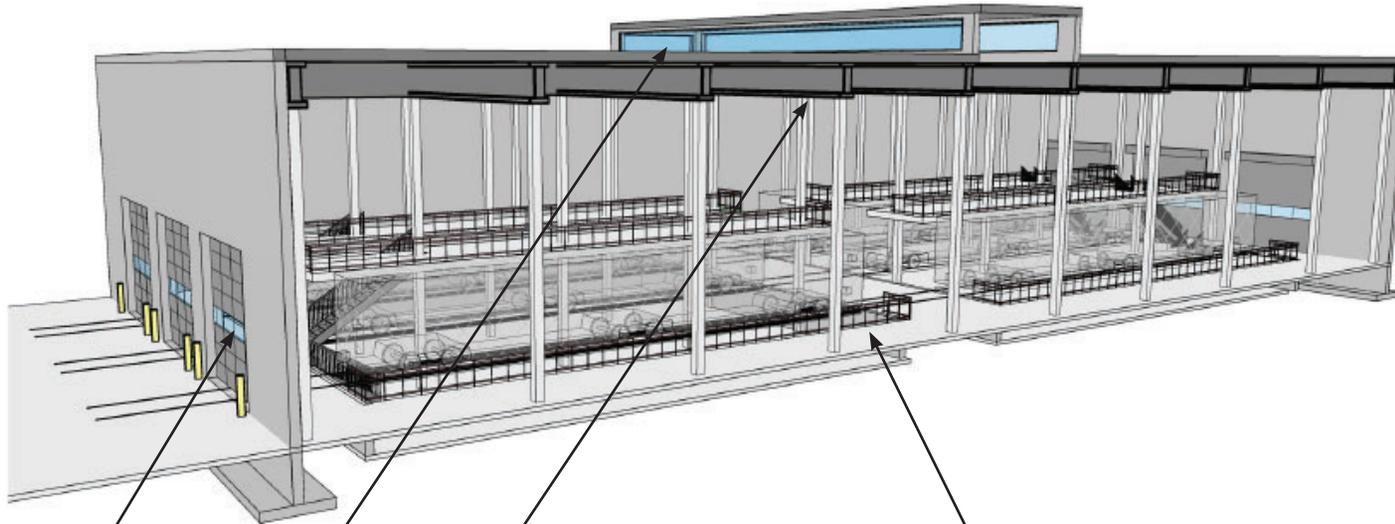

- Route water, sanitary, vent, storm, and service equipment piping above ground and above walk/forklift aisles

**5.10.3 Electrical Systems Coordination**

- Route main conduit runs above ground and above walk/forklift aisles.
- Communication systems and cable trays shall be coordinated with other building systems to allow for installation, removal of cables in the future. All communications conduits and cable trays shall be routed above ground.
- Route branch circuits, equipment feeds above ground to facilitate future renovations

SECTION 5 - REQUIREMENTS FOR BUS YARD COMPONENT SPACE MODULES

Sustainable Strategies

- Daylighting through skylights/clerestories/roof/monitors/windows in bay doors
- Low VOC finishes
- Operable windows/natural ventilation
- Use of recycled content of materials
- Destratification fans in high bay areas

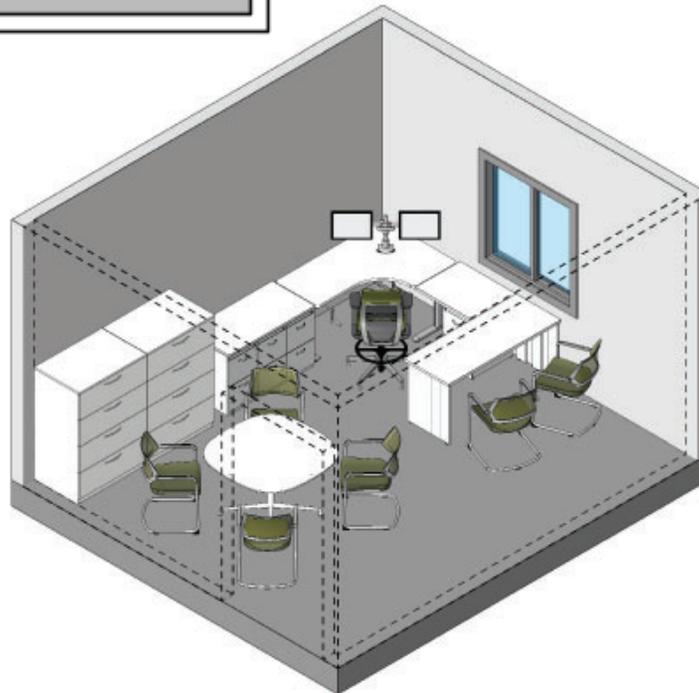

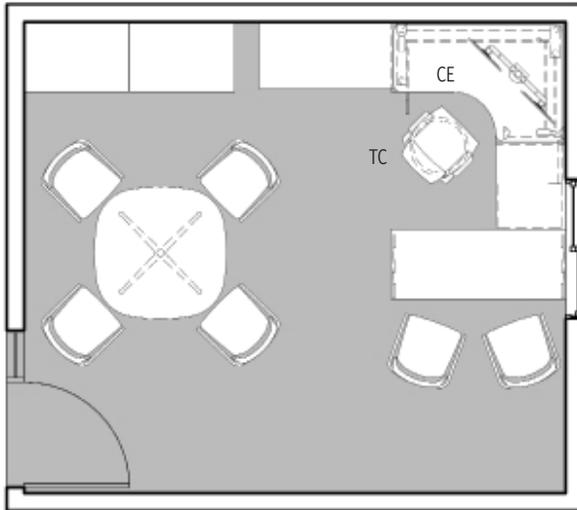

- Radiant floor slab heating
- Air quality sensors for exhaust fan controls
- Use of durable, long-lasting building materials
- Occupancy sensors
- Use of local building products
- Renewable energy sources such as solar and geothermal

## SECTION 5.1: OFFICE MODULES

**PRIVATE OFFICE - 224 SF**

**FUNCTION**

Private office for completing work tasks and holding small meetings.

**RELATIONSHIP TO OTHER AREAS**

- Case specific (office areas specific to each group); reference general modules

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

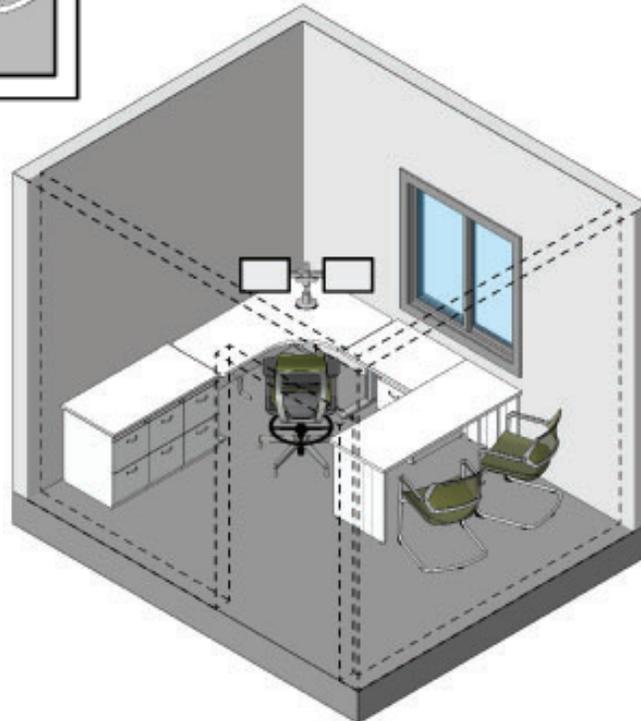

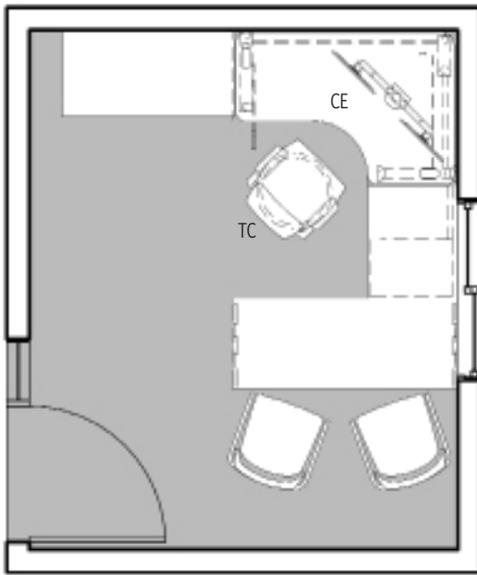

**EQUIPMENT/FURNISHINGS**

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files
- Table and Chairs

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile
  - ✓ Doors:
    - Single leaf 3'-0" door with sidelight and lockable lever set hardware
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ LED Lighting in accordance with IES recommendation (35 fc average)
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (as required)

**PRIVATE OFFICE - 120 SF**

**FUNCTION**

Private office for completing work tasks and holding one on one meetings.

**RELATIONSHIP TO OTHER AREAS**

- Case specific (office areas specific to each group); reference general modules

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

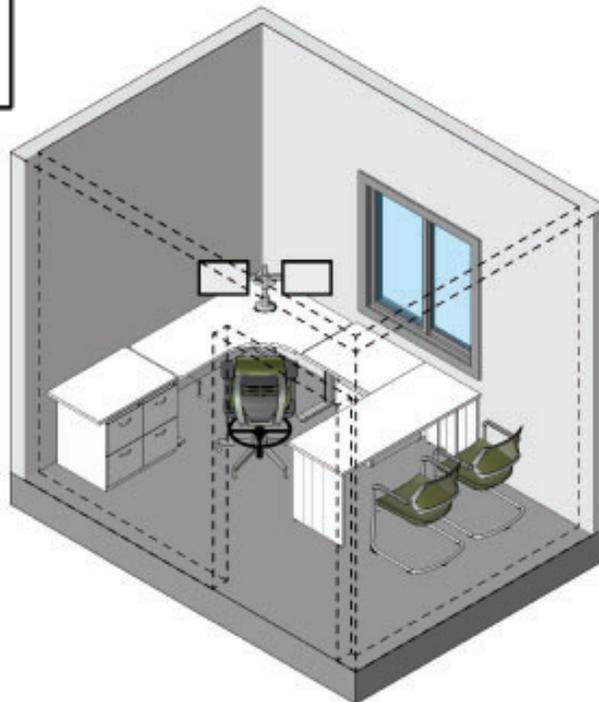

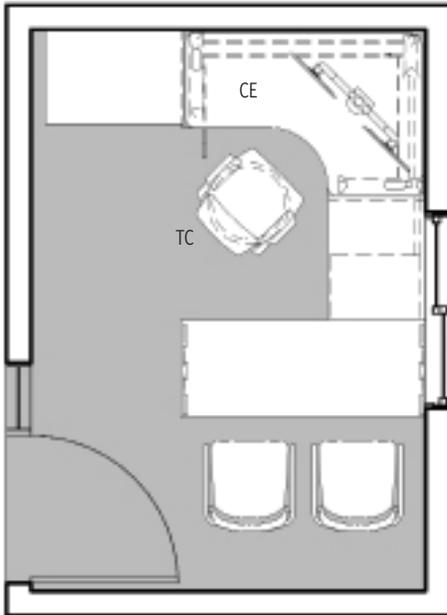

**EQUIPMENT/FURNISHINGS**

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files
- Guest chairs

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile
  - ✓ Doors:
    - Single leaf 3'-0" door with sidelight and lockable lever set hardware
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ LED Lighting in accordance with IES recommendation (35 fc average)
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (as required).

**PRIVATE OFFICE - 100 SF**

**FUNCTION**

Private office for completing work tasks and holding one on one meetings.

**RELATIONSHIP TO OTHER AREAS**

- Case specific (office areas specific to each group); reference general modules

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

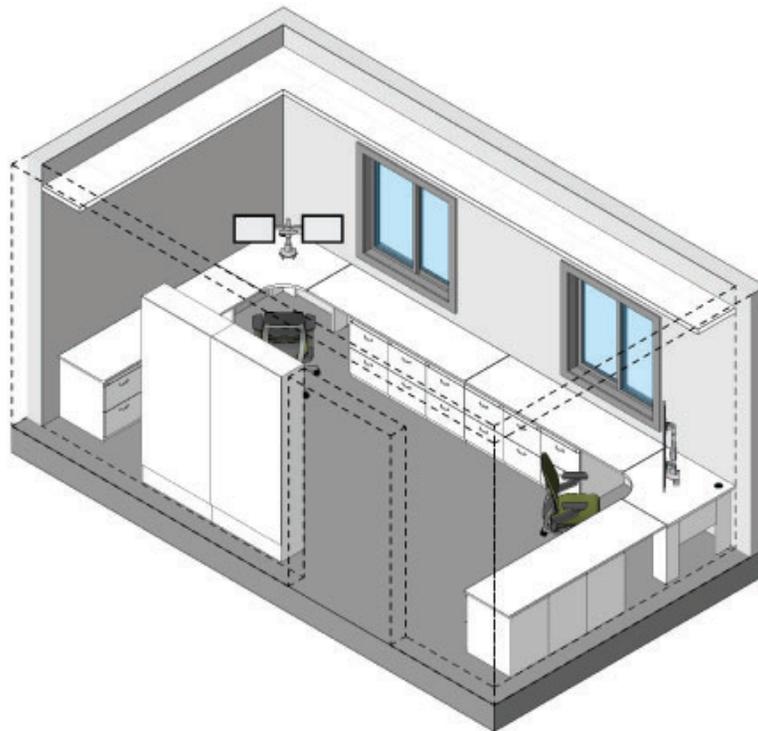

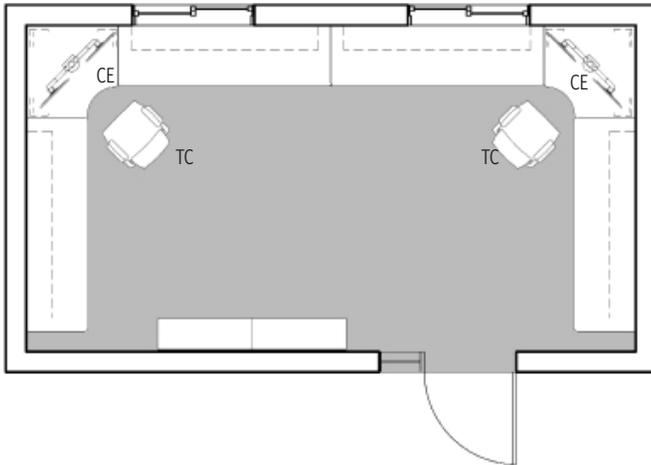

**EQUIPMENT/FURNISHINGS**

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files
- Guest chairs

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile
  - ✓ Doors:
    - Single leaf 3'-0" door with sidelight and lockable lever set hardware
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ LED Lighting in accordance with IES recommendation (35 fc average)
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (as required).

SHARED OFFICE

FUNCTION

Shared office for completing work tasks and holding one on one meetings.

RELATIONSHIP TO OTHER AREAS

- Case specific (office areas specific to each group); reference general modules

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

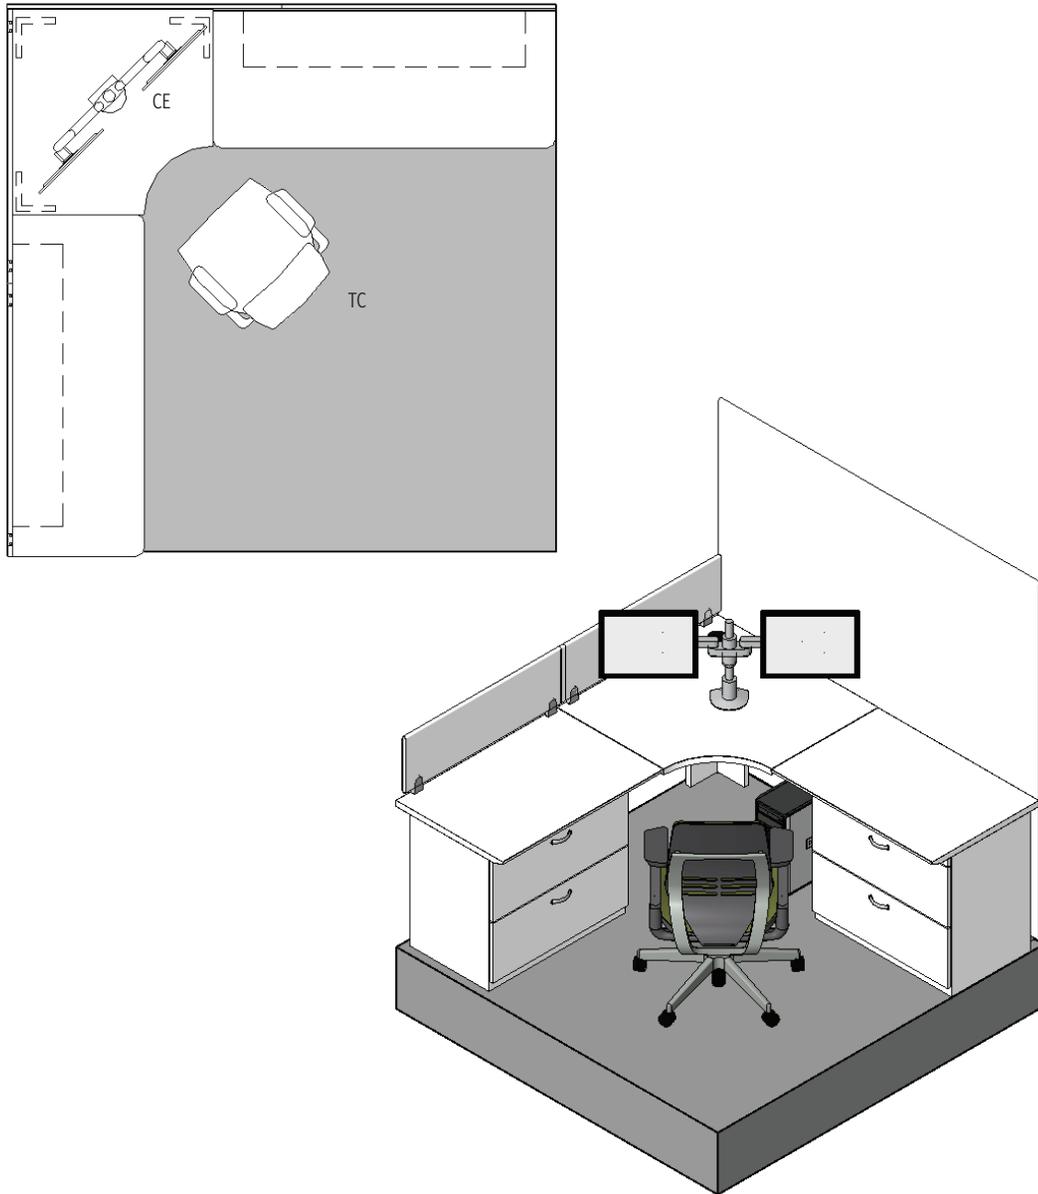

EQUIPMENT/FURNISHINGS

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files
- Guest chairs

DESIGN FEATURES

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile
  - ✓ Doors:
    - Single leaf 3'-0" door with sidelight and lockable lever set hardware
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ LED Lighting in accordance with IES recommendation (35 fc average)
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (as required).

**WORKSTATION - 64 SF**

**FUNCTION**

Open office workstation to complete work tasks.

**RELATIONSHIP TO OTHER AREAS**

- Case specific (office areas specific to each group); reference general modules

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

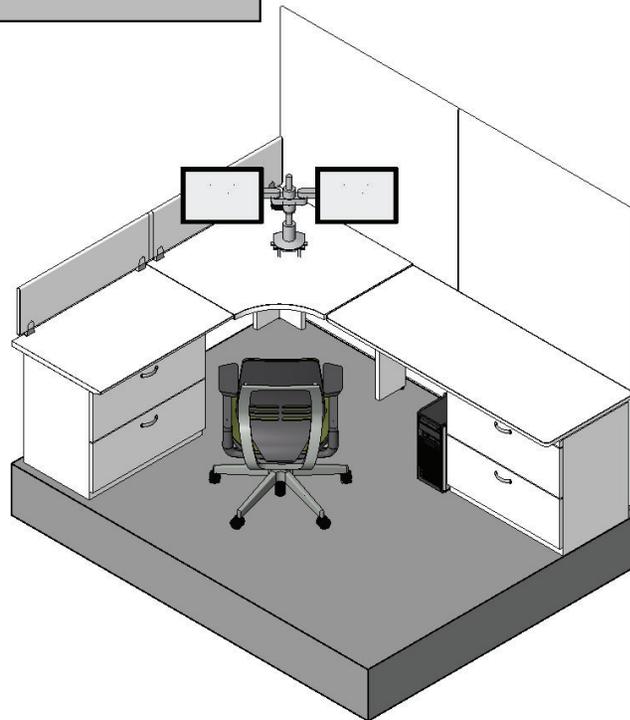

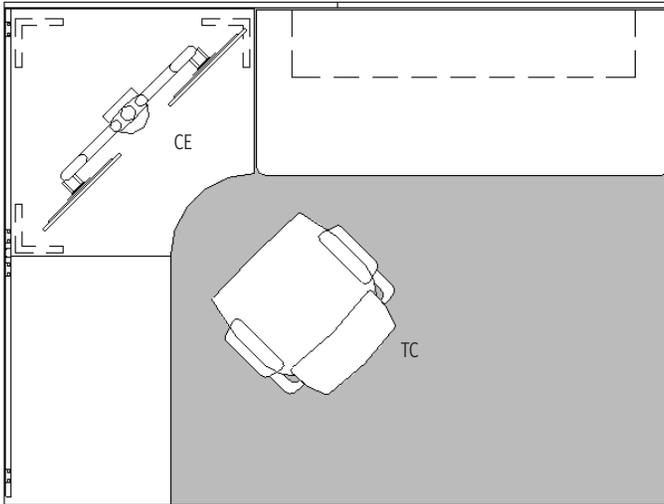

**EQUIPMENT/FURNISHINGS**

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Ceiling: Acoustical ceiling tile
- Daylighting: Access to natural light
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (three minimum) and a quad receptacle at workstation
  - ✓ Provide one data outlet with four data ports at workstation
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation (35 fc average)
  - ✓ Verify feasibility of providing individual control of selected luminaires
  - ✓ Task lighting (as required).

**WORKSTATION - 48 SF**

**FUNCTION**

Open office workstation to complete work tasks.

**RELATIONSHIP TO OTHER AREAS**

- Case specific (office areas specific to each group); reference general modules

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

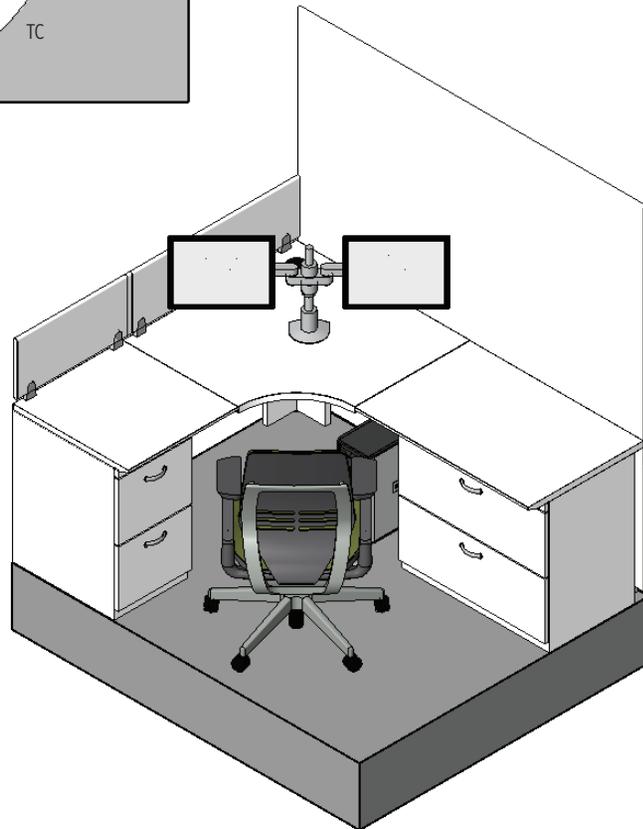

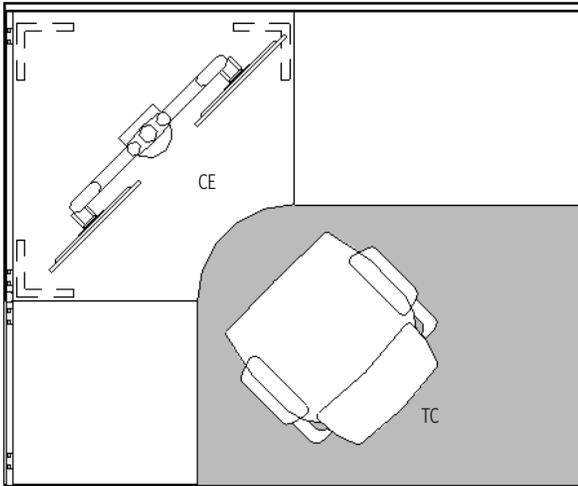

**EQUIPMENT/FURNISHINGS**

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Ceiling: Acoustical ceiling tile
- Daylighting: Access to natural light
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (three minimum) and a quad receptacle at workstation
  - ✓ Provide one data outlet with four data ports at workstation
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation (35 fc average)
  - ✓ Verify feasibility of providing individual control of selected luminaires
  - ✓ Task lighting (as required).

**WORKSTATION - 30 SF AND 36 SF**

**FUNCTION**

Open office workstation to complete work tasks.

**RELATIONSHIP TO OTHER AREAS**

- Case specific (office areas specific to each group); reference general modules

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

**EQUIPMENT/FURNISHINGS**

- Task chair
- TMC 60" by 30" typical sit/stand workstation
- Two pedestal cabinets per station. One two-drawers for files, and one three-drawers for personal items and files

**DESIGN FEATURES**

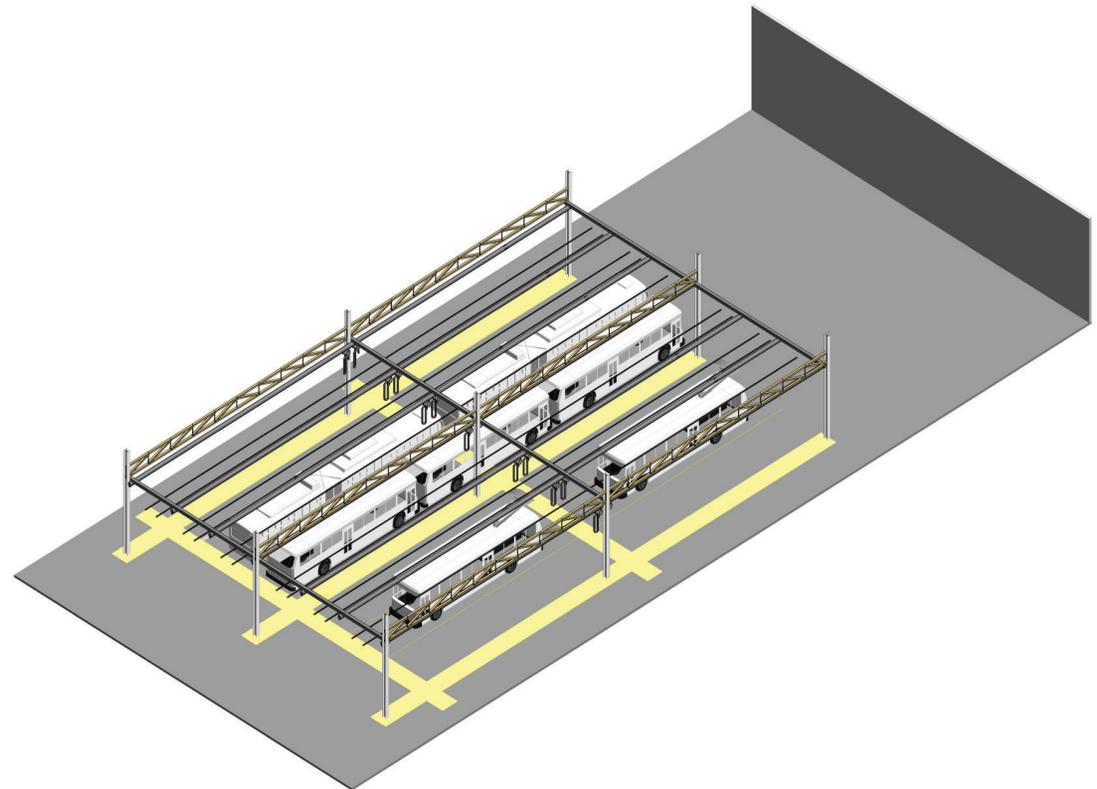

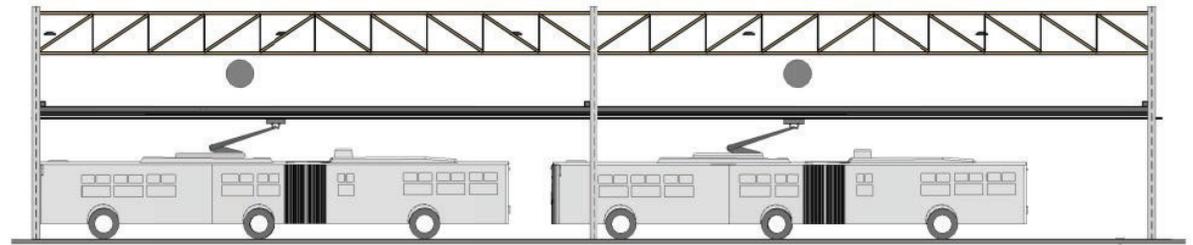

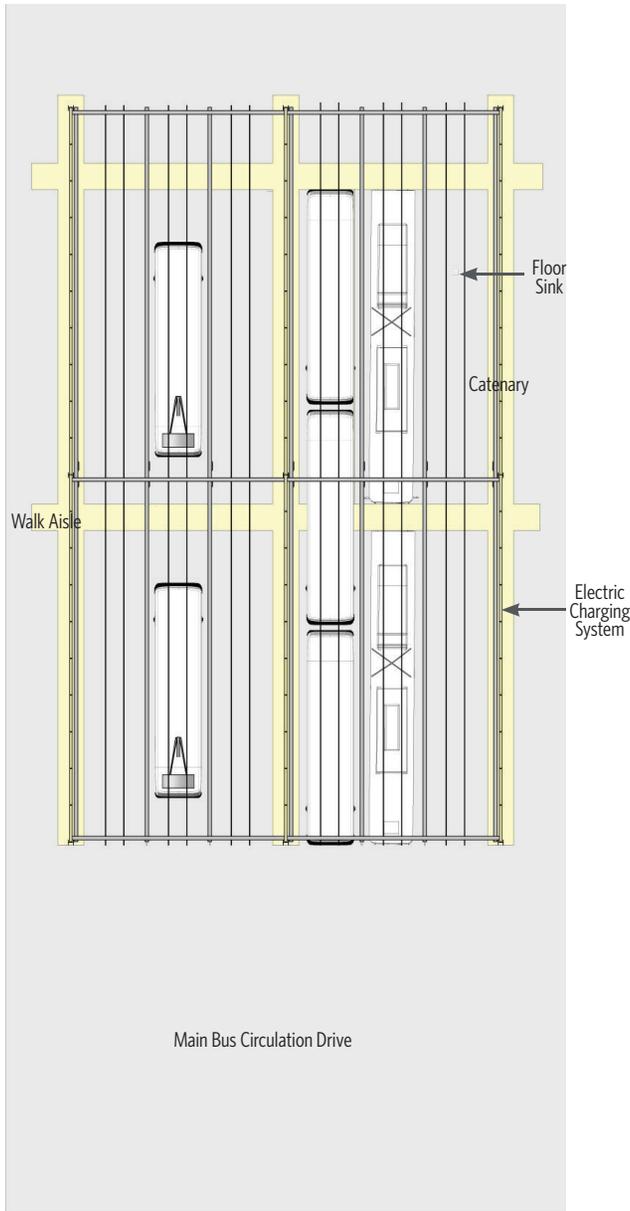

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for operation and administration areas. Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas
  - ✓ Ceiling: Acoustical ceiling tile
- Daylighting: Access to natural light
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ Provide general purpose duplex receptacles (three minimum) and a quad receptacle at workstation
  - ✓ Provide one data outlet with four data ports at workstation
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation (35 fc average)
  - ✓ Verify feasibility of providing individual control of selected luminaires.
  - ✓ Task lighting (as required).

## SECTION 5.2: PARKING

40' AND 60' BUS PARKING

40' AND 60' BUS PARKING		
<p style="text-align: center;"><b>FUNCTION</b></p> <p>Dedicated area to park 40' and 60' trolleys.</p>	<ul style="list-style-type: none"> <li>✓ Have the buses go on wire at different locations on the street depending on their route. One block after pullout, another 5 blocks after pullout, and so on.</li> </ul>	<p style="text-align: center;"><b>PLUMBING CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Trench drain at overhead door with flush, removable grate covers, with sediment basket upstream of trap, to central sediment and oil interceptor.</li> <li>• 3/4" water hose bibb with standard faucet at rear of bay 2'-0" AFF (one per three bays)</li> <li>• Compressed air:                         <ul style="list-style-type: none"> <li>✓ 2'-0" compressed air piping loop (minimum)</li> <li>✓ Compressed air drops with shut-off valve, union separator, regulator with gauge and quick disconnects on 4'-0" AFF (one per four parking stalls)</li> <li>✓ Provide 3/8" and 1/2" disconnects at locations to be determined during detailed design</li> <li>✓ As required by equipment</li> </ul> </li> <li>• Additional plumbing connections (water, drainage, etc.) as required by equipment</li> </ul>
<p style="text-align: center;"><b>RELATIONSHIP TO OTHER AREAS</b></p> <ul style="list-style-type: none"> <li>• Access to Service Positions</li> <li>• Access to Bus Washer</li> </ul>	<p style="text-align: center;"><b>ARCHITECTURAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Finishes:                         <ul style="list-style-type: none"> <li>✓ Floor: Soil, grease, water, slip resistant concrete with chemical bonded concrete sealer</li> <li>✓ Walls: Soil and grease resistant, with light colored finish, concrete or masonry</li> <li>✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish</li> </ul> </li> <li>• Doors:                         <ul style="list-style-type: none"> <li>✓ Personnel door with view panel to meet applicable code exit requirements</li> <li>✓ Exterior of building overhead doors: High-lifting sectional, steel, insulated, size per Fleet 16'-0" wide by 16'-0" with view panels, automatic operator, detection loops</li> <li>✓ Bollards on exterior at jambs of overhead door (two each)</li> </ul> </li> </ul>	<p style="text-align: center;"><b>ELECTRICAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Power:                         <ul style="list-style-type: none"> <li>✓ All receptacles and outlets at 3'-6" AFF</li> <li>✓ Provide general purpose duplex receptacles on every column</li> <li>✓ As required by equipment</li> </ul> </li> <li>• Lighting:                         <ul style="list-style-type: none"> <li>✓ LED lighting in accordance with IES recommendation (5 fc average)</li> <li>✓ Fixtures located to illuminate work spaces and around the vehicles</li> <li>✓ Luminaires shall be placed between every row of buses to allow illumination between buses</li> </ul> </li> <li>• Communications: Paging/intercom system speakers with 100 percent coverage of all parking stalls</li> </ul>
<p style="text-align: center;"><b>CRITICAL DIMENSIONS</b></p> <ul style="list-style-type: none"> <li>• 19'-0" preferred vertical clearance to structure and fixtures. This vertical clearance height may be reduced to a minimum of 17' only if all fixtures, building systems, OCS, ETB pole systems, structure, and all other Technical Requirements are fully accommodated.</li> <li>• 12'-0" wide x 65'-0" long per space (60' bus)</li> <li>• 12'-0" wide x 45'-0" long per space (40' bus)</li> <li>• Ramps:                         <ul style="list-style-type: none"> <li>✓ 15'-0" wide ramp (minimum)</li> <li>✓ 14'-0" vertical clearance to structure and fixtures</li> <li>✓ Maximum 10 percent slope with 40' long 5 percent transition ramps at top and bottom</li> </ul> </li> </ul>	<p style="text-align: center;"><b>STRUCTURAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Control joints in floor slab at adequate spacing</li> <li>• Structure as needed to support equipment</li> </ul>	
<p style="text-align: center;"><b>EQUIPMENT/FURNISHINGS</b></p> <ul style="list-style-type: none"> <li>• OCS: Wire in parking positions for trolley buses</li> <li>• Electric charging: Reference E-Bus Performance Requirements. This E-Bus Performance Requirements Document supersedes anything in this document.</li> </ul>	<p style="text-align: center;"><b>MECHANICAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Ventilation:                         <ul style="list-style-type: none"> <li>✓ 1.5 CFM exhaust per square foot of floor area</li> <li>✓ Return air openings in areas used for repair or servicing vehicles shall not be less than 18" above floor level accordance with NFPA 30A and ASHRAE 62.1</li> </ul> </li> <li>• Heating set point: 65 degrees Fahrenheit</li> </ul>	
<p style="text-align: center;"><b>DESIGN FEATURES</b></p> <ul style="list-style-type: none"> <li>• Buses parking in each aisle of every bus parking level must be organized by buses of the same length. Further, each bus parking aisle shall be designated for its respective bus length so that the charging infrastructure can be efficiently accommodated.</li> <li>• Pulling out from the facility needs to be further evaluated in final design because of the affects of going on wire could have on backups or delays at pullout. A couple of options are:                         <ul style="list-style-type: none"> <li>✓ Having wires connected to the street wires from inside the building so that going on wire would happen in a parking que lane at the exit of the facility.</li> </ul> </li> </ul>		

### GENERAL NOTES

- Provide one Preventive Maintenance Bay for every 50 buses
- All Maintenance Bays are designed for 40' and 60' buses
- The above are all industry standards. Reference Appendix C: Equipment Manual for industrial shop equipment specified per space.

## SECTION 5.3: BAYS AND SHOPS

GENERAL OFFICE MODULES: OFFICE AREAS

**RUNNING REPAIR - SUPERVISOR**

- Reference **Office Module Workstation - 64 sf**
- View of Repair Bays and Shops
- Adjacent to Preventive Maintenance Supervisor

**CONTROL ROOM CLERK**

- Reference **Office Module Workstation - 64 sf**

<p><b>DESIGN FEATURES</b></p> <ul style="list-style-type: none"> <li>• Forklift access</li> <li>• Natural daylighting desired</li> <li>• Roof Level Work Platform (RLWP) with fall protection</li> </ul>		

60' BUS PREVENTIVE MAINTENANCE

**60' BUS PREVENTIVE MAINTENANCE**

**FUNCTION**

Bay space to perform preventive maintenance such as inspections, and underfloor component replacement or repair on trolleys, and future battery electric buses with a Lower Level Work Area (LLWA). As well as, roof top component repair or replacement with an Upper Level Work Platform (ULWP) are performed in this area as well.

**RELATIONSHIP TO OTHER AREAS**

- Access to Common Work Area, Parts Storage, Portable Equipment Storage Areas, and Maintenance Office areas

**CRITICAL DIMENSIONS**

- 19'-0" vertical clearance to structure and fixtures
- 20'-0" wide by 75'-0" long
- LLWA: 60'-0" long by 10'-0" wide by 8'-6" depth (min.)
- 25'-0" (min) vertical clearance within the bay where bus is in position.

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment
- Electric charging: Reference E-Bus Performance Requirements. This E-Bus Performance Requirements Document supersedes anything in this document.
- Lockout/tag out system required when bus is in position
- No OCS: Wire in position for trolley buses.

**DESIGN FEATURES**

- Forklift access
- Natural daylighting desired
- LLWA
- ULWP
- Tire guides are required to assist with the maneuvering into the bay
- Lockout/tag out system for access to ULWP
- Trolley pole system inspection and maintenance to be conducted in all PM Bays. Reference diagram in section 3.6 OCS-Trolley for height diagram.

- Multiple PM bays should be located adjacent to one another and the LLWA for each should be contiguous from one to another, to allow for uninhibited passage from one LLWA to the next LLWA across the entire length of the LLWA.

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access
- LLWA opening to support bridge jacks

**MECHANICAL CONSIDERATIONS**

- As required by equipment
- Ventilation:
  - ✓ 1.5 CFM exhaust per square foot exhaust
  - ✓ Return openings in areas used for repair or servicing vehicles shall not be less than 18" above floor level accordance with NFPA 30A and ASHRAE 62.1
- Heating set point: 65 degrees Fahrenheit
- In-floor radiant heat (if desired)
- LLWA:
  - ✓ Minimum 1 CFM per square foot of LLWA floor area at all times the building is occupied or when vehicles are parked over these areas.
  - ✓ Exhaust shall be taken from a point within 1'-0" of the floor

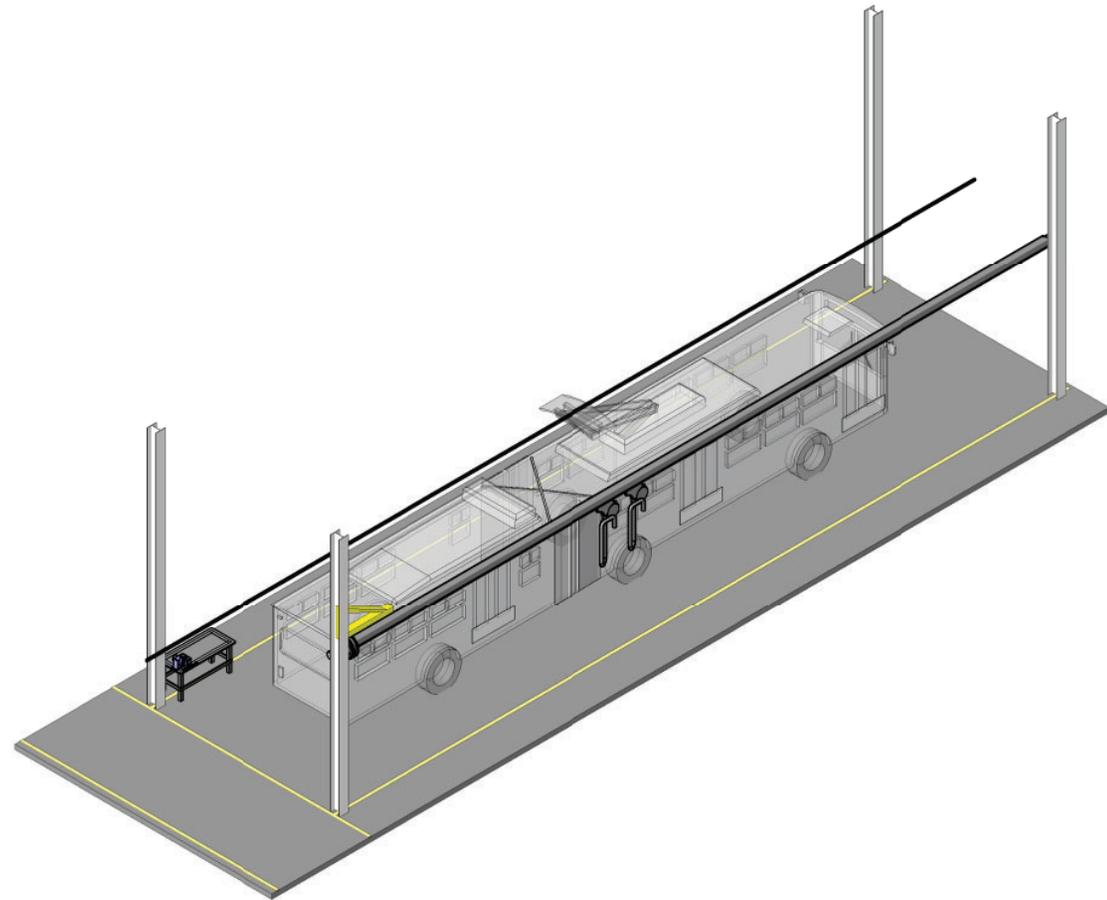

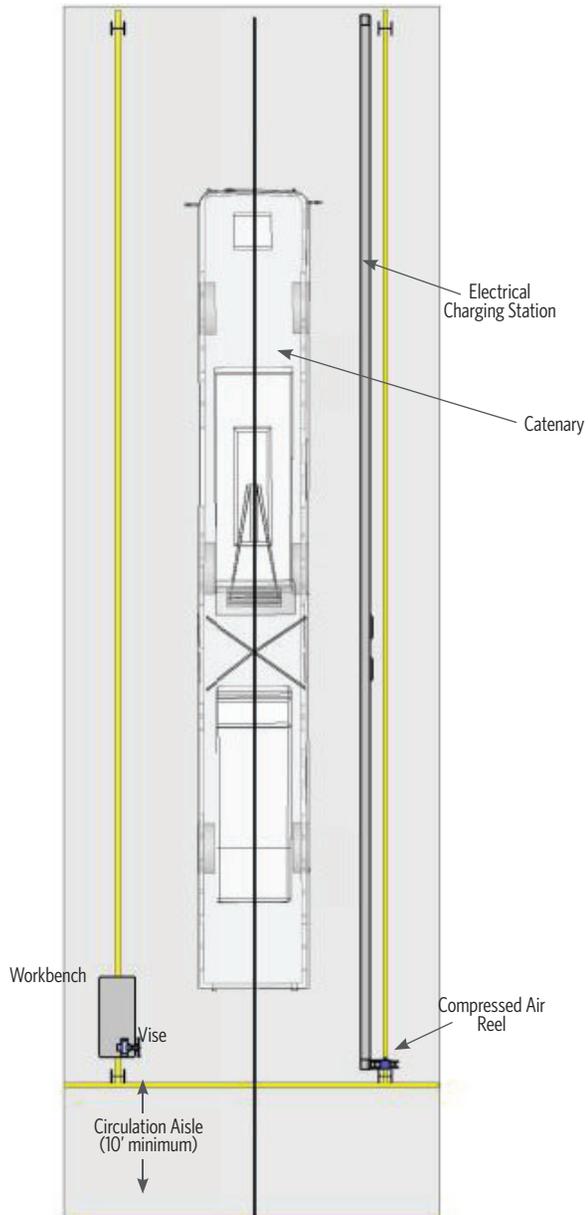

**PLUMBING CONSIDERATIONS**

- 3/4" water hose bibb with standard faucet at rear of bay on main and LLWA level, 2'-0" AFF (one per bay)
- Compressed air:
  - ✓ 2'-0" compressed air piping loop (minimum)
  - ✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ Provide on Main Level, ULWP, and LLWA
  - ✓ As required by equipment
- Additional plumbing connections (water, drainage, etc.) as required by equipment

**ELECTRICAL CONSIDERATIONS**

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (four minimum) on walls, columns, and between overhead doors
  - ✓ Dedicated computer receptacle, adjacent to data conduit on column adjacent to workbench
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (75 fc average)
  - ✓ Explosion proof LED lighting in pit
  - ✓ Fixtures located to illuminate work spaces and around the vehicles
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns at each bay

60' BUS TIRE BAY

**60' BUS TIRE BAY**

**FUNCTION**

Bay space to perform tire replacement and repair on trolleys and future BEBs.

**RELATIONSHIP TO OTHER AREAS**

- Access to Common Work Area, Parts Storage, Portable Equipment Storage Areas, and Maintenance Office areas
- Adjacent to Tire Shop

**CRITICAL DIMENSIONS**

- 19'-0" vertical clearance to structure and fixtures
- 20'-0" wide by 75'-0" long

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment
- Electric charging: Reference E-Bus Performance Requirements. This E-Bus Performance Requirements Document supersedes anything in this document.
- OCS: Wire in positions for trolley buses

**DESIGN FEATURES**

- Forklift access
- Natural daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- As required by equipment
- Ventilation:
  - ✓ 1.5 CFM exhaust per square foot of floor area
  - ✓ Return air openings in areas used for repair or servicing vehicles shall not be less than 18" above floor level accordance with NFPA 30A and ASHRAE 62.1
- Heating set point: 65 degrees Fahrenheit
- In-floor radiant heat (if desired)

**PLUMBING CONSIDERATIONS**

- Lubrication reel bank (shared one per two bays)
- 3/4" water hose bibb with standard faucet at rear of bay 2'-0" AFF (one per three bays)
- Compressed air:
  - ✓ 2'-0" compressed air piping loop (minimum)
  - ✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- Additional plumbing connections (water, drainage, etc.) as required by equipment

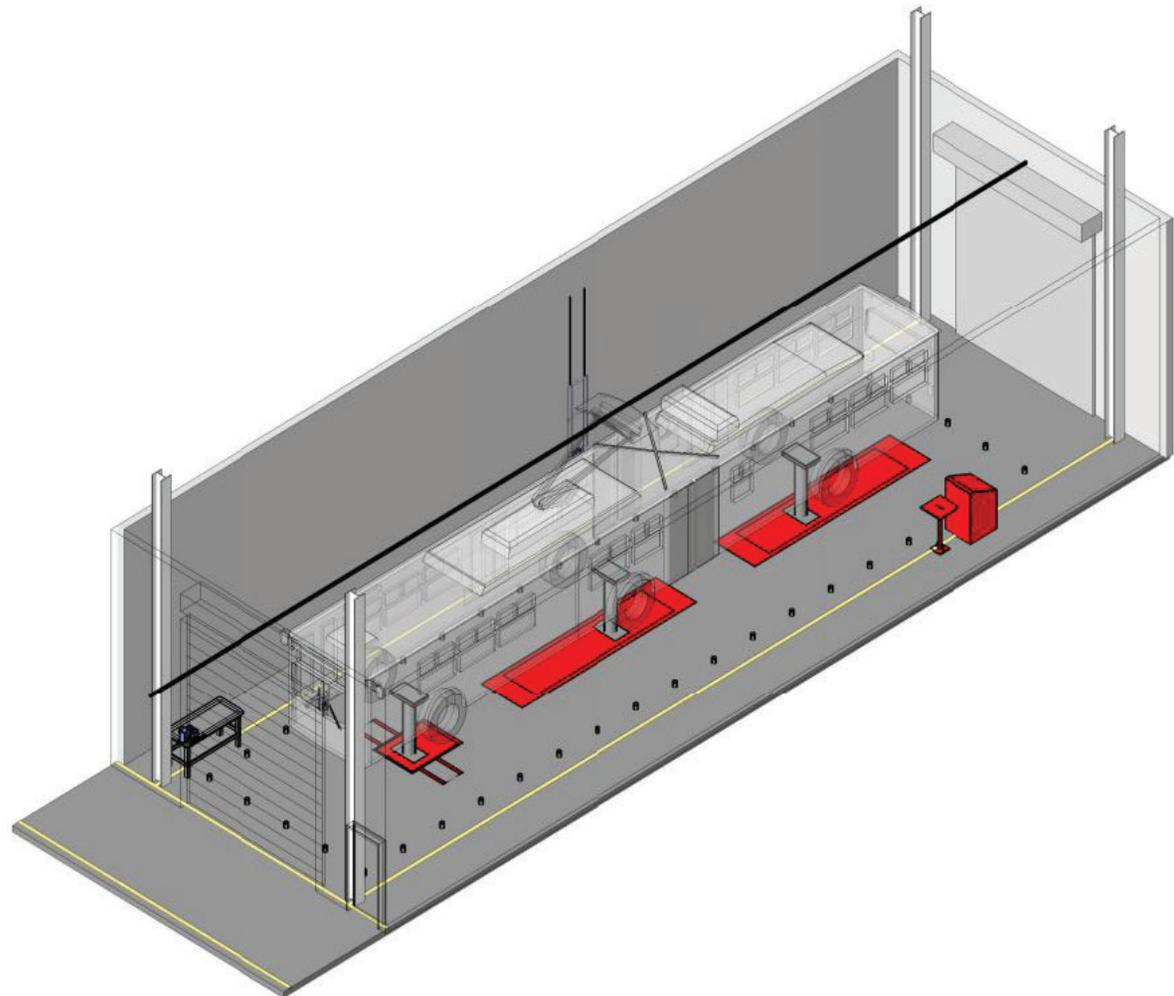

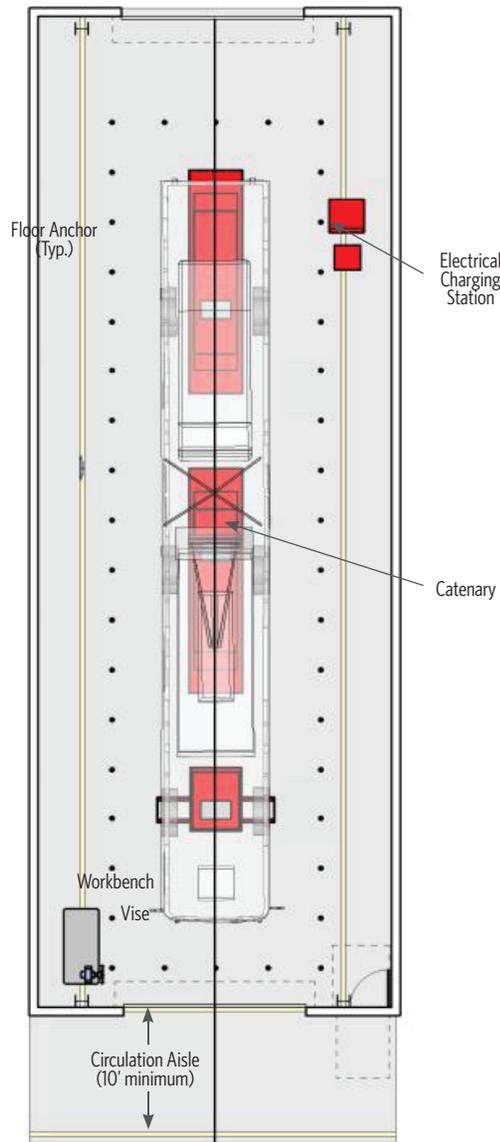

**ELECTRICAL CONSIDERATIONS**

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (four minimum) on walls, columns, and between overhead doors
  - ✓ Dedicated computer receptacle, adjacent to data conduit on column adjacent to workbench
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (25 fc average)
  - ✓ Fixtures located to illuminate work spaces and around the vehicles
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns at each bay

**FIRE SUPPRESSION CONSIDERATIONS**

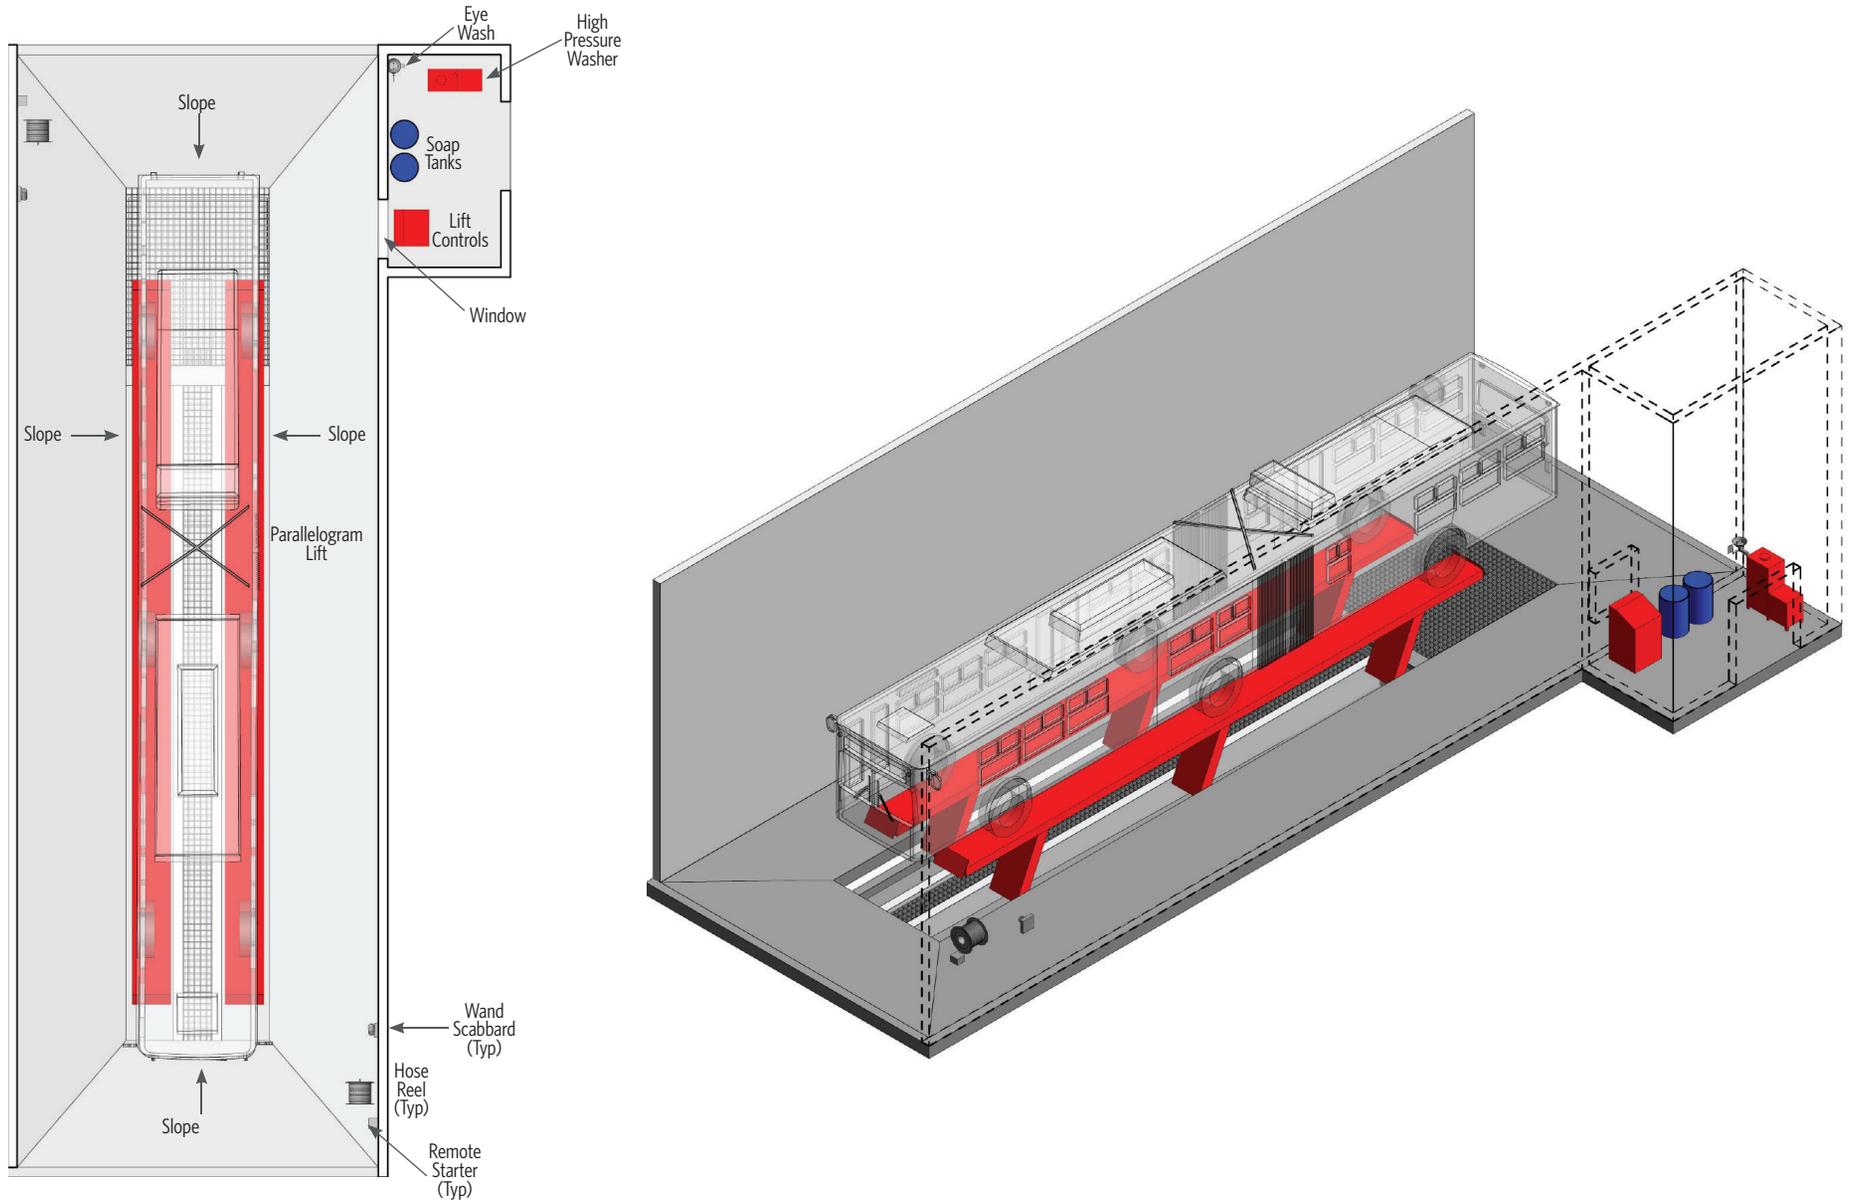

The fire protection and pyrotechnics experts on the detailed design team will be responsible for devising a robust fire protection system for the tire bay and tire shop/storage areas that minimizes risk to the Yard and any joint development above. Review and recommendations provided by the experts will include, but not be limited to, the location, ventilation, and fire suppression systems for Potrero Yard's tire facilities.

60' BUS MINOR BODY REPAIR

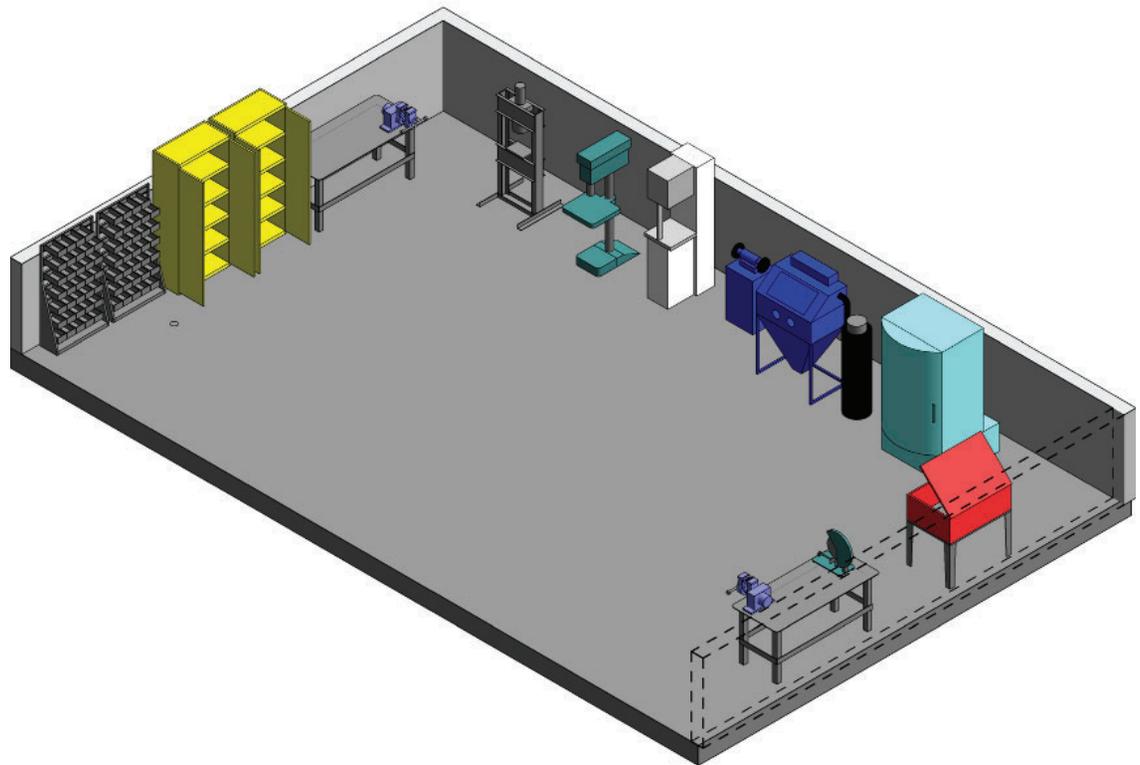

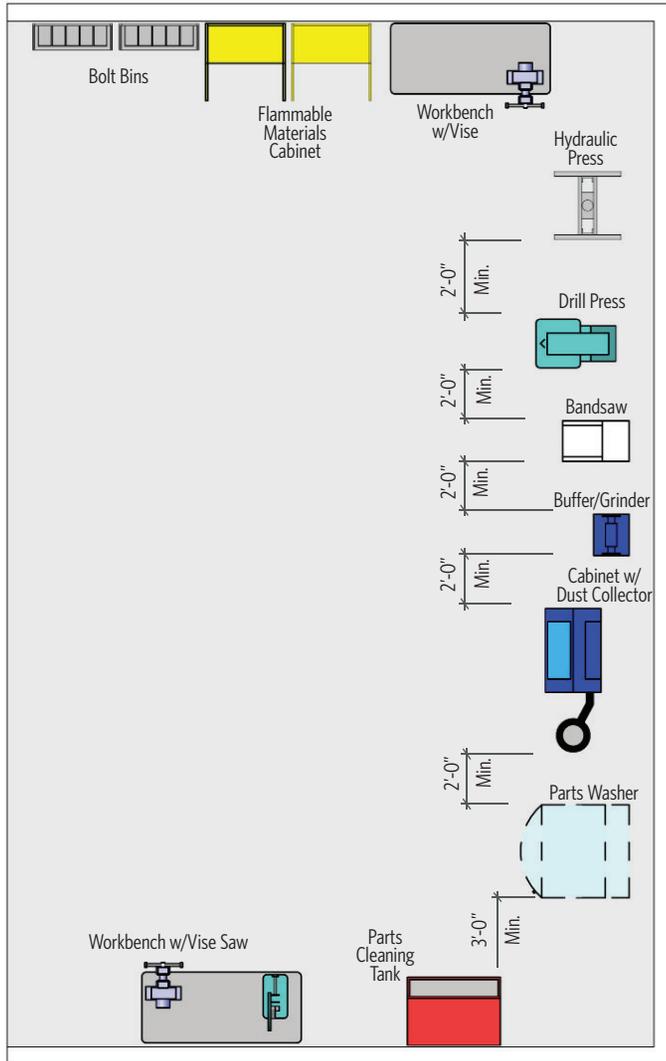

60' BUS MINOR BODY REPAIR		
<p><b>FUNCTION</b></p> <p>Perform minor replacement and repair of glass panel and other body parts of the trolley and future BEBs.</p>	<p><b>ARCHITECTURAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Finishes:                             <ul style="list-style-type: none"> <li>✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer</li> <li>✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry</li> <li>✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish</li> </ul> </li> <li>• Doors:                             <ul style="list-style-type: none"> <li>✓ Personnel door with view panel to meet applicable code exit requirements</li> <li>✓ Overhead door: High-lifting sectional, steel, insulated, 14'-0" by 14'-0" with view panels, automatic operator, interior and exterior push button controls</li> </ul> </li> </ul>	<p><b>PLUMBING CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Lubrication reel bank (shared one per two bays)</li> <li>• 3/4" water hose bibb with standard faucet at rear of bay 2'-0" AFF (one per three bays)</li> <li>• Compressed air:                             <ul style="list-style-type: none"> <li>✓ 2'-0" compressed air piping loop (minimum)</li> <li>✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF</li> <li>✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design</li> <li>✓ As required by equipment</li> </ul> </li> <li>• Additional plumbing connections (water, drainage, etc.) as required by equipment.</li> </ul>

<p><b>EQUIPMENT/FURNISHINGS</b></p> <ul style="list-style-type: none"> <li>• Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment</li> </ul>		
<p><b>DESIGN FEATURES</b></p> <ul style="list-style-type: none"> <li>• Half-height 56" walls on three sides for utilities and to prevent blocking vision of shop from office areas and repair bays</li> <li>• Forklift access</li> <li>• Natural daylighting desired</li> </ul>		

**PORTABLE EQUIPMENT STORAGE**

**FUNCTION**

A dedicated area for storage of portable shop equipment.

**RELATIONSHIP TO OTHER AREAS**

- Access to all Repair Bays and all shop areas

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

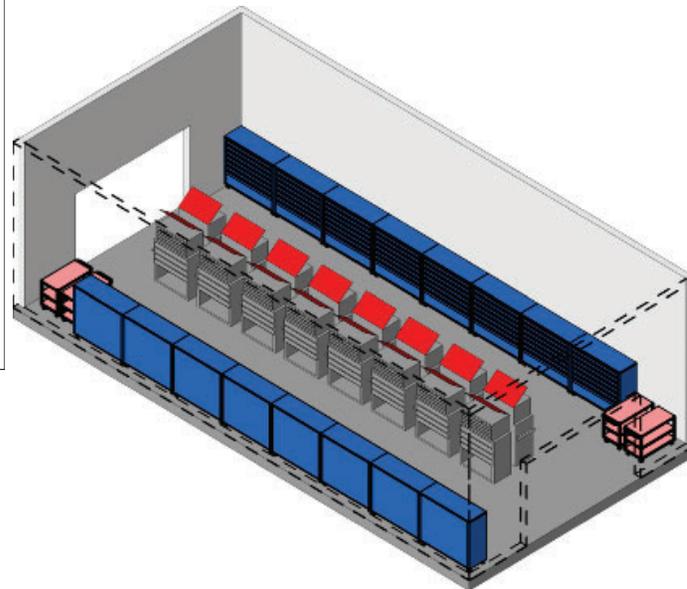

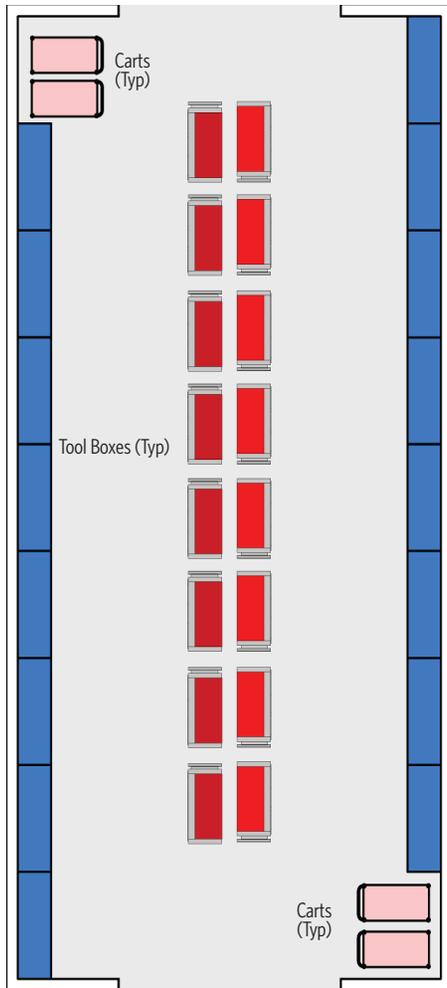

**EQUIPMENT/FURNISHINGS**

- Portable equipment including but not limited to: Service jacks, bottle jacks, jack stands, ladders, diagnostic equipment, used fluid drain pans, battery chargers, work platforms, welders, welding screens, etc.
- Typical equipment is shown, reference Appendix C: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finish concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (20 fc average)
  - ✓ Fixtures located to illuminate work spaces

**TOOL BOX STORAGE**

**FUNCTION**

Dedicated area for the storage of toolboxes and carts.

**RELATIONSHIP TO OTHER AREAS**

- Access to all repair bays and all shop areas

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

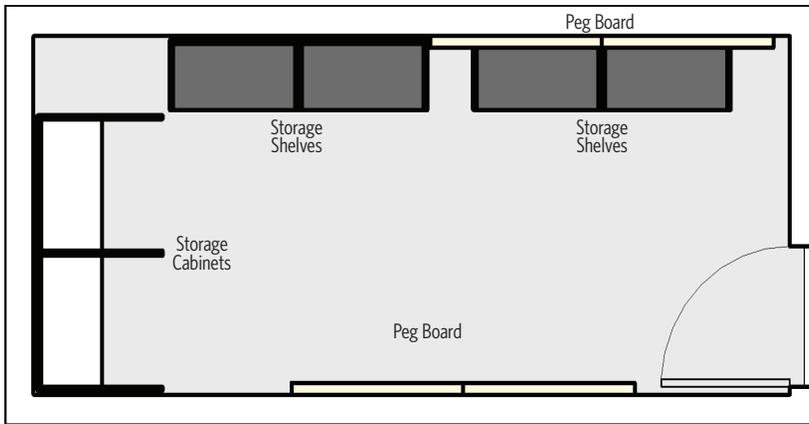

**EQUIPMENT/FURNISHINGS**

- Toolboxes
- Carts
- Anchors to be installed for security toolboxes
- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

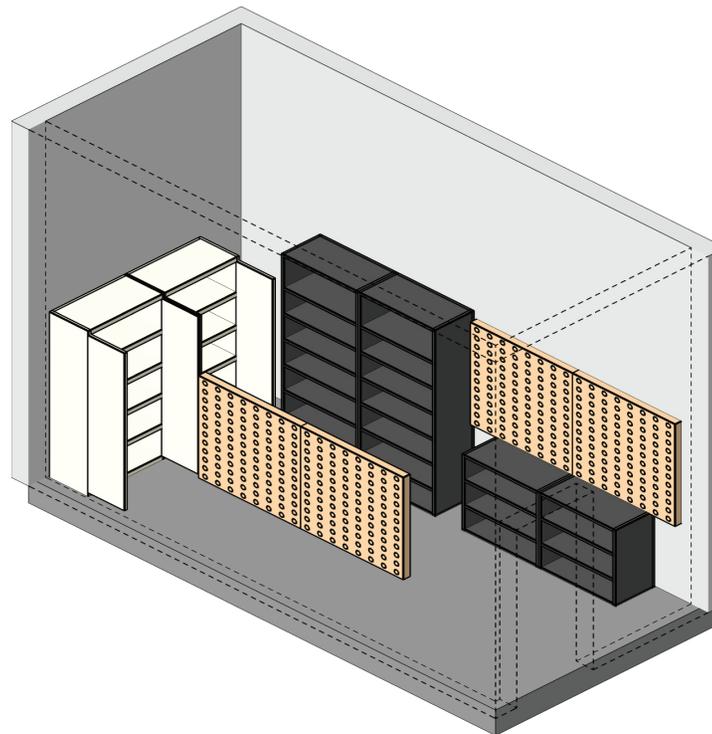

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (20 fc average)
  - ✓ Fixtures located to illuminate work spaces

**TOOL STORAGE**

**GENERIC WALL**

**FUNCTION**

Secure area for storing specialized tools and equipment.

**RELATIONSHIP TO OTHER AREAS**

- Access to Repair Bays and Shops
- Adjacent to Parts Room and Maintenance Offices

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

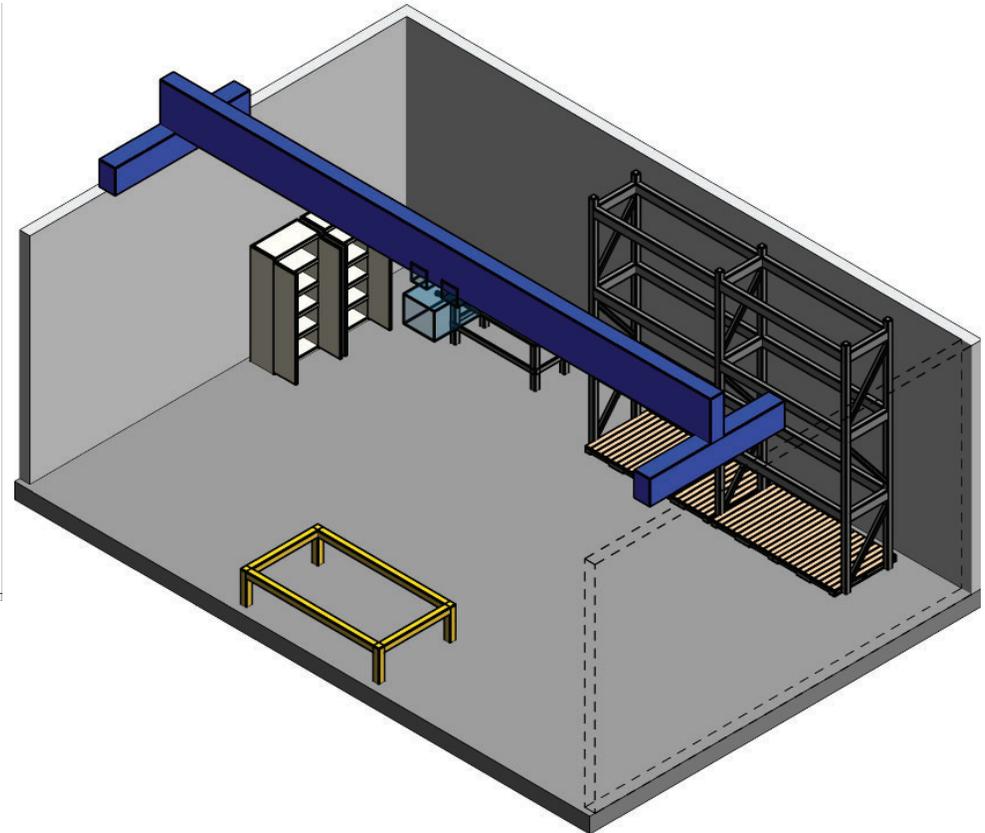

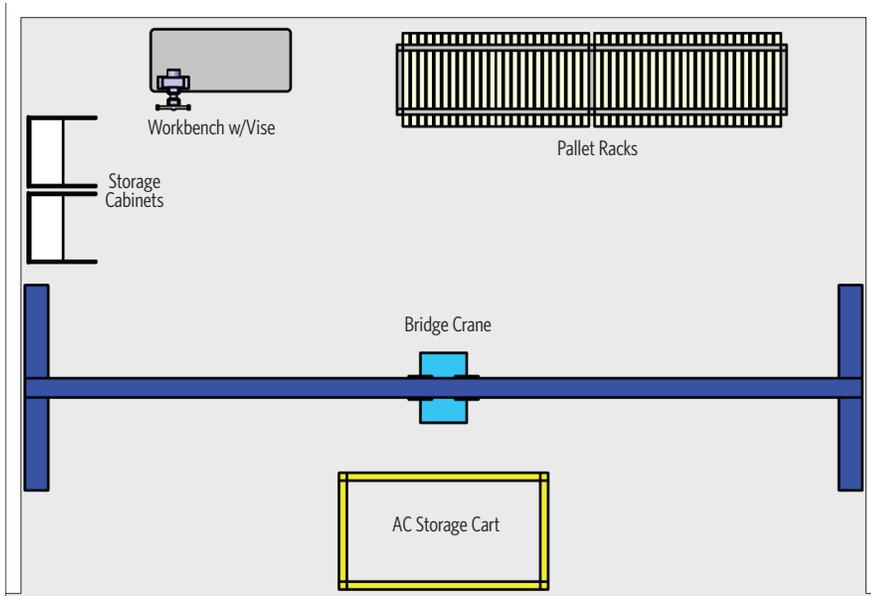

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

AC SHOP/STORAGE

**AC SHOP/STORAGE**

**FUNCTION**

Designated shop for repair and storage of air conditioning units for trolley and future BEBs.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to 60' Bus Preventive Maintenance

**CRITICAL DIMENSIONS**

- 19'-0" vertical clearance to structure and fixtures

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Forklift access
- Physically separated from other areas to prevent migration of noise, dirt and fumes, if possible
- Natural daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- In-floor radiant heat (if desired)
- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- As required by equipment

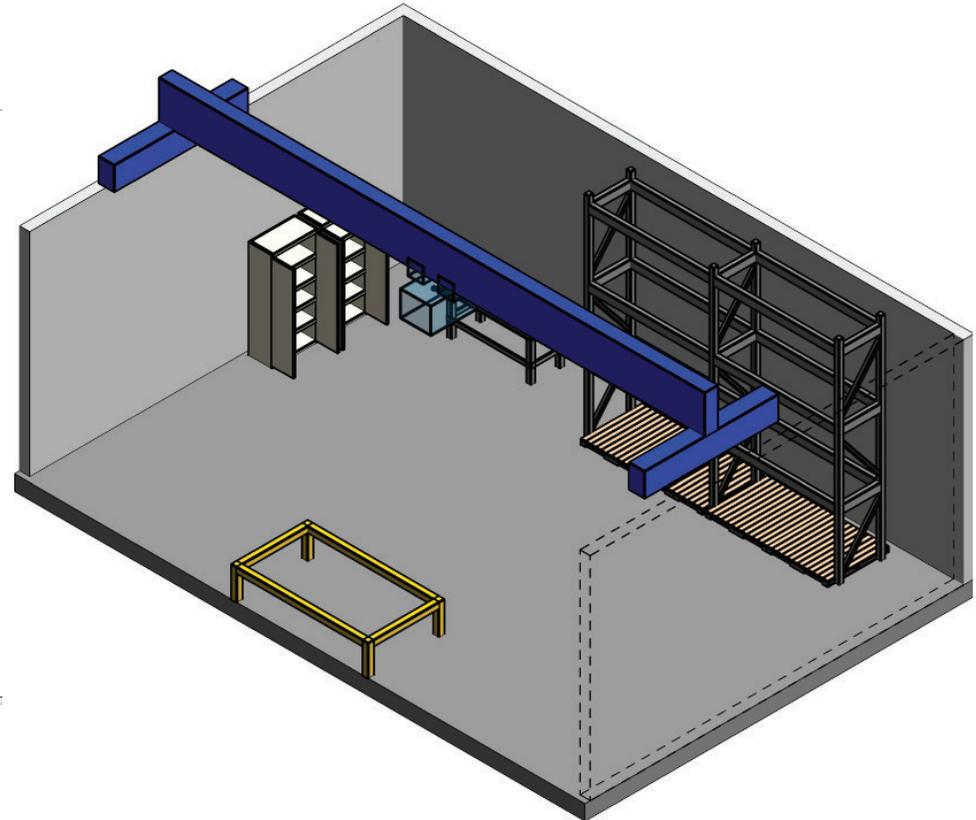

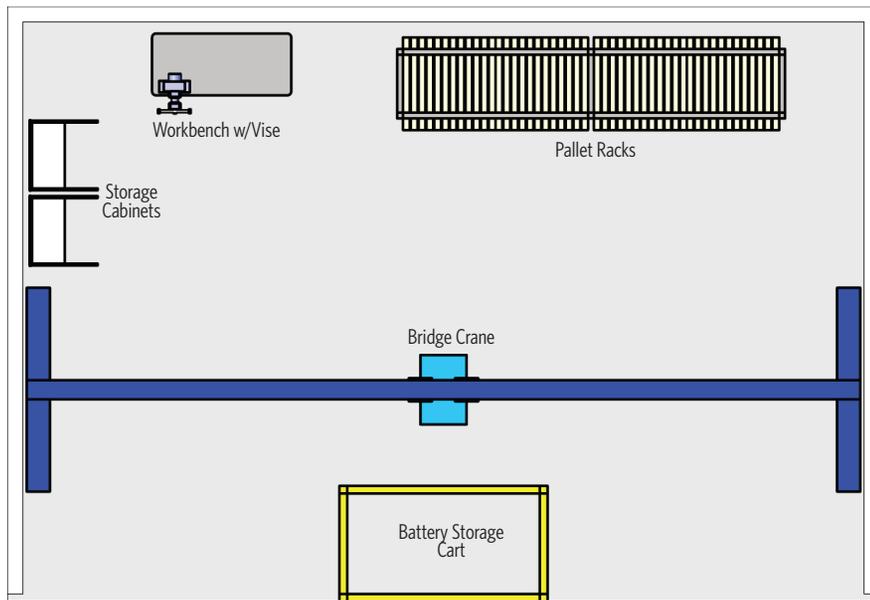

**PLUMBING CONSIDERATIONS**

- Compressed air drop:
  - ✓ 2'-0" compressed air piping loop (minimum)
  - ✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- Water: 3/4" water hose bibb with standard hose bibb at 2'-0" AFF
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

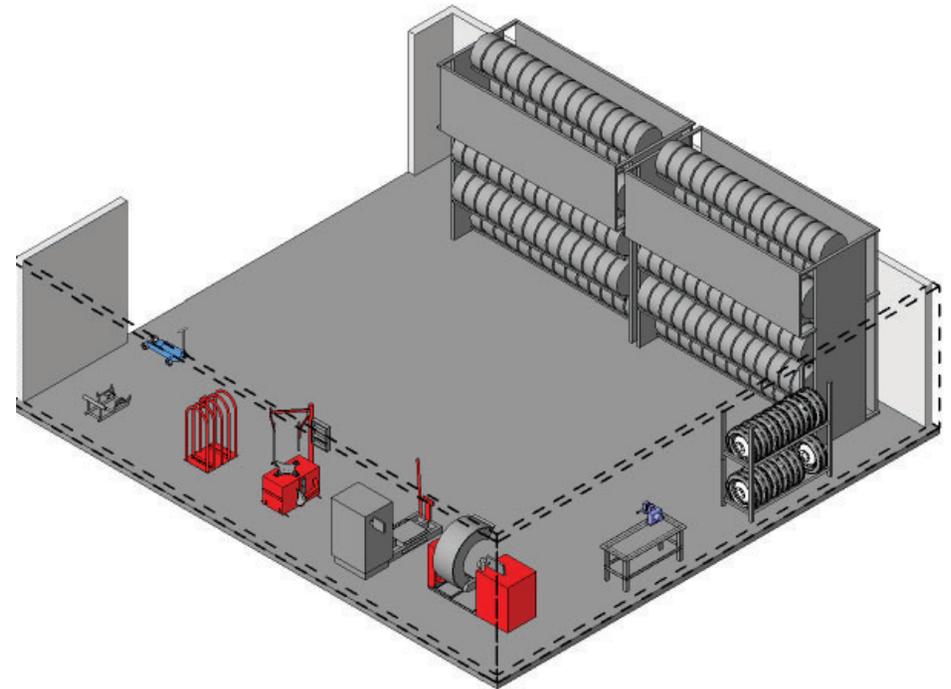

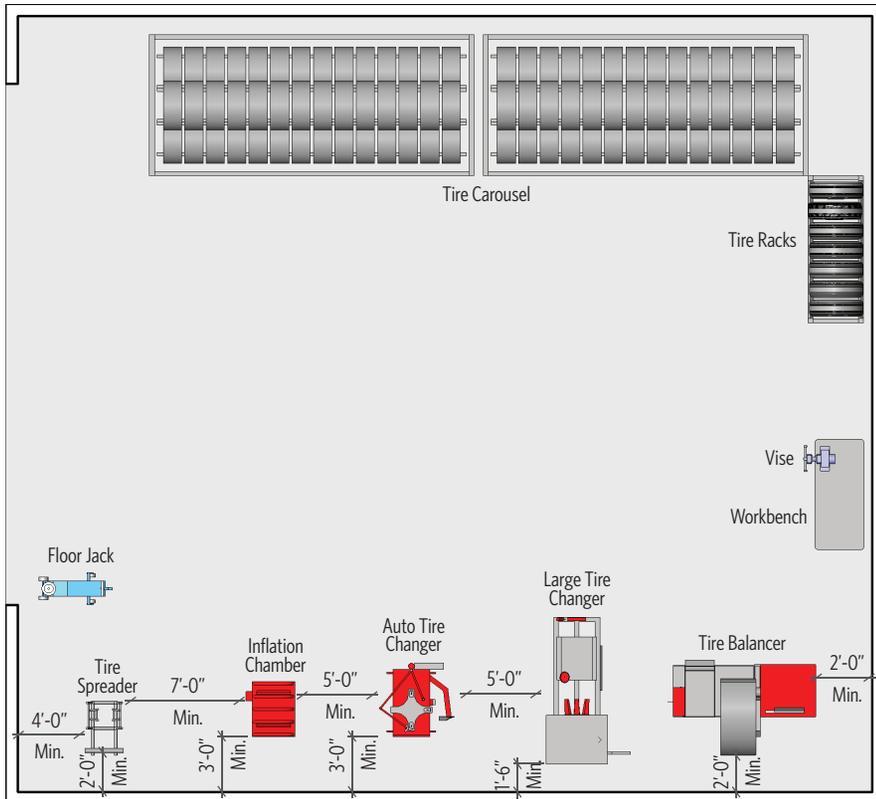

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (four minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (50 fc average)
  - ✓ Fixtures located to illuminate work spaces and around the vehicles
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

BATTERY REBUILD SHOP

BATTERY REBUILD SHOP

<p><b>DESIGN FEATURES</b></p> <ul style="list-style-type: none"> <li>• Forklift access</li> <li>• Physically separated from other areas to prevent migration of noise, dirt and fumes, if possible</li> <li>• Natural daylighting desired</li> </ul>		

TIRE SHOP/STORAGE

**TIRE SHOP/STORAGE**

**FUNCTION**

Repair, changing, balancing, and storage of tires.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to 60 Foot Bus Tire Bay
- Access to Common Work Area and Parts Storage

**CRITICAL DIMENSIONS**

- 19'-0" vertical clearance to structure and fixtures

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Forklift access
- Access to exterior for delivery of tires
- Physically separated with full height walls from other areas to prevent migration of noise, dirt, and fumes
- Natural daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities, light colored finish

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed for equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- In-floor radiant heat (if desired)
- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- As required by equipment

**PLUMBING CONSIDERATIONS**

- Compressed air:
  - ✓ 2'-0" compressed air piping loop (minimum)
  - ✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- As required by equipment

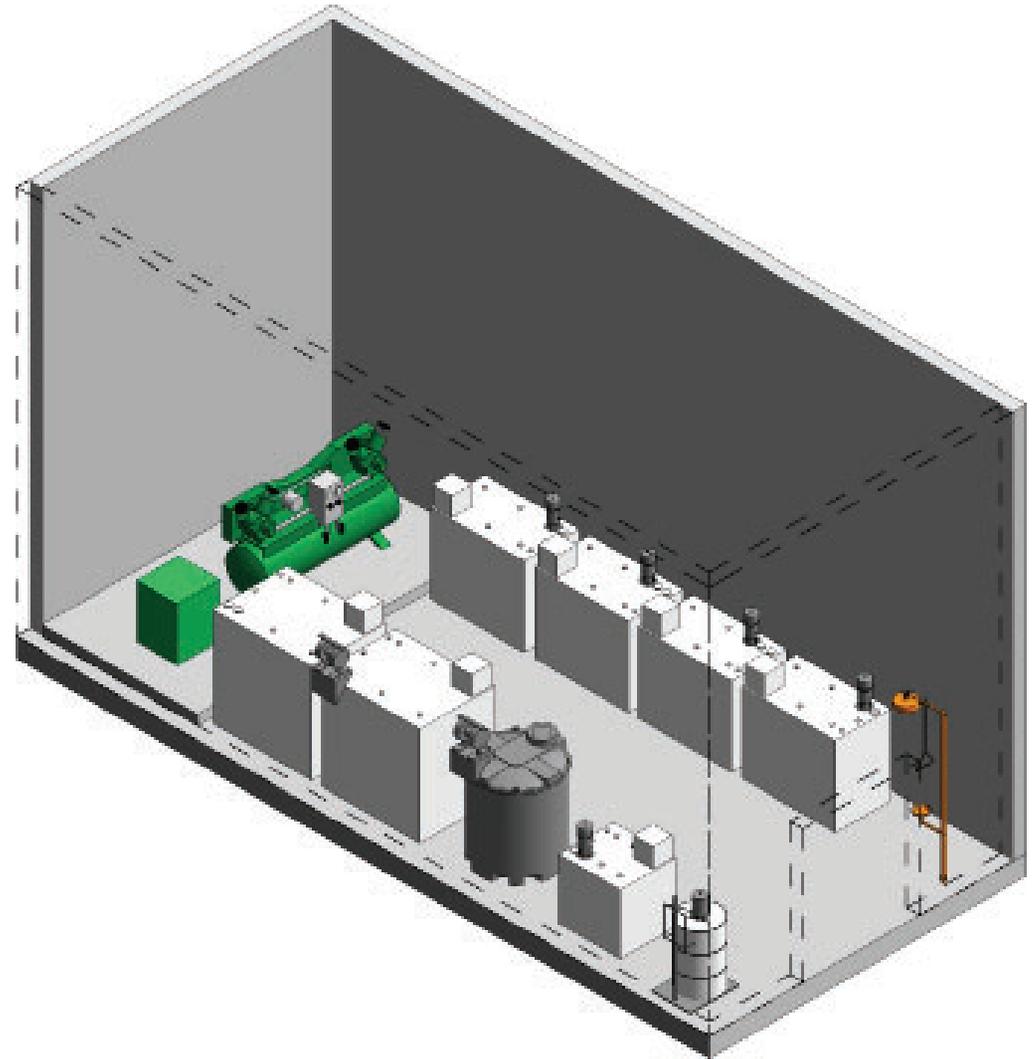

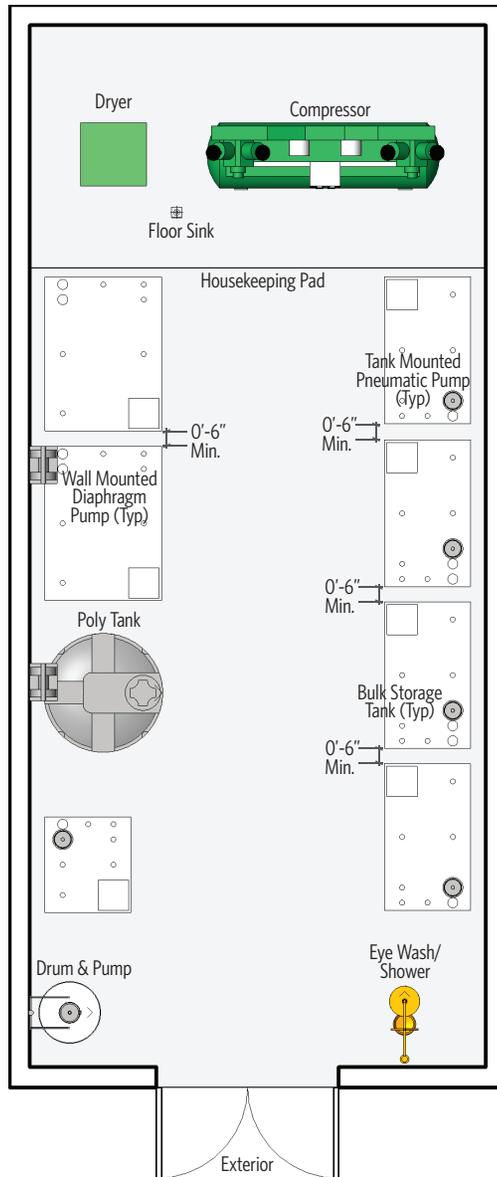

**ELECTRICAL CONSIDERATIONS**

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (five minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum in Storage Area (15 fc average) and Shop Area (25 fc average)
  - ✓ Fixtures located to illuminate work spaces and around the vehicles
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

**FIRE SUPPRESSION CONSIDERATIONS**

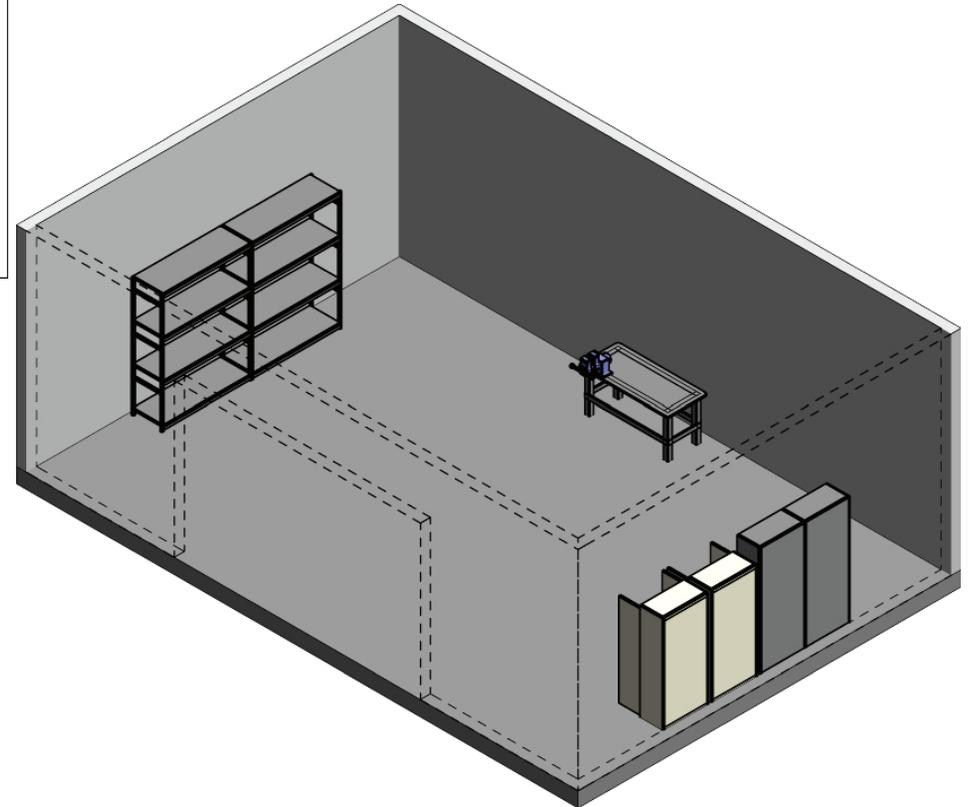

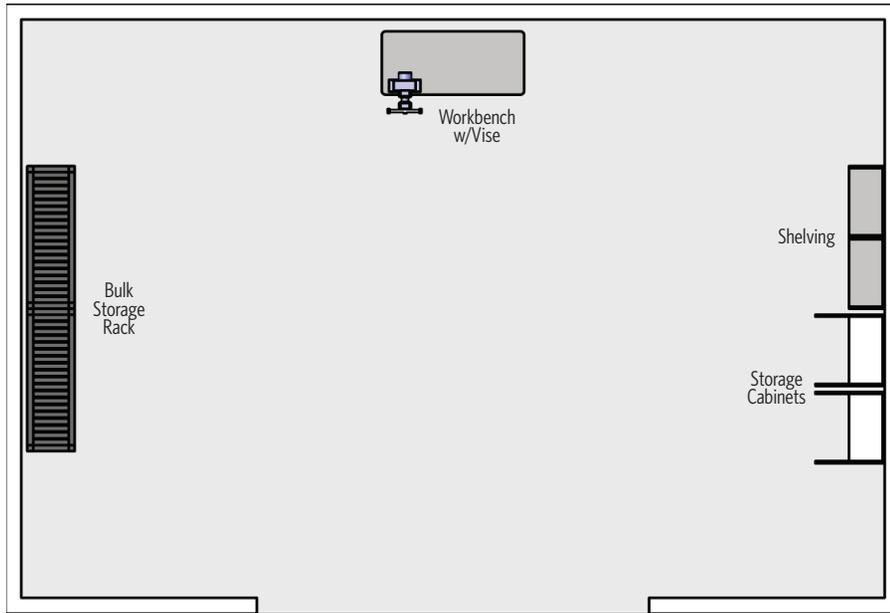

The fire protection and pyrotechnics experts on the detailed design team will be responsible for devising a robust fire protection system for the tire bay and tire shop/storage areas that minimizes risk to the Yard and any joint development above. Review and recommendations by these experts will include, but not be limited to, the location, ventilation, and fire suppression systems for Potrero Yard's tire facilities.

LUBE/COMPRESSOR ROOM

LUBE/COMPRESSOR ROOM		
<p><b>FUNCTION</b></p> <p>Enclosed room for storage and central distribution of lubricants. Space shall include a compressor(s) and refrigerated air dryer(s).</p>	<p><b>ARCHITECTURAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Finishes:                             <ul style="list-style-type: none"> <li>✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer</li> <li>✓ Walls: Soil and grease resistant, with light colored finish sound absorption material</li> <li>✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities, with light colored finish, and sound absorption material</li> </ul> </li> <li>• Doors:                             <ul style="list-style-type: none"> <li>✓ Personnel door with view panel to meet applicable code exit requirements</li> <li>✓ Double 6'-0" wide door with interior exit device</li> <li>✓ No thresholds</li> </ul> </li> <li>• Acoustics: Determine based on equipment and location of adjacent spaces</li> </ul>	<p><b>PLUMBING CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Compressed air:                             <ul style="list-style-type: none"> <li>✓ Duplex air compressor, air dryer, and air receiver</li> <li>✓ Floor sink between air compressor and dryer. Plumb to central sediment and oil interceptor</li> <li>✓ 2'-0" compressed air piping loop (minimum) started in the Lube/Compressor Room</li> <li>✓ Compressed air line with 3/8" and 1/2" shut-off valve, separator, regulator with gauge, lubricator, and quick disconnect on wall at 4'-0" AFF</li> <li>✓ Connect to lubricant pumps</li> </ul> </li> <li>• Tank mount all piston lubricant pump(s)</li> <li>• Wall mount all diaphragm pump(s)</li> <li>• CG pump mounted to an air operated hoist (if required)</li> <li>• Plumb tanks to corresponding lube reel banks located in the Repair Bays</li> <li>• Plumb UC tanks to corresponding pumps located in the Repair Bays (if required)</li> <li>• 3/4" water hose bibb with standard faucet 2'-0" AFF</li> <li>• Emergency eyewash</li> </ul>

<p><b>EQUIPMENT/FURNISHINGS</b></p> <ul style="list-style-type: none"> <li>• Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment</li> </ul>		
<p><b>DESIGN FEATURES</b></p> <ul style="list-style-type: none"> <li>• Exterior access for deliveries</li> <li>• Acoustically and physically separated from other areas to prevent migration of noise, dirt, and fumes</li> </ul>		

MINOR BODY SHOP

**MINOR BODY SHOP**

**FUNCTION**

Designated shop for minor body repair or replacement and storage.

**RELATIONSHIP TO OTHER AREAS**

- Open to Minor Body Bay

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Forklift access
- Physically separated from other areas to prevent migration of noise, dirt and fumes, if possible
- Natural daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- In-floor radiant heat (if desired)
- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- Exhaust and makeup air for dust collection system
- As required by equipment

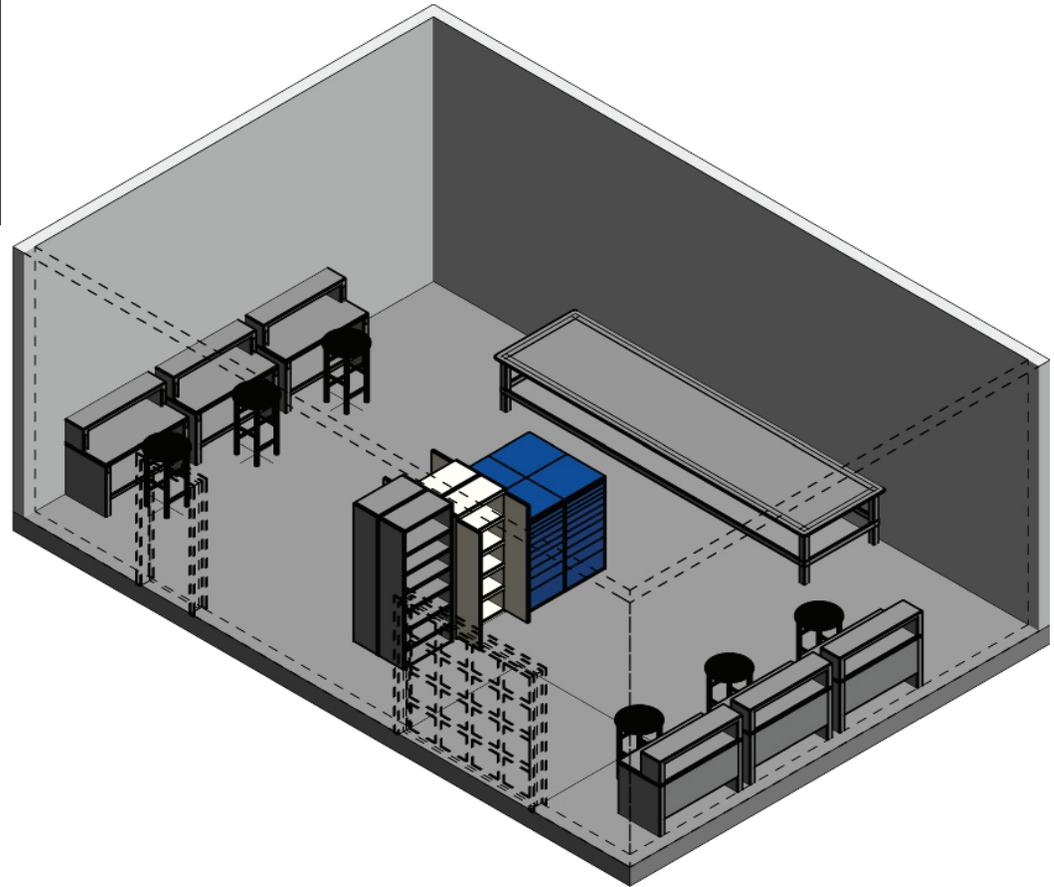

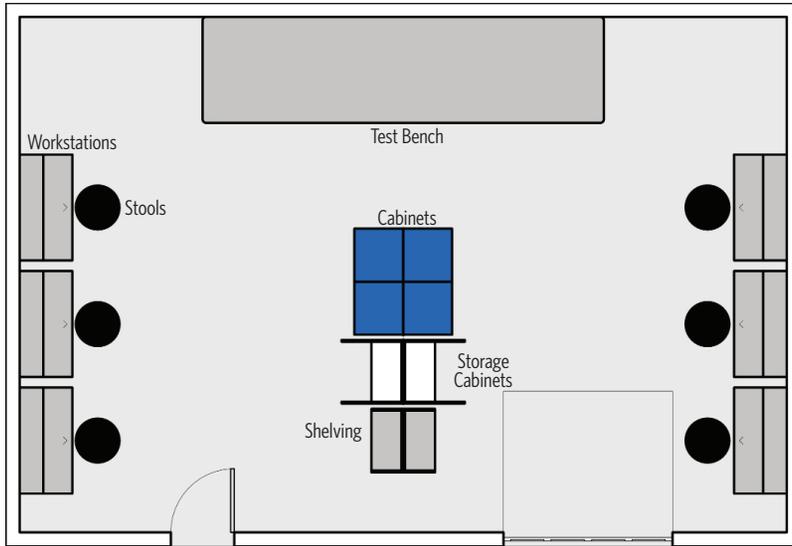

**PLUMBING CONSIDERATIONS**

- Compressed air drop:
  - ✓ 2'-0" compressed air piping loop (minimum)
  - ✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- Water: 3/4" water hose bibb with standard hose bibb at 2'-0" AFF
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (50 fc average)
  - ✓ Fixtures located to illuminate work spaces and around the vehicles
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (four minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

ELECTRONIC BENCH SHOP

ELECTRONIC BENCH SHOP		
<p><b>FUNCTION</b></p> <p>Enclosed area for repairing and modifying trolleys and future BEBs electronic and computer control systems. SECTION 5.4: FARE BOX AND  
CLIPPER CARD READER  
REPAIR SHOP

GENERAL OFFICE MODULES: OFFICE AREAS

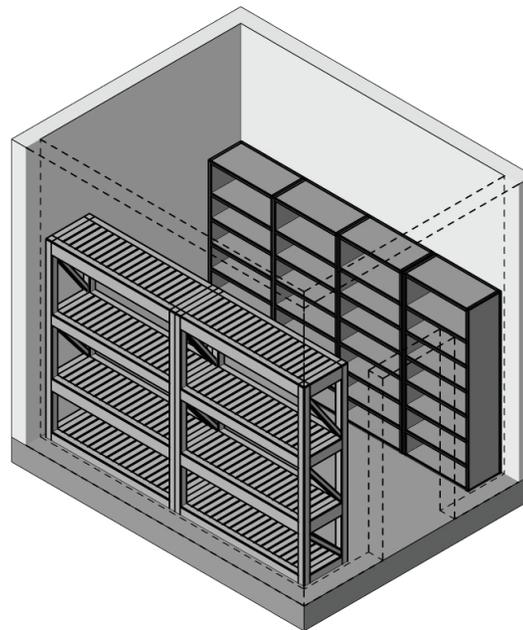

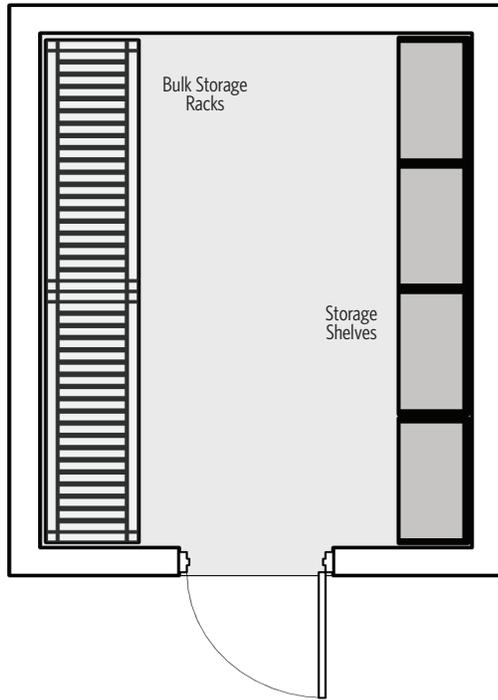

MANAGER

- Reference **Office Module Private Office- 120 sf**
- Adjacent to Fare Box Staff

FARE BOX STAFF

- Reference **Office Module Workstation- 64 sf**
- Adjacent to Manager
- Adjacent to Shop, Storage, and Parts Storage

**INCOMING AND OUTGOING DEVICE STORAGE**

**FUNCTION**

Storage of the fare box and clipper card readers when needing repair and repair is completed.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Fare Box Staff

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

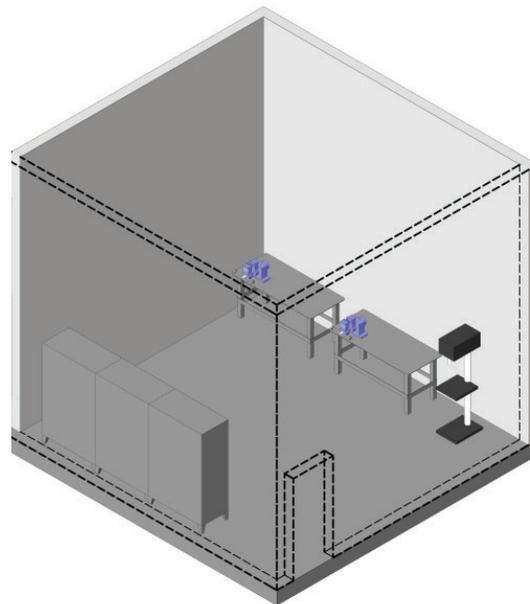

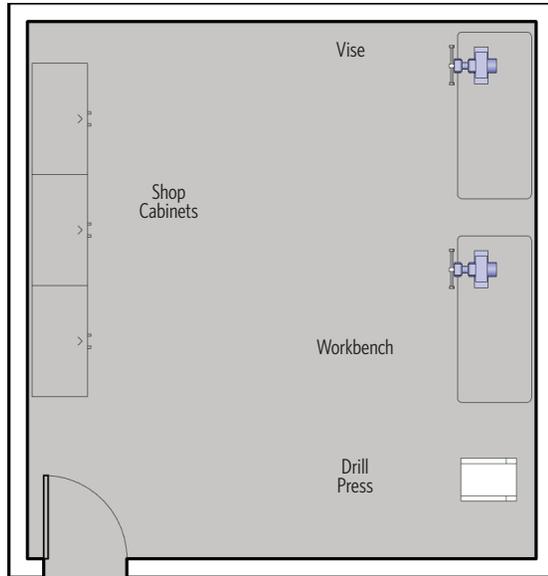

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

SHOP

FUNCTION

Designated shop for repair of fare boxes and clipper readers.

RELATIONSHIP TO OTHER AREAS

- Adjacent to Fare Box Staff, Storage, and Parts Storage

CRITICAL DIMENSIONS

- 12'-0" vertical clearance to structure and fixtures

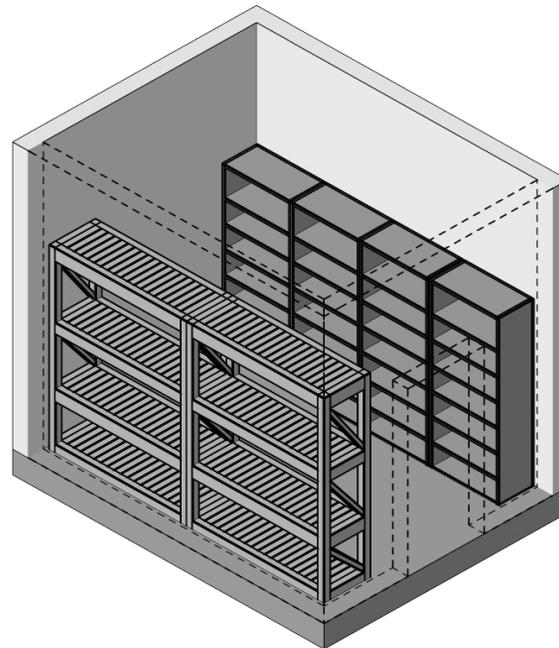

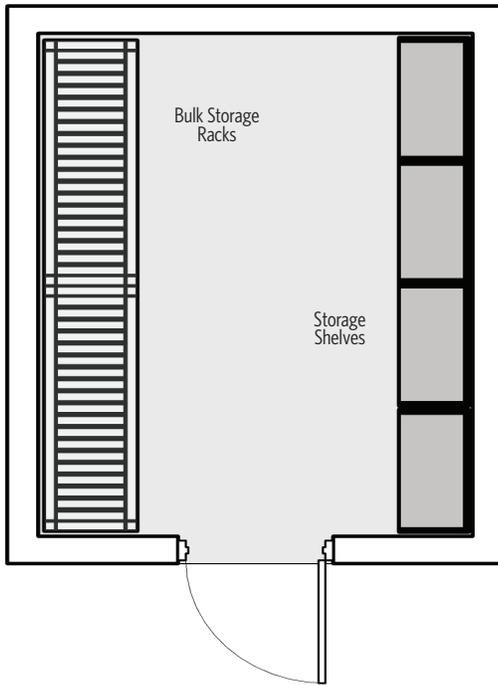

EQUIPMENT/FURNISHINGS

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

**STORAGE**

**FUNCTION**

Dedicated secure storage for fare box and clipper reader supplies.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Shop and Parts Storage

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

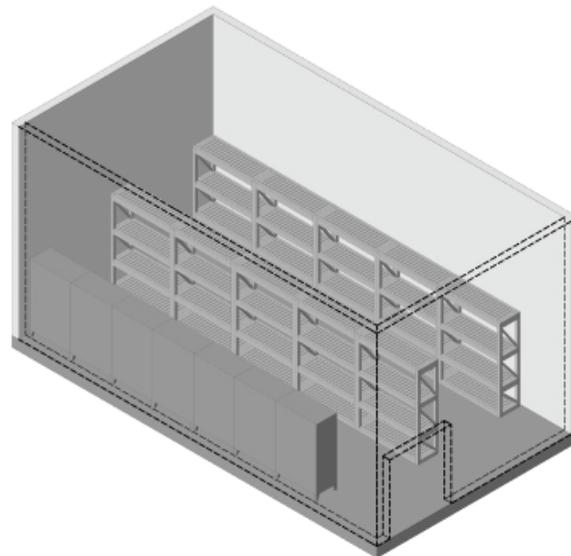

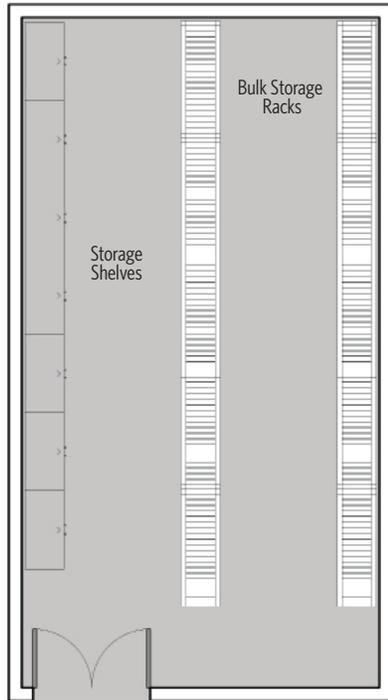

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

**PARTS STORAGE**

**FUNCTION**

Dedicated storage for fare box and clipper reader components.

**RELATIONSHIP TO OTHER AREAS**

- N/A

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

# SECTION 5.5: SERVICE AND CLEAN

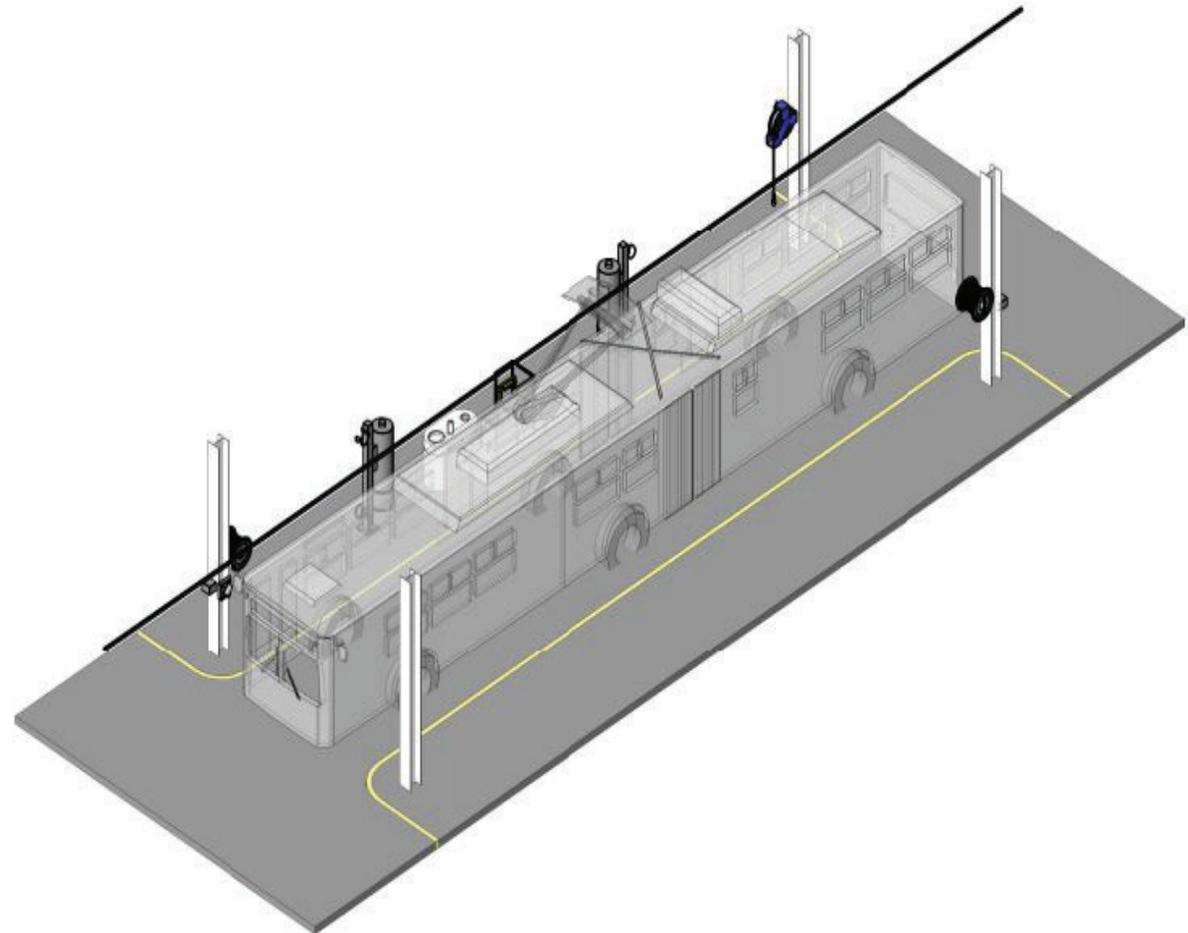

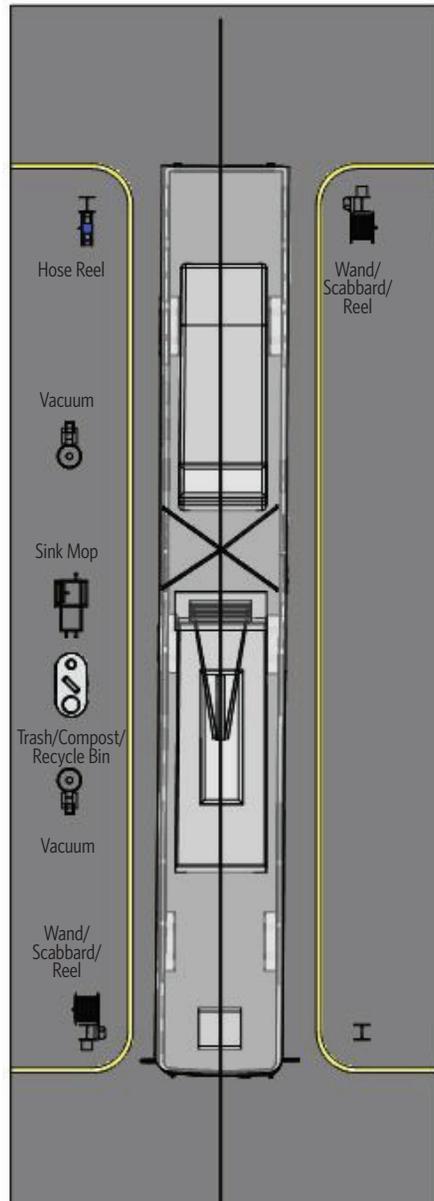

GENERAL OFFICE MODULE: OFFICE AREAS

SERVICE SUPERVISOR OFFICE

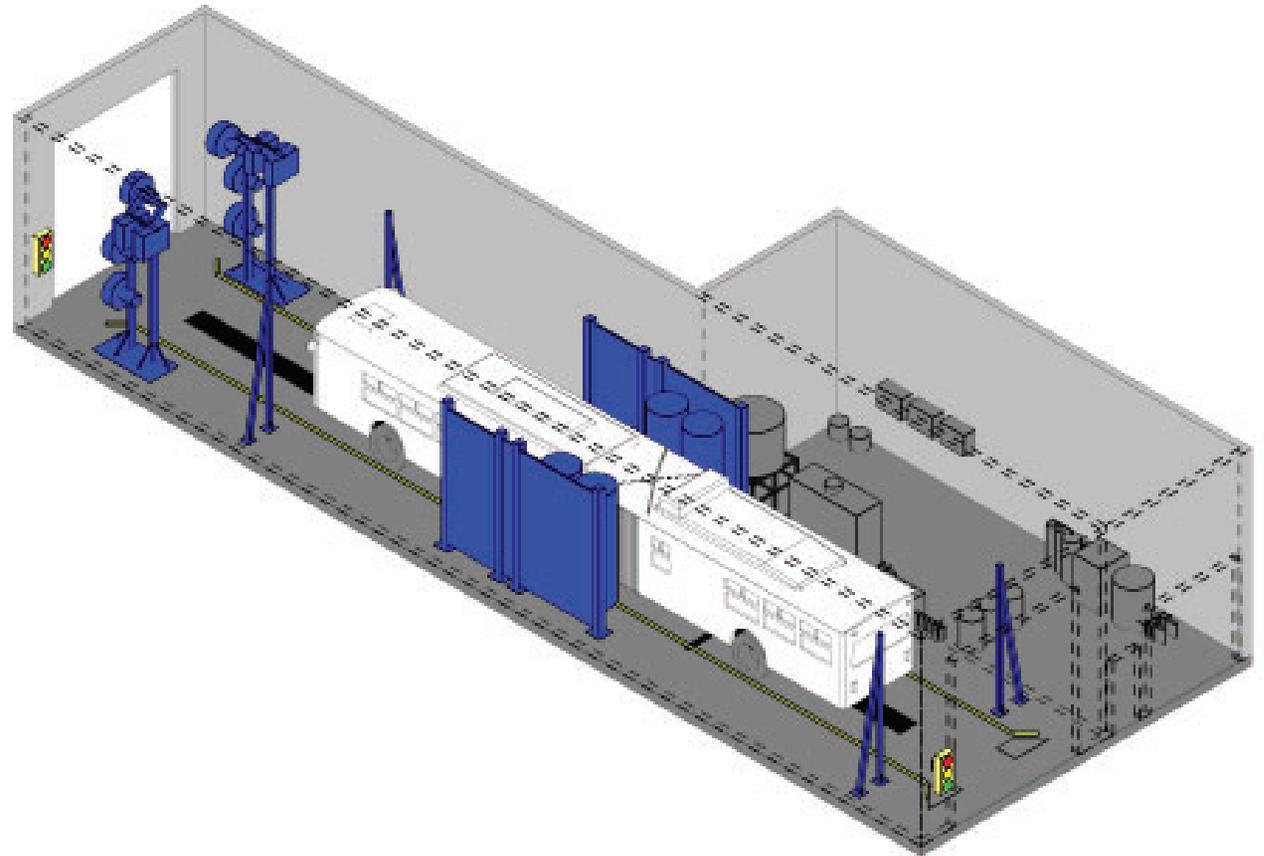

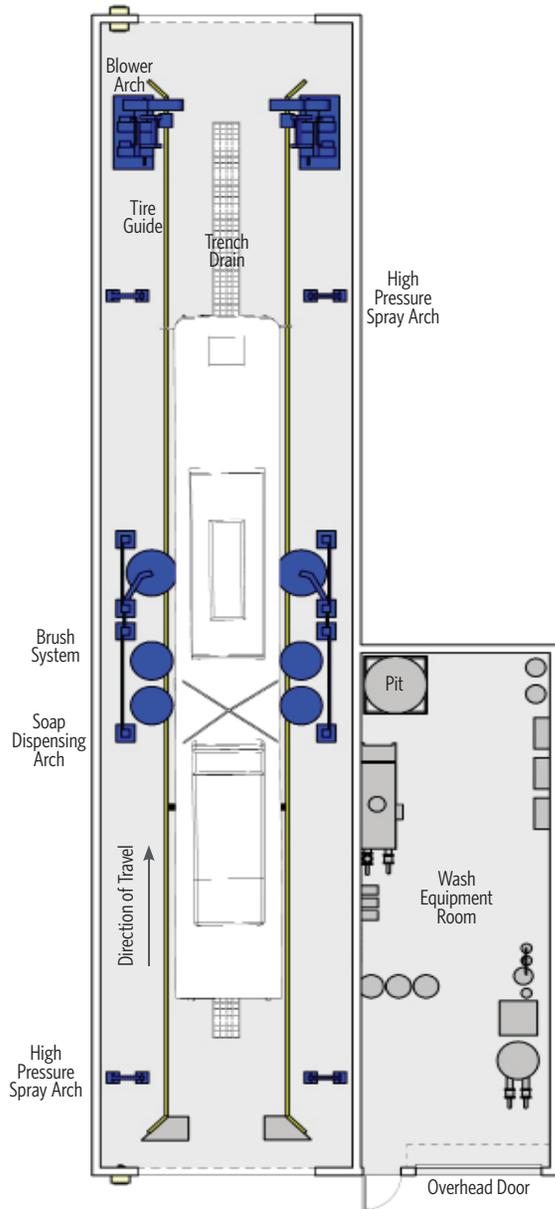

- Reference **Office Module Shared Office**
- Adjacent to Service Position and Bus Washer

SERVICE POSITION

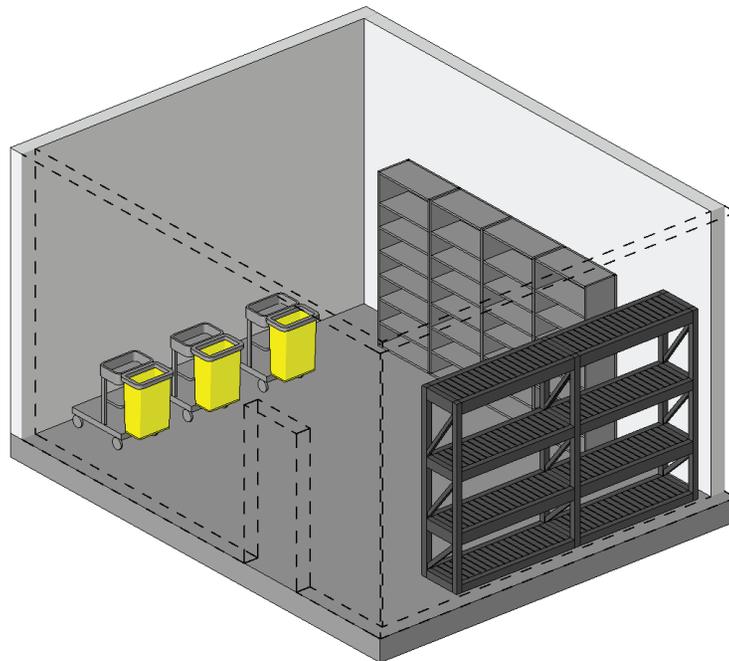

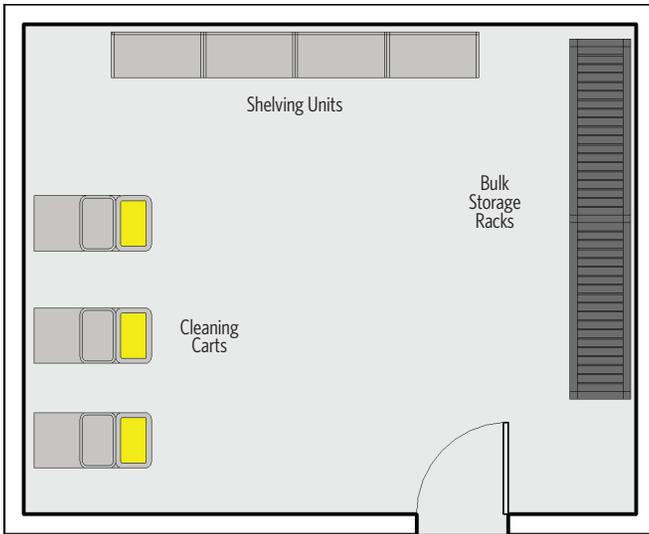

SERVICE POSITION		
<p><b>FUNCTION</b></p> <p>Dedicated bay used for nightly servicing, fluid level checks, and tire pressure checks. CLEANING EQUIPMENT STORAGE

FUNCTION

Secure room for storage of vehicle cleaning equipment.

RELATIONSHIP TO OTHER AREAS

- Adjacent to service position

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

EQUIPMENT/FURNISHINGS

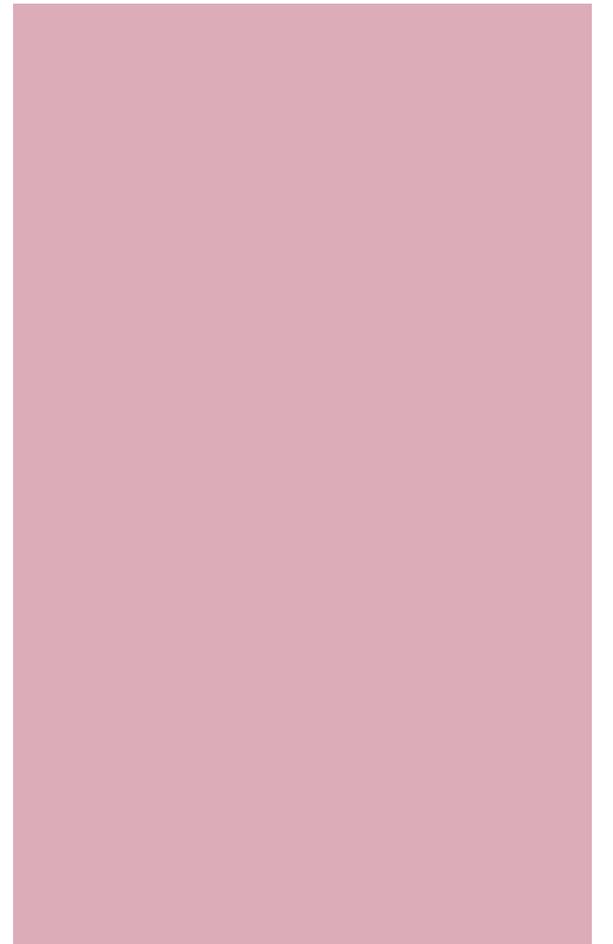

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: finished concrete (recommended)
  - ✓ Walls: Soil and grease resilient, with light color finish
  - ✓ Ceiling: Painted exposed structure
  - ✓ Doors:
    - Personnel door with view panels to meet applicable code exit requirements.
    - Electronically secured entry (as required)
- Mechanical: Provide appropriate balanced cooling, heating, and ventilation (per code)
- Power:
  - ✓ LED lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

## SECTION 5.6: PARTS

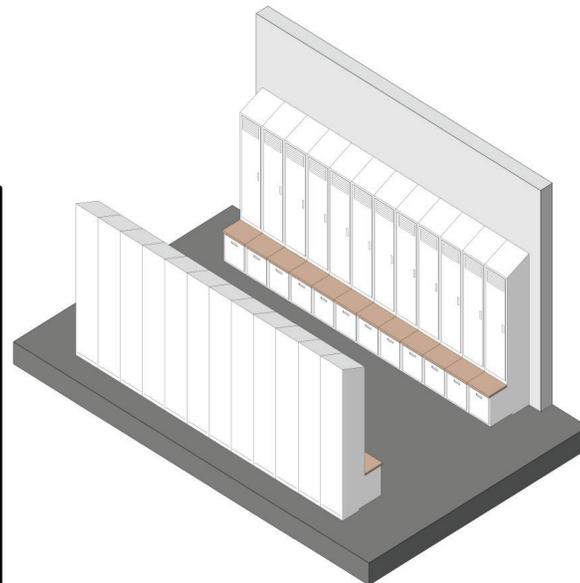

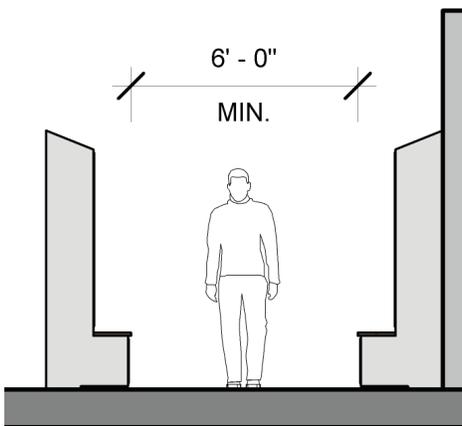

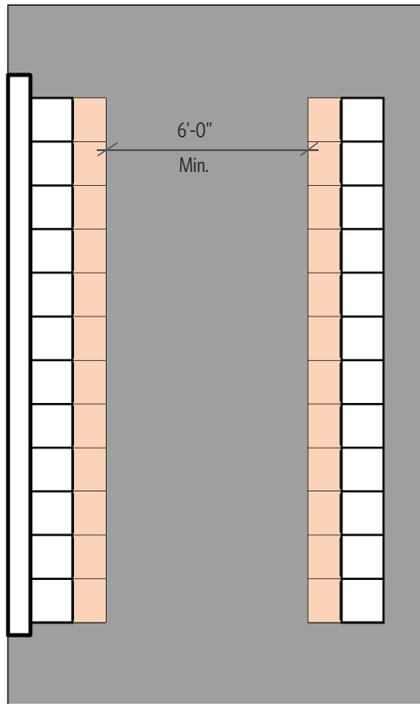

GENERAL MODULE: OFFICE AREAS

PARTS SUPERVISOR

- Reference **Office Module Private Office - 120 sf**
- Adjacent to Parts Storage
- Adjacent to Shopkeepers

**PARTS LOCKERS**

**PARTS**

Locker area for each Parts employees. Locker areas must be appropriately sized to meet the needs of Parts staff.

**RELATIONSHIP TO OTHER AREAS**

- Located within Parts Room

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

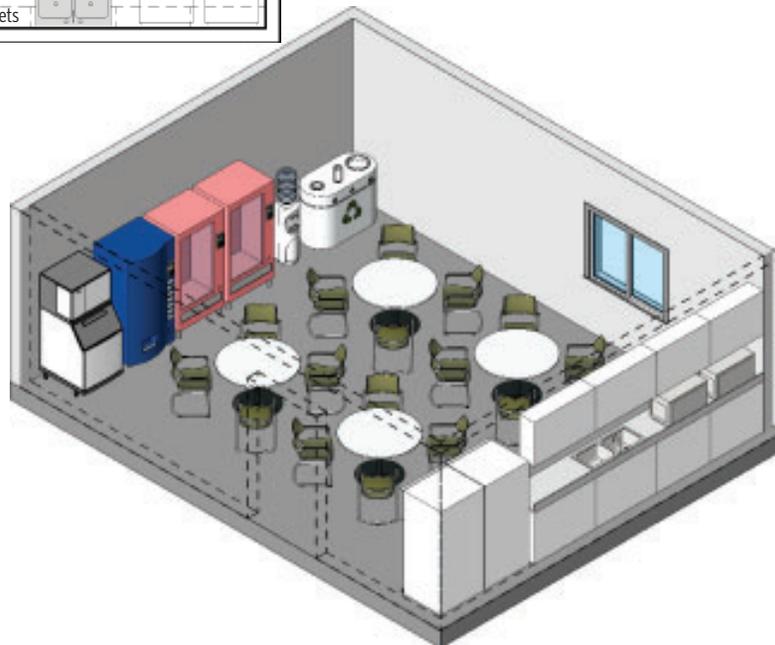

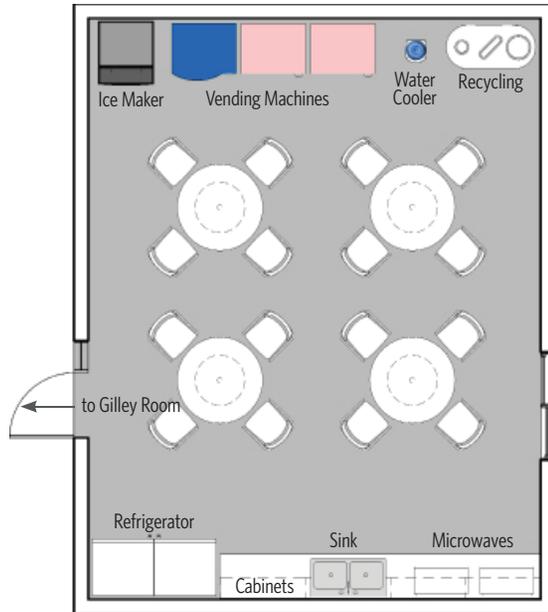

**EQUIPMENT/FURNISHINGS**

- 6'-0" high gear, well-ventilated lockers with built-in bench
- Lockers must be ADA compliant and have mirrors
- Locker Dimensions: 24" by 24"
- Lockers to have sloped tops

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering or finished concrete (recommended)
  - ✓ Walls:
    - Tile covering or finished masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (15 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**BREAK ROOM**

**FUNCTION**

Area used for staff to eat, prepare, and store food.

**RELATIONSHIP TO OTHER AREAS**

- Located within Parts Room.

**CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

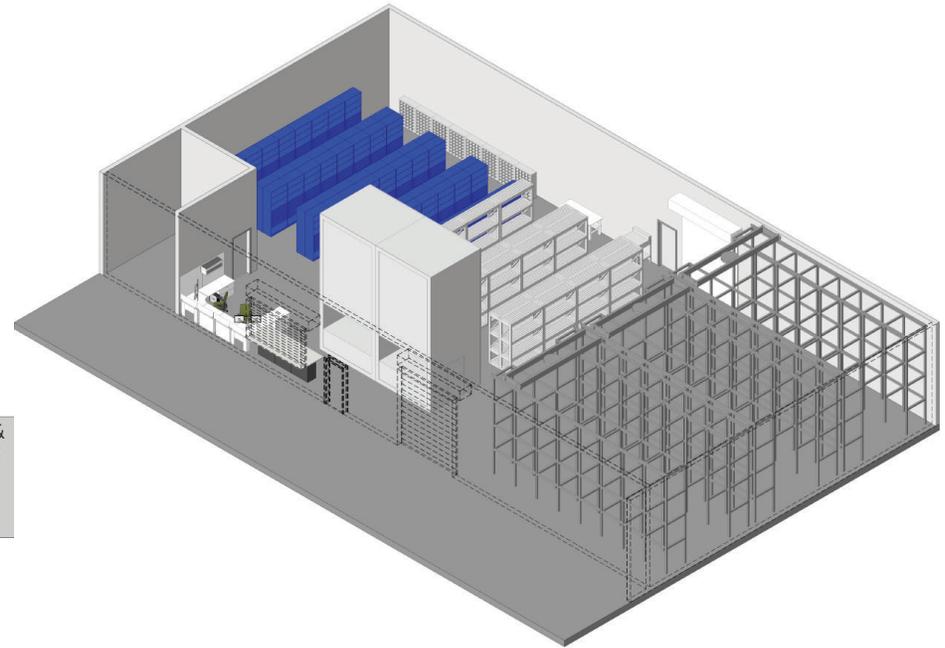

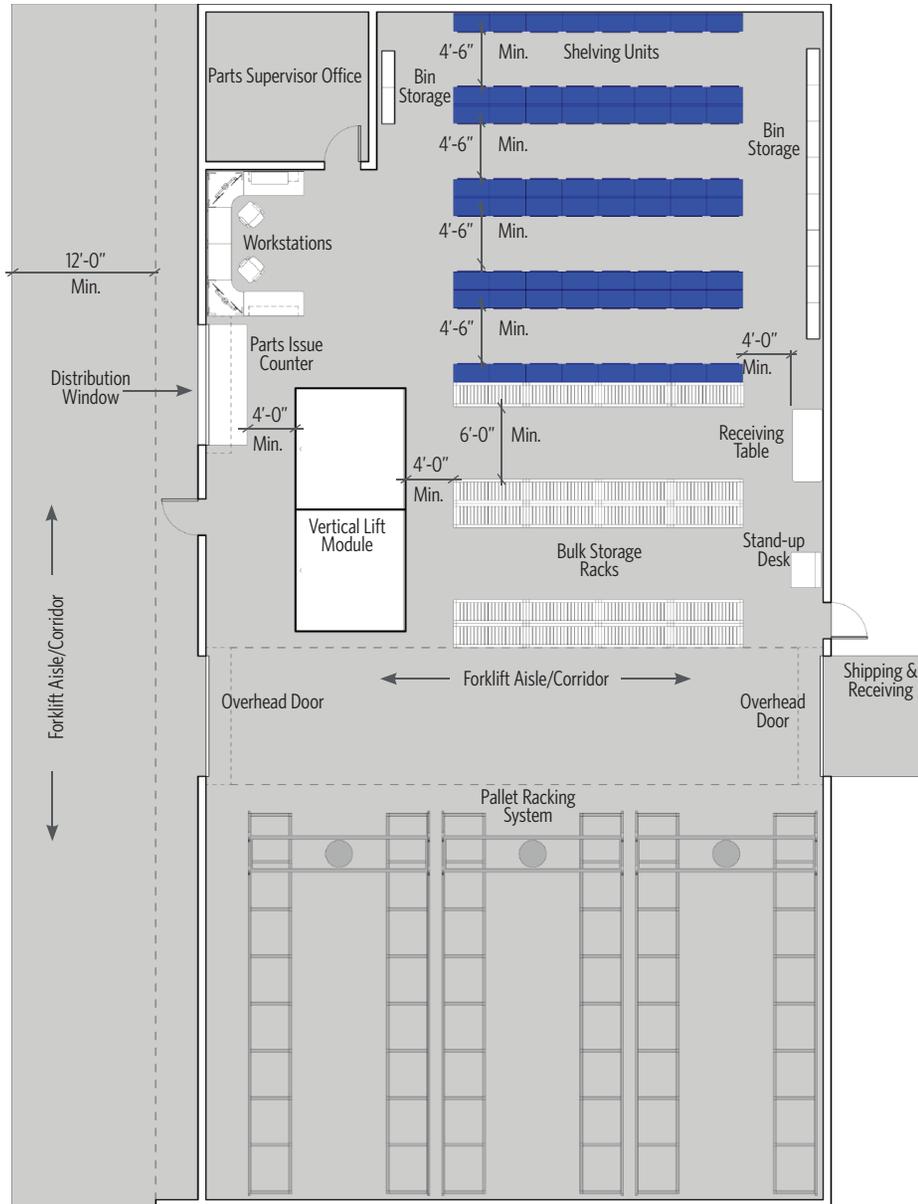

**EQUIPMENT/FURNISHINGS**

- Counter, upper and lower cabinets, sink with water filter, microwaves, refrigerators, coffee maker, ice maker, water coolers, vending machines, trash/recycling/compost bins, tables, chairs
- Millwork

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Plumbing: Rough-in for equipment
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide three GFCI outlets above the kitchenette counter
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

PARTS WINDOW/SHOPKEEPER/PARTS STORAGE/SHIPPING AND RECEIVING

**PARTS WINDOW/SHOPKEEPER/PARTS STORAGE/SHIPPING AND RECEIVING**

**FUNCTION**

Dedicated secure area for receiving, storage, and issuing of parts, material, and specialized tools.

**RELATIONSHIP TO OTHER AREAS**

- Access to exterior for deliveries
- Adjacent to Parts Office
- Access from Repair Bays and Shops

**CRITICAL DIMENSIONS**

- Vertical clearance below mezzanine: 12'-0" (minimal) (if mezzanine is desired)
- Vertical clearance above mezzanine: 15'-0" (minimum)(if mezzanine is desired)
- 20'-0" clear for high bay pallet storage (minimum)
- VLM or stack system can be any desired height

**EQUIPMENT/FURNISHINGS**

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Exterior access for deliveries
- Provide Issue Counter with stainless steel top and fire rated rolling overhead door
- Provide staging area for shipping/receiving with an overhead door to exterior of building
- Forklift access
- Parts deliveries should be as functionally separated and as secure as possible in relation to any public accessible and joint development area in the basement.

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish
- Doors:
  - ✓ Personnel door with view panel to meet applicable code exit requirements
  - ✓ Exterior overhead door: High-lifting sectional, steel, insulated 10'-0" by 12'-0" with view panels, automatic operator, interior and exterior push button controls with lockout on exterior
  - ✓ Overhead door at Issue Window
  - ✓ Interior overhead door: Coiling steel, 10'-0" by 12'-0", automatic operator, push controls, lockable

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- Cooling set point: 74 degrees Fahrenheit
- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- In-floor radiant heat (if desired)
- As required by equipment

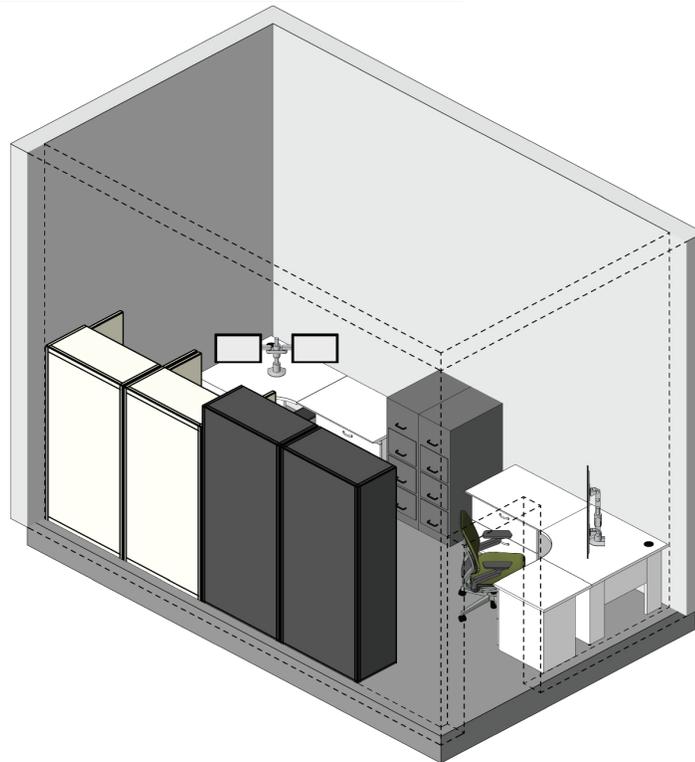

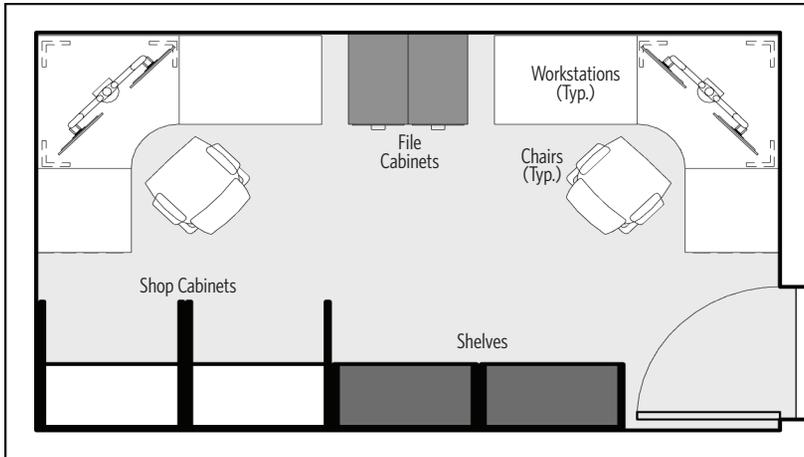

**PLUMBING CONSIDERATIONS**

- Water: 3/4" water hose bibb with standard hose bibb at 2'-0" AFF
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommended lighting levels for Parts Window, Shipping/Receiving, and Shopkeeper (35 fc average) and Storage Area (20 fc average)
  - ✓ Fixtures located to illuminate work spaces
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

RECEIVING OFFICE

FUNCTION

Workstations and storage for Receiving staff.

RELATIONSHIP TO OTHER AREAS

- Access to Parts Window/Shopkeeper/Parts Storage/ Shipping and Receiving/ Dock

CRITICAL DIMENSIONS

- 12'-0" vertical clearance to structure and fixtures

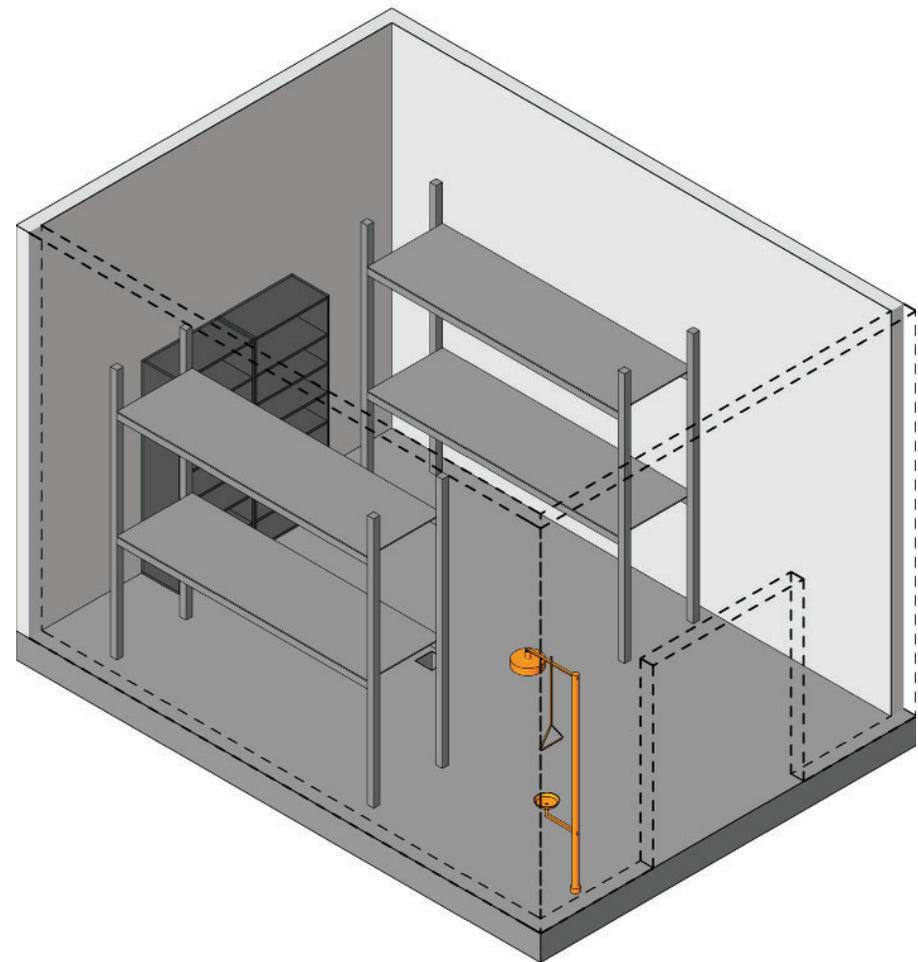

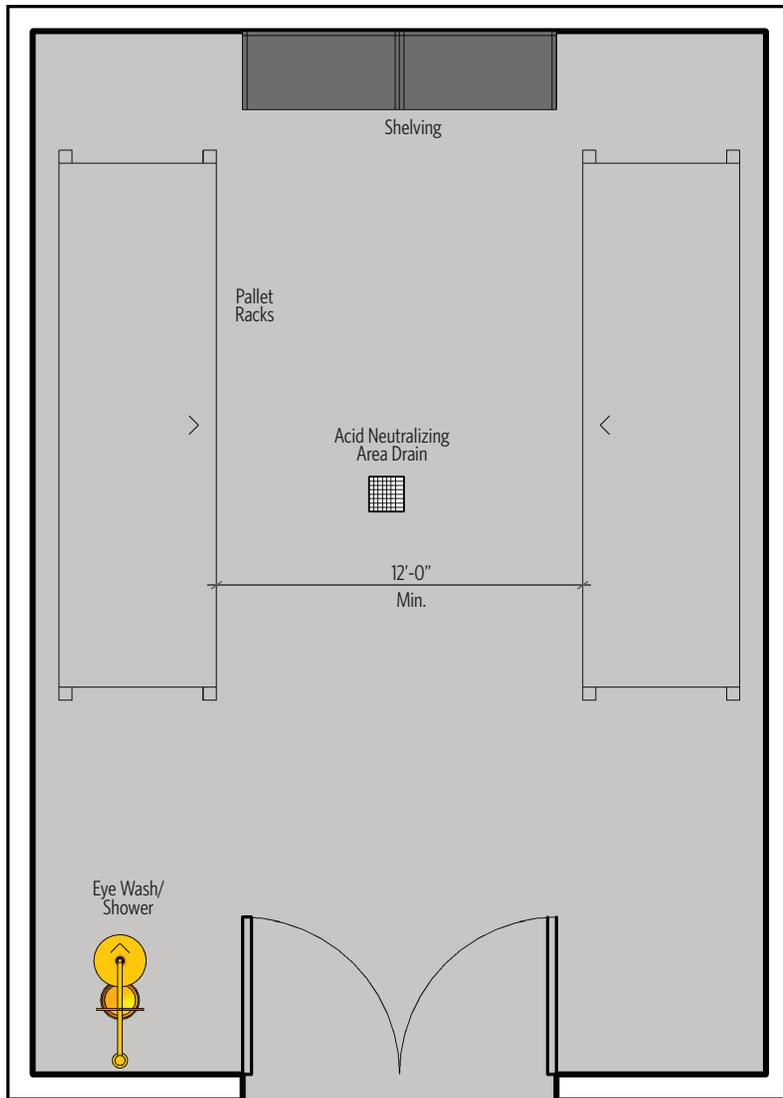

EQUIPMENT/FURNISHINGS

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

BATTERY STORAGE

**BATTERY STORAGE**

**FUNCTION**

Enclosed and secure room for storage of trolley and future BEBs batteries and components.

**RELATIONSHIP TO OTHER AREAS**

- Access from Repair Bays and Shops

**CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures (minimum)

**EQUIPMENT/FURNISHINGS**

- Emergency eyewash/shower
- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

**DESIGN FEATURES**

- Acoustically and physically separated from other areas to prevent migration of noise, dirt, and fumes

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete, and treated with chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finished concrete or masonry, with polyurea coatings for acid and chemical resistance
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities with light colored finish
- Doors:
  - ✓ Personnel door with view panel to meet applicable code exit requirements
  - ✓ Double 3'-0" wide doors

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- Heating set point: 65 degrees Fahrenheit
- Exhaust (per code)
- General ventilation (per code)
- As required by equipment

**PLUMBING CONSIDERATIONS**

- Tempered water: Connection to emergency eye wash/shower
- Acid neutralizing floor drain and piping to acid dilution tank

**ELECTRICAL CONSIDERATIONS**

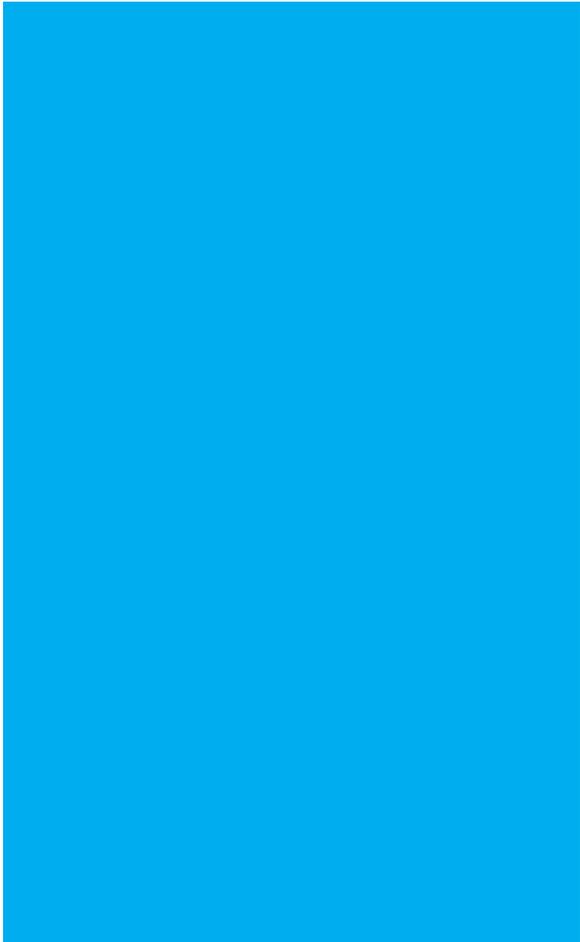

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles on walls
  - ✓ Dedicated computer receptacle, adjacent to data conduit on column adjacent to workbench
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum, explosion proof (20 fc average)
  - ✓ Fixtures located to illuminate work spaces
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns at each bay

**FIRE SUPPRESSION CONSIDERATIONS**

The fire protection and pyrotechnics experts on the detailed design team will be responsible for devising a robust fire protection system for the tire bay and tire shop/storage areas that minimizes risk to the Yard and any joint development above. Review and recommendations by the experts will include, but not be limited to, the location, ventilation, and fire suppression systems for Potrero Yard's tire facilities.

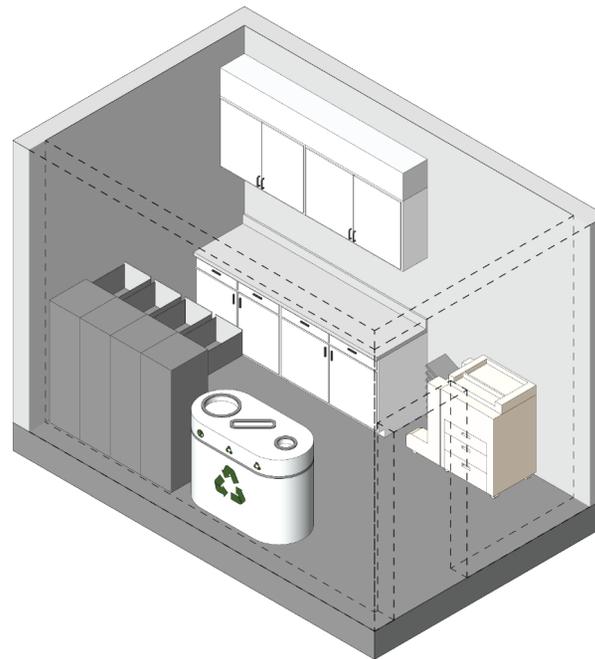

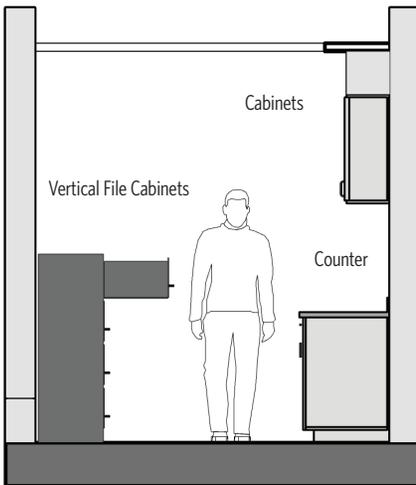

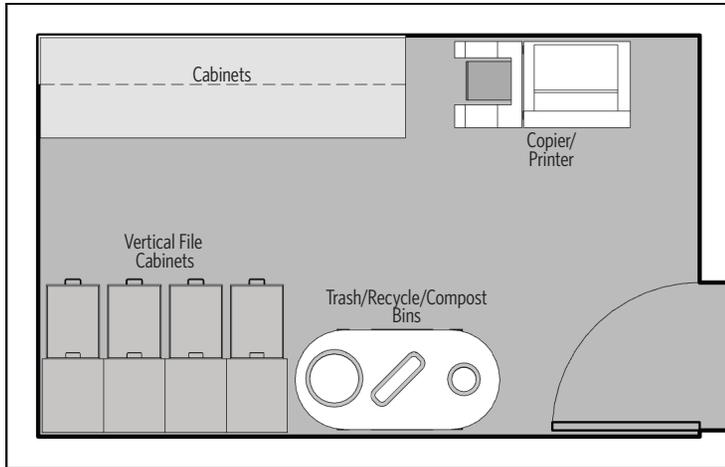

## SECTION 5.7: MAINTENANCE - ADMINISTRATION

**GENERAL MODULE: OFFICE AREAS**

SUPERINTENDENT	ASSISTANT SUPERINTENDENT	SENIOR CONTROLLER	ADMINISTRATIVE ASSISTANT		
<ul style="list-style-type: none"> <li>Reference <b>Office Module Private Office - 224 sf</b></li> <li>Adjacent to Assistant Superintendent</li> <li>Adjacent to Administrative Assistant</li> </ul>	<ul style="list-style-type: none"> <li>Reference <b>Office Module Private Office - 120 sf</b></li> <li>Adjacent to Superintendent</li> <li>Adjacent to Administrative Assistant</li> </ul>	<ul style="list-style-type: none"> <li>Reference <b>Office Module Private Office - 120 sf</b></li> <li>Adjacent to Assistant Superintendent</li> <li>Adjacent to Administrative Assistant</li> </ul>	<ul style="list-style-type: none"> <li>Reference <b>Office Module Workstation - 48 sf</b></li> <li>Adjacent to Superintendent and Assistant Superintendent</li> </ul>

**COPY/SUPPLY**

**FUNCTION**

Dedicated alcove or room for copier/printer/scanner/fax machine, storage for office supplies, and a work surface.

**RELATIONSHIP TO OTHER AREAS**

- Access to all office areas

**CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

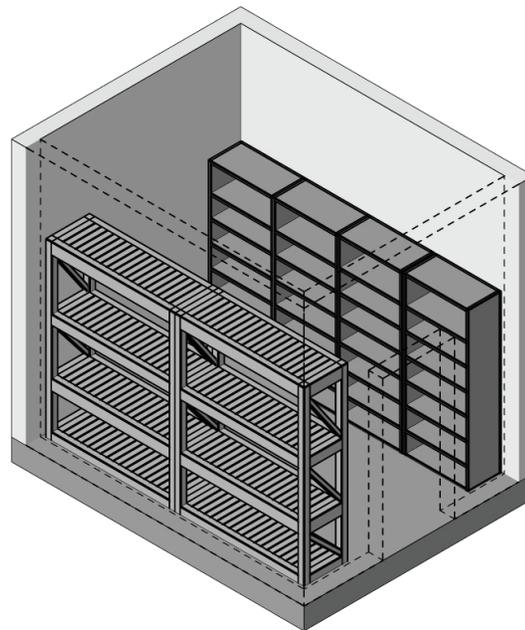

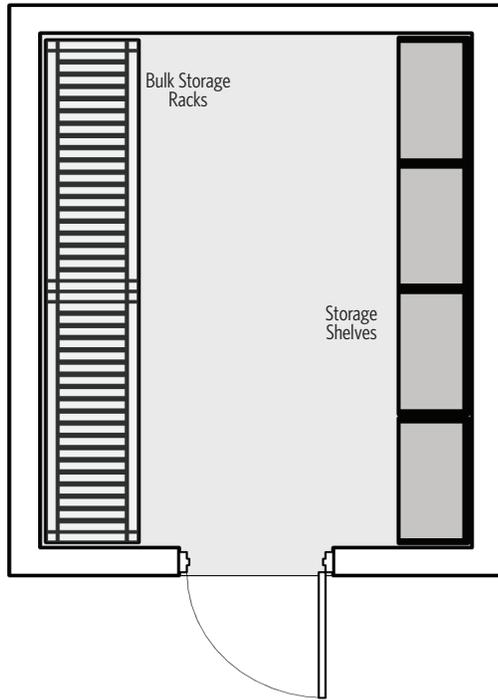

**EQUIPMENT/FURNISHINGS**

- Copier/printer/scanner/fax machine
- Work surface with cabinets below and above
- Filing cabinets
- Millwork

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide one data outlet with four data ports
  - ✓ Provide box conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**RECORDS STORAGE**

**FUNCTION**

Secure area for the storage of files and records.

**RELATIONSHIP TO OTHER AREAS**

- N/A

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

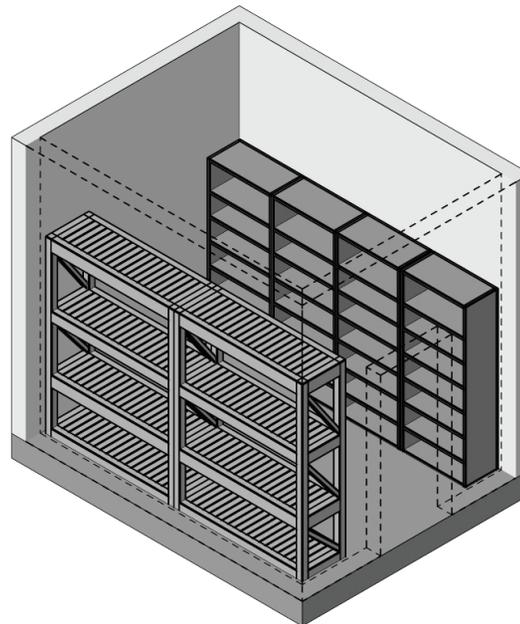

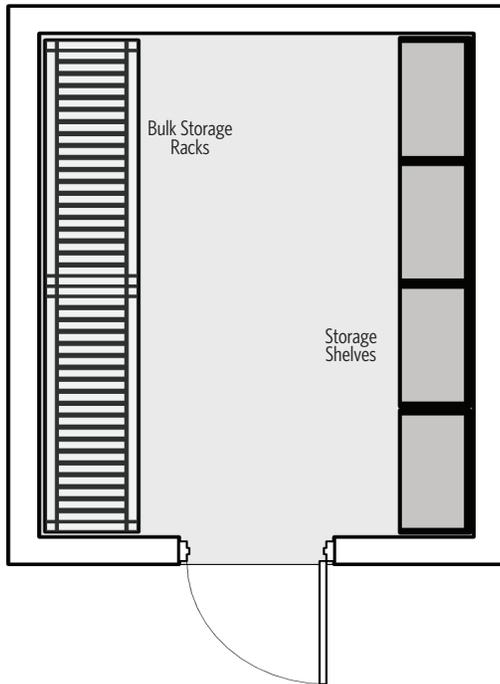

**EQUIPMENT/FURNISHINGS**

- Shelving
- Racking

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (35 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

**ARCHIVE RECORDS STORAGE**

**FUNCTION**

Secure area for the long term storage of archived files and records.

**RELATIONSHIP TO OTHER AREAS**

- N/A

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

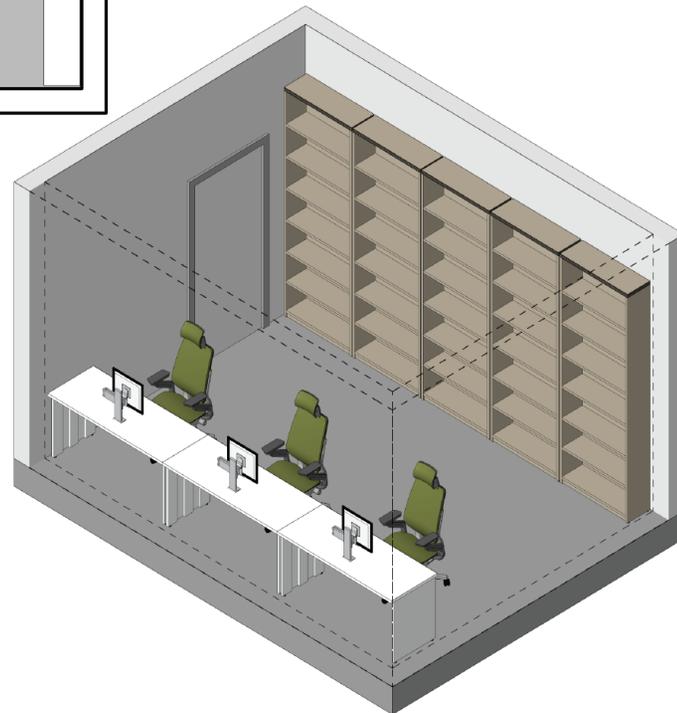

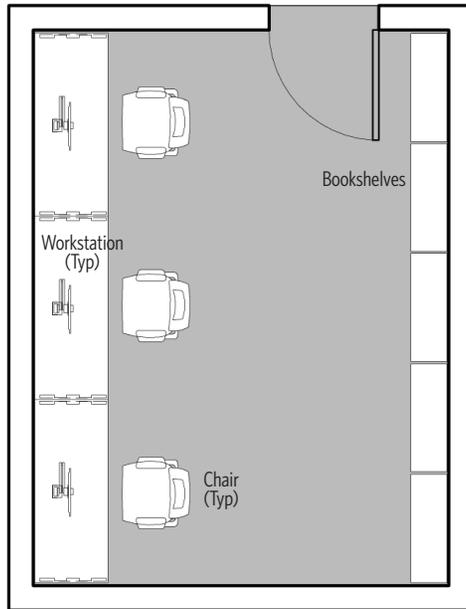

**EQUIPMENT/FURNISHINGS**

- Shelving
- Racking

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

**LIBRARY/ONLINE RESOURCES**

**FUNCTION**

Enclosed area for storage and reference of vehicle maintenance reference manuals and materials.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Repair Bays
- Adjacent to Maintenance-Administration open office area

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

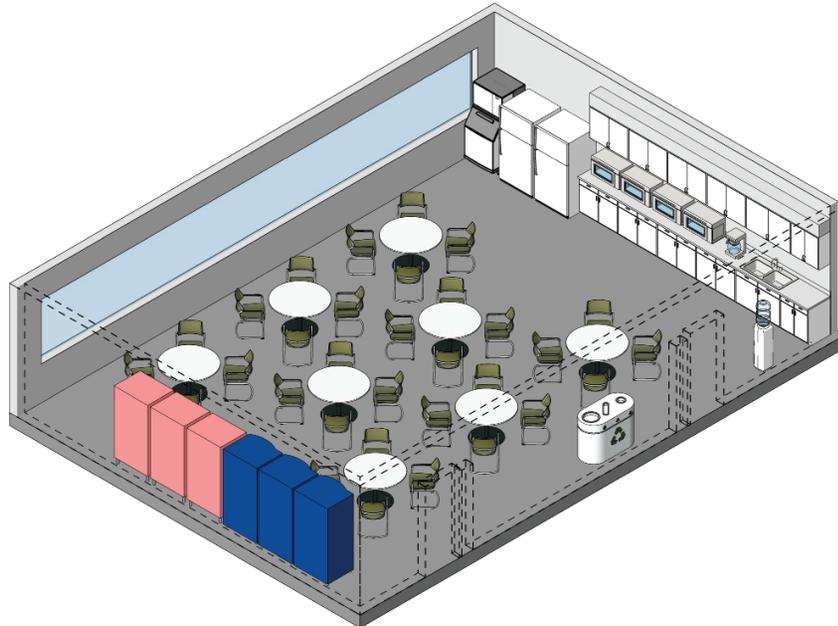

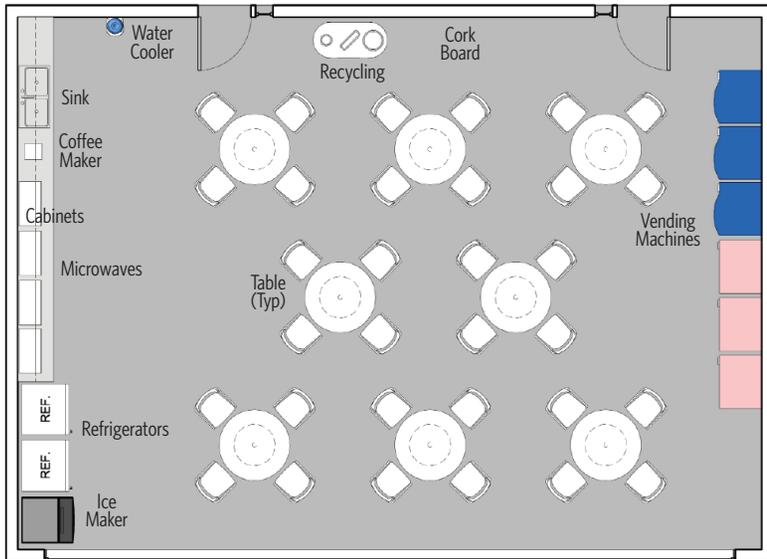

**EQUIPMENT/FURNISHINGS**

- Workstations
- Bookshelves
- Chairs

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc of indirect lighting average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

**BREAK ROOM/KITCHENETTE/VENDING**

**FUNCTION**

Enclosed room for use by staff as a break area.

**RELATIONSHIP TO OTHER AREAS**

- Centrally located
- Access to all office areas, repair areas, and Restrooms

**CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

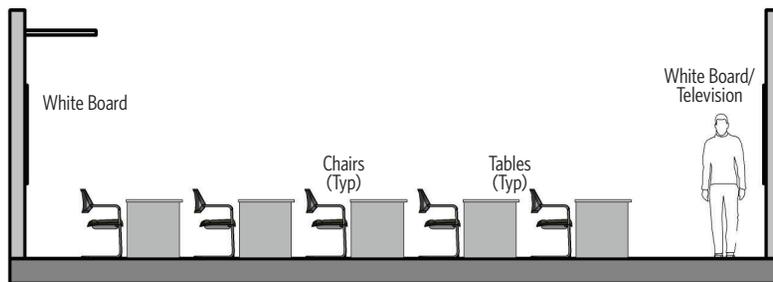

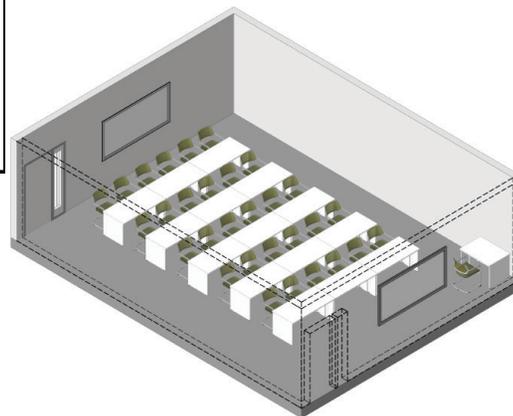

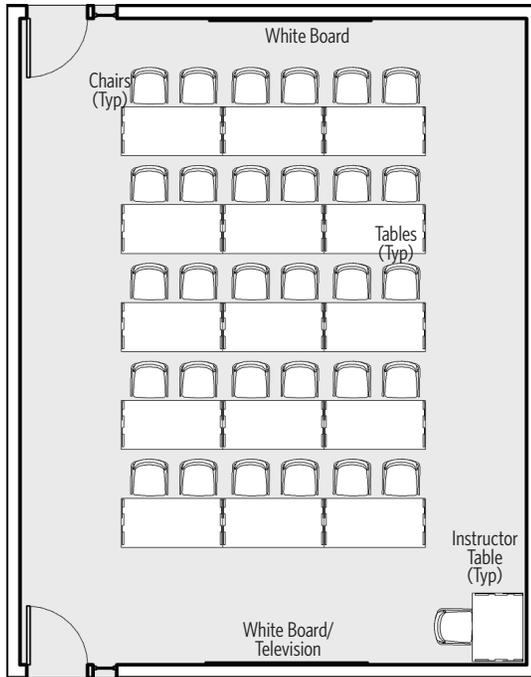

**EQUIPMENT/FURNISHINGS**

- Counter space, upper and lower cabinets, sink, microwaves, refrigerators, coffee maker, ice maker, water filter, vending machines, water coolers, tables, chairs, trash/recycling/compost bins
- Millwork

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Plumbing: Rough in for equipment
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide data outlets with four data ports (two minimum)
  - ✓ Provide five GFCI outlets above kitchenette counter
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**TRAINING ROOM**

**FUNCTION**

Large room for staff to participate in training activities. This space will also be available as a Conference Room, with training as the primary activity.

**RELATIONSHIP TO OTHER AREAS**

- Accessible by Maintenance staff
- Adjacent to Maintenance Office area

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

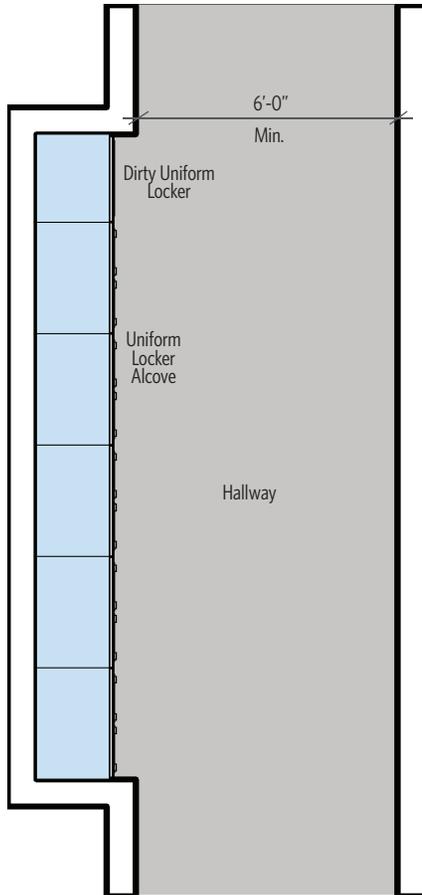

**EQUIPMENT/FURNISHINGS**

- Mayline Cohere Flip/nest table 60" by 30" laminate
- Cool mesh nesting chairs
- Whiteboard/Television
- Overhead projector
- Millwork

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Resilient floor covering with base (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Power:
  - ✓ LED lighting in accordance with IES recommendations (35 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of the table
  - ✓ Provide one data outlet with four data ports in the floor under the middle of the table
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

**UNIFORM ALCOVE**

**FUNCTION**

Co-ed locker area with an alcove for vendors to drop off and pick up uniforms (changing areas are located in the respective male/female restrooms).

**RELATIONSHIP TO OTHER AREAS**

- Accessible from Men's and Women's Lockers/Showers/Restroom
- Adjacent to an exterior door for vendor pickup/drop off

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

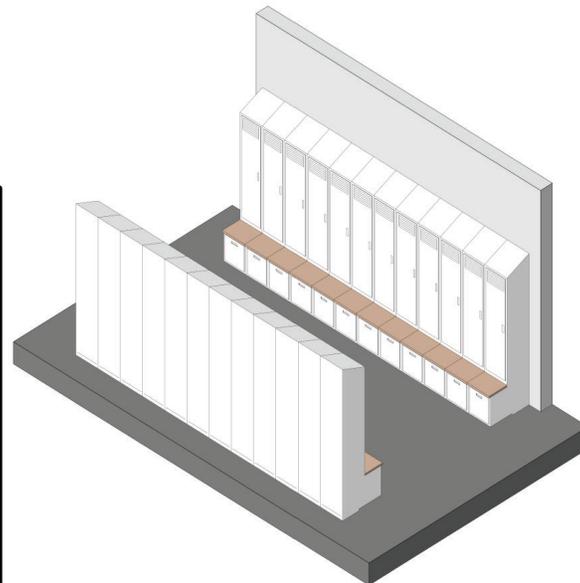

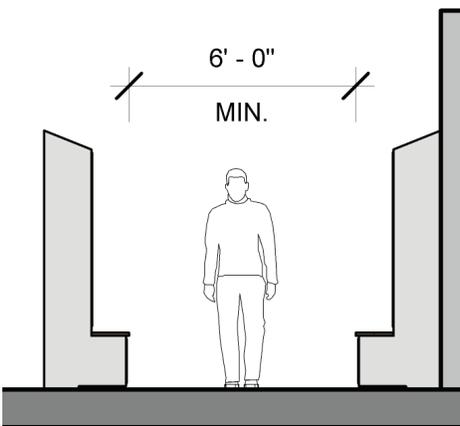

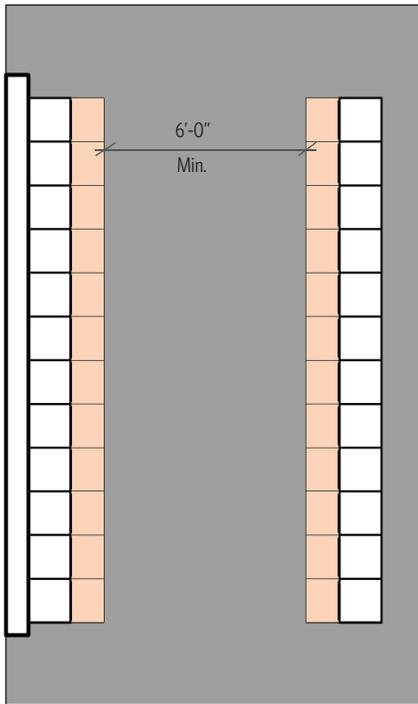

**EQUIPMENT/FURNISHINGS**

- Vendor provided well-ventilated uniform lockers, bin for dirty uniforms

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power: LED lighting in accordance with IES recommendation (15 fc average)
- Lighting: Dimmable, indirect lighting with occupancy sensor

**MEN'S AND WOMEN'S LOCKERS**

**FUNCTION**

Locker area for each male and female Bus Maintenance employees. Locker areas must be appropriately sized to meet the needs of Maintenance staff.

**RELATIONSHIP TO OTHER AREAS**

- Access by Repair and Shop Areas
- Located within each Men's and Women's Restrooms

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

**EQUIPMENT/FURNISHINGS**

- 6'-0" high gear, well-ventilated lockers with built-in bench
- Lockers must be ADA compliant and have mirrors
- Locker Dimensions: 24" by 24"
- Lockers to have sloped tops

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering or finished concrete (recommended)
  - ✓ Walls:
    - Tile covering or finished masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (15 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**COPY/SUPPLY**

**FUNCTION**

Dedicated alcove or room for copier/printer/scanner/fax machine, storage for office supplies, and with a work surface.

**RELATIONSHIP TO OTHER AREAS**

- Access to all office areas

**CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

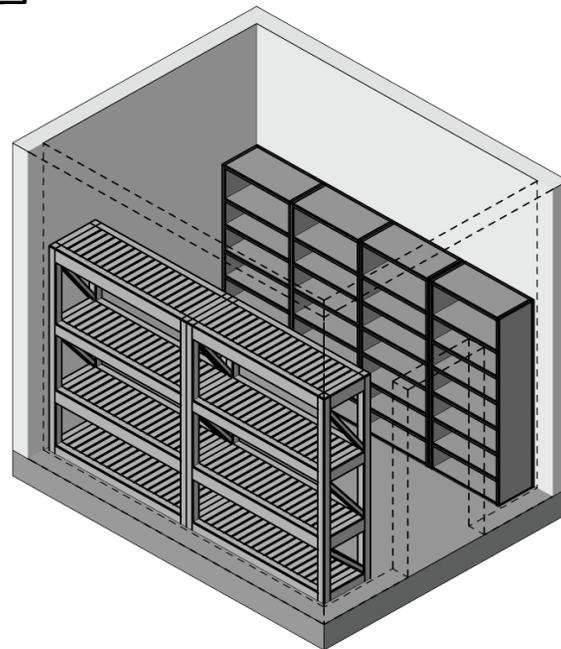

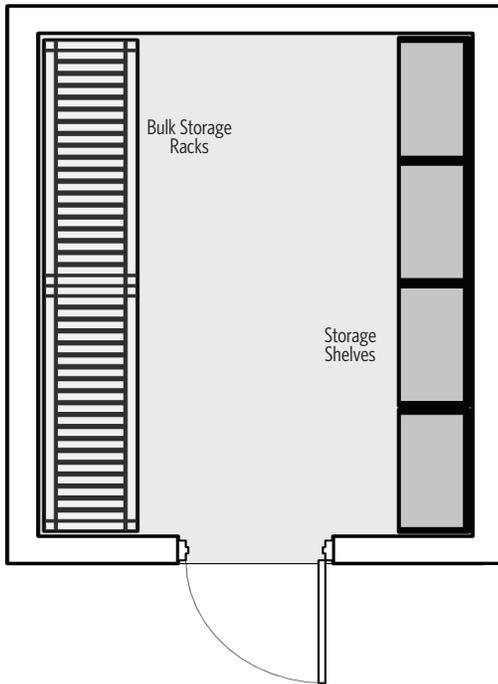

**EQUIPMENT/FURNISHINGS**

- Copier/printer/scanner/fax machine
- Millwork
- Work surface with cabinets below and above
- Filing cabinets

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide one data outlet with four data ports
  - ✓ Provide box conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**RECORDS STORAGE**

**FUNCTION**

Secure area for the long term storage of archived files and records.

**RELATIONSHIP TO OTHER AREAS**

- N/A

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

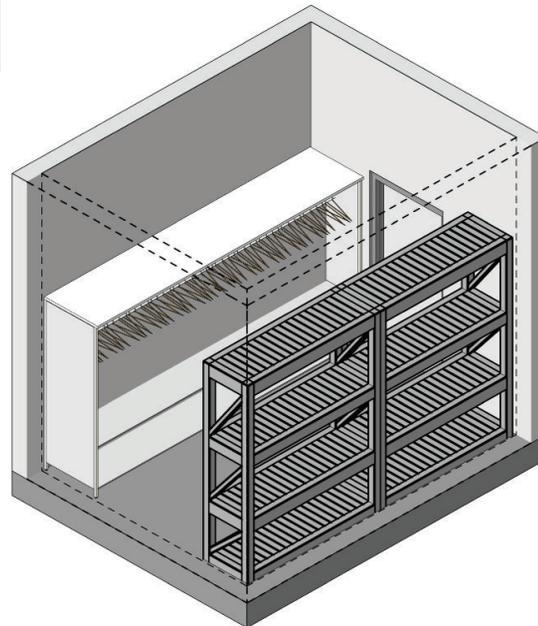

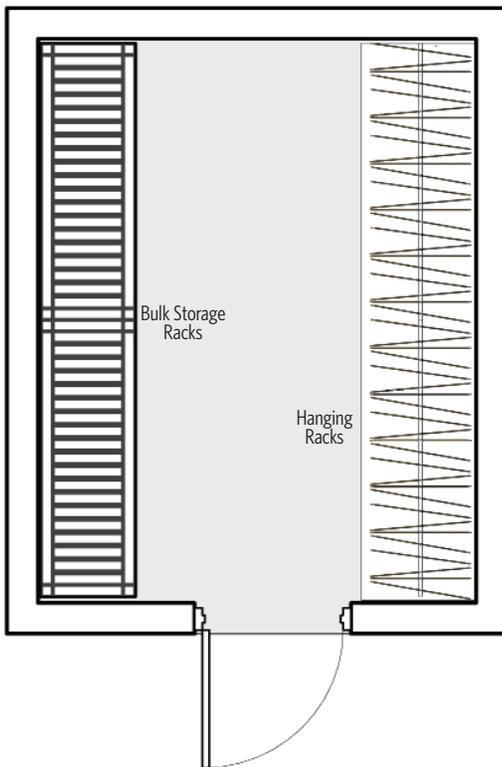

**EQUIPMENT/FURNISHINGS**

- Shelving
- Racking

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (30 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

**UNIFORM STORAGE**

**FUNCTION**

Enclosed room for storage of Operator uniforms.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Operator Check-in

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

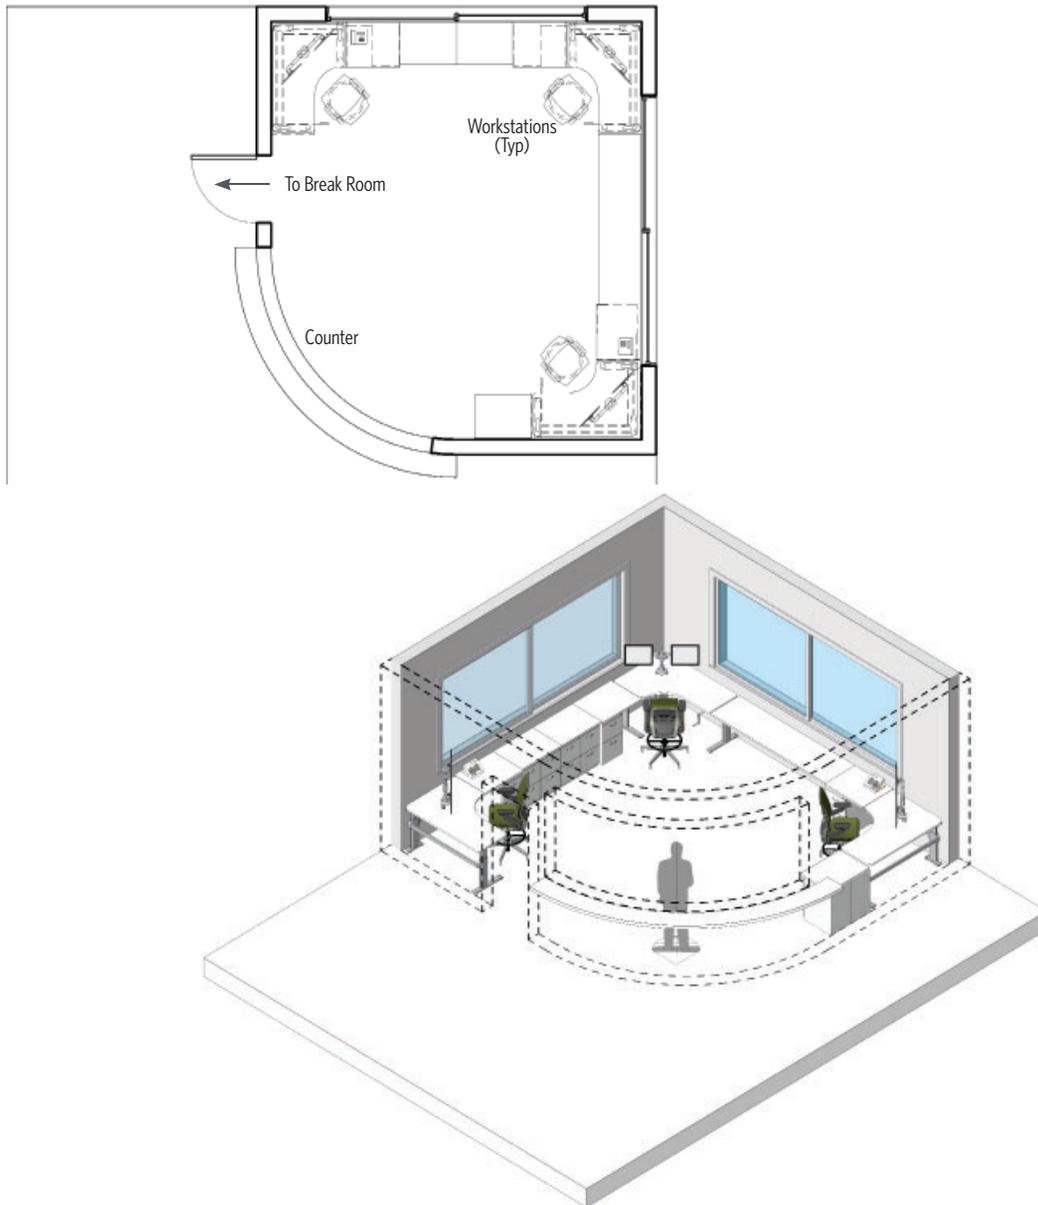

**EQUIPMENT/FURNISHINGS**

- Shelving
- Racking

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with loadable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED lighting in accordance with IES recommendation (15 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensor

**OPERATOR CHECK-IN/ DISPATCH/ RECEIVER**

**FUNCTION**

Area for Operators to report, receive information, and write reports.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Break Room
- Adjacent to Dispatch/Receiver

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

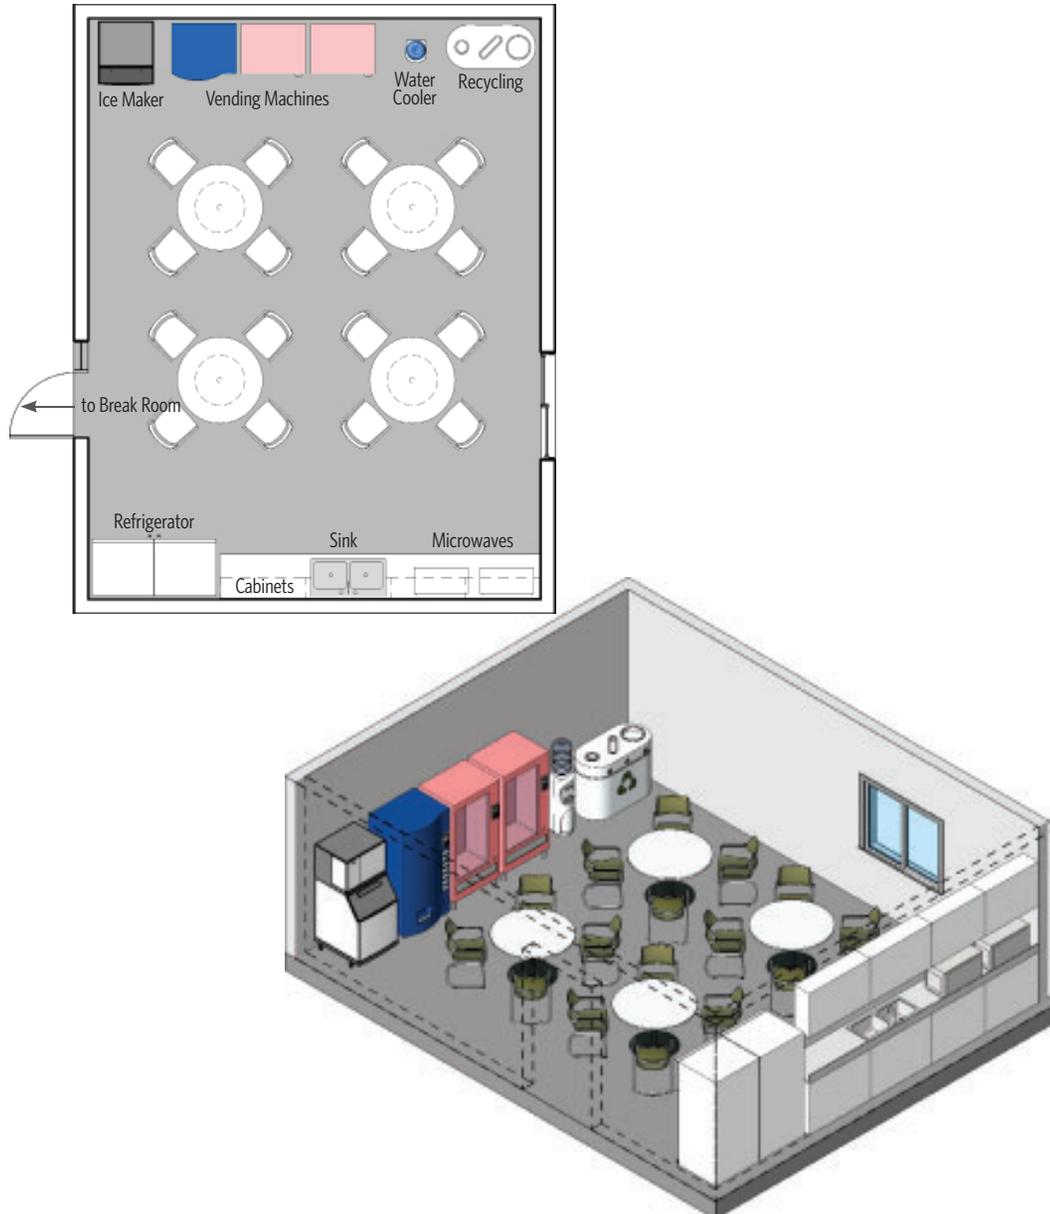

**EQUIPMENT/FURNISHINGS**

- Computer workstations
- Bulletin board
- Standing counter height, with portion of the counter at ADA accessible height

**DESIGN FEATURES**

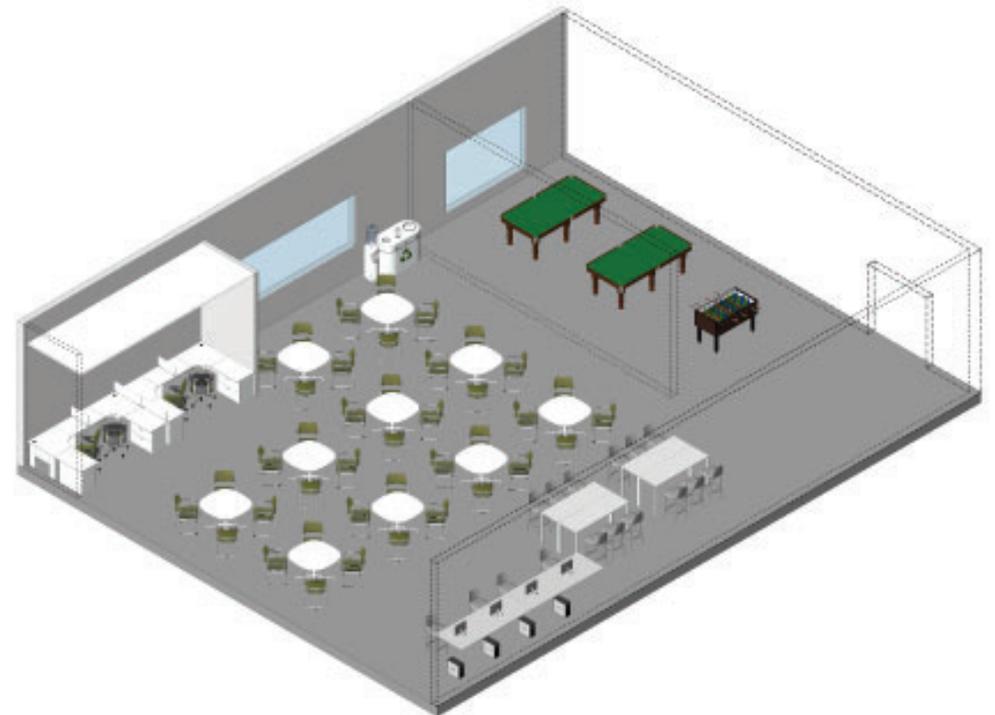

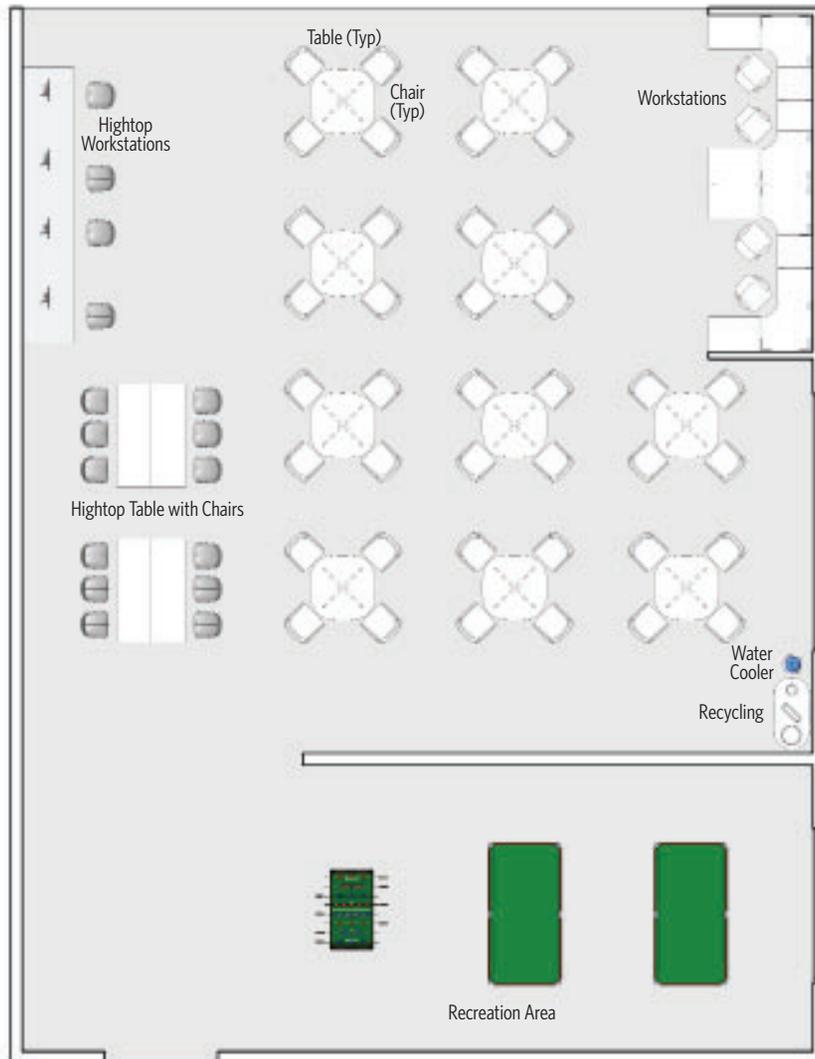

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED lighting in accordance with IES recommendation (20 fc of indirect lighting average, no glare)
  - ✓ Provide general purpose duplex receptacles (three minimum)
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and conduit rough-ins to three other locations in room
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**KITCHENETTE/VENDING**

FUNCTION
Area used for staff to eat, prepare, and store food.
RELATIONSHIP TO OTHER AREAS

BREAK ROOM/RECREATION AREA

**BREAK ROOM/RECREATION AREA**

**FUNCTION**

Area for Operators to gather, take breaks, and relax between shifts.

**RELATIONSHIP TO OTHER AREAS**

- Connected to Kitchenette/Vending
- Adjacent to:
  - ✓ TV Room
  - ✓ Quiet Room
  - ✓ Restrooms
  - ✓ Lockers
  - ✓ Mailboxes
  - ✓ Operator Check-In
  - ✓ Dispatch/Receiver

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

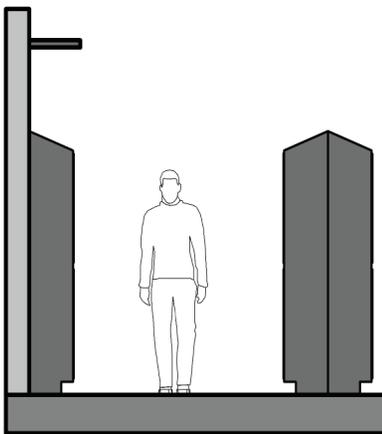

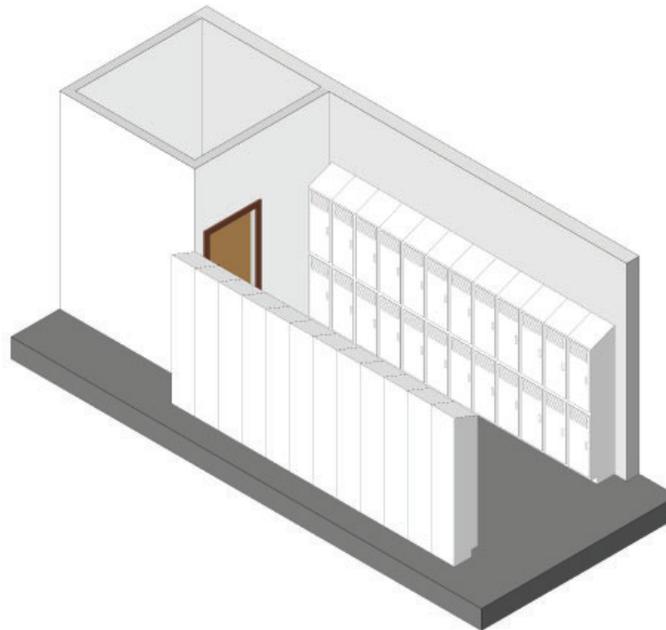

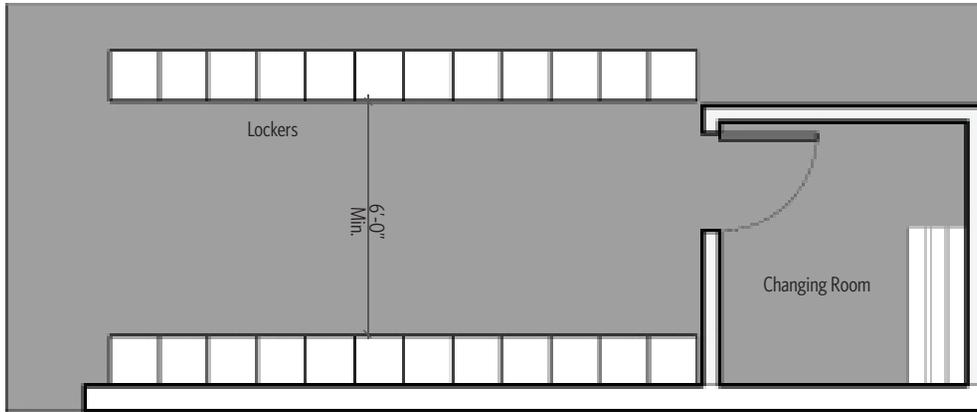

**EQUIPMENT/FURNISHINGS**

- Computer workstations
- Tables and chairs (no tables with attached chairs)
- Message and information televisions
- Chairs
- End tables
- Bulletin boards
- Recreation equipment
- Mailboxes
- Pool tables
- Alcove with workstation for incident reporting
- Millwork

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (30 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and conduit rough-ins to three other locations in room
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**LOCKERS**

**FUNCTION**

Co-ed locker room with alcove for Operators to store personal gear and clothing in half-height lockers (Single person occupancy private changing area within locker room and private changing areas in respective restrooms as well).

**RELATIONSHIP TO OTHER AREAS**

- Connected to Break Room
- Adjacent to Restroom/Showers

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

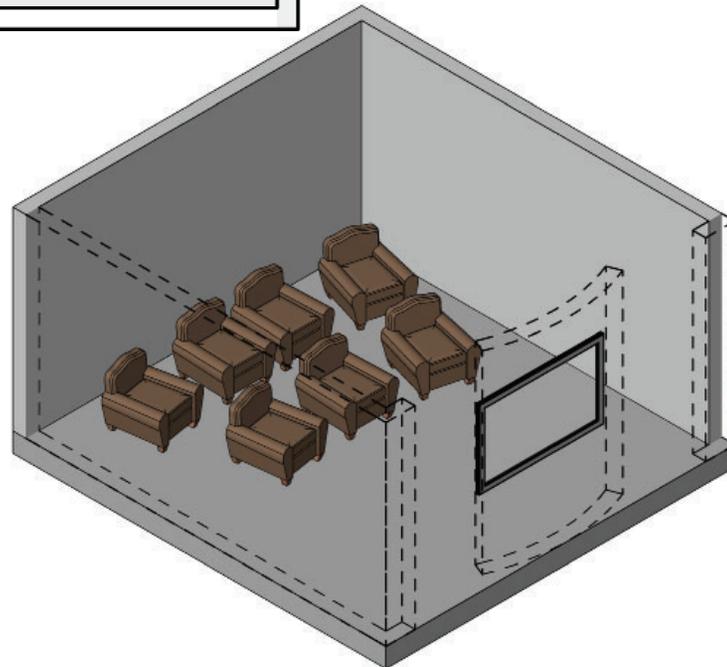

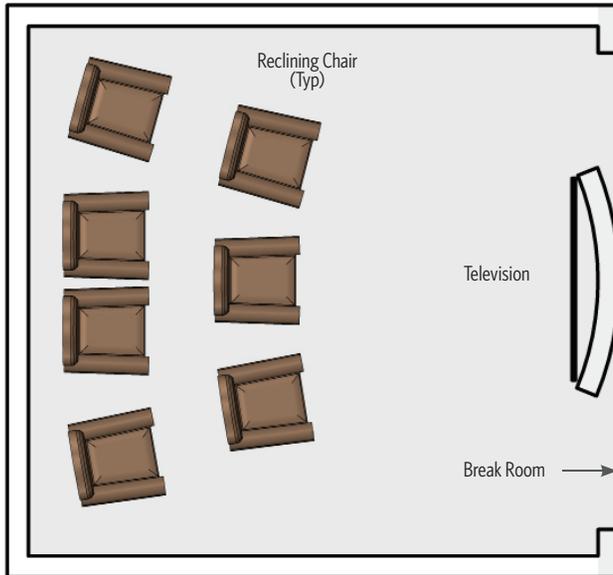

**EQUIPMENT/FURNISHINGS**

- Heavy duty, two tier, 3'-0", well-ventilated, half-height lockers; one each per Operator assigned to the facility
- Locker dimensions: 12" by 36"
- Lockers to have slant tops

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient covering or finished concrete (recommended)
  - ✓ Walls:
    - Tile covering or painted masonry (recommended)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

TV ROOM

FUNCTION

Enclosed room for Operators to watch television between, before, and after shifts.

RELATIONSHIP TO OTHER AREAS

- Adjacent to Break Room

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

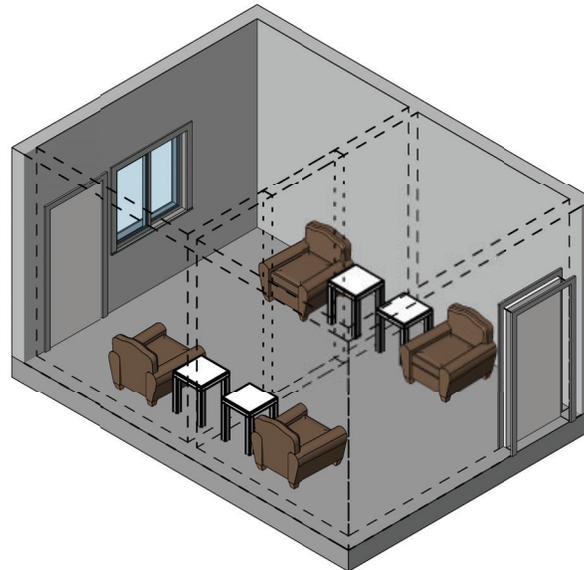

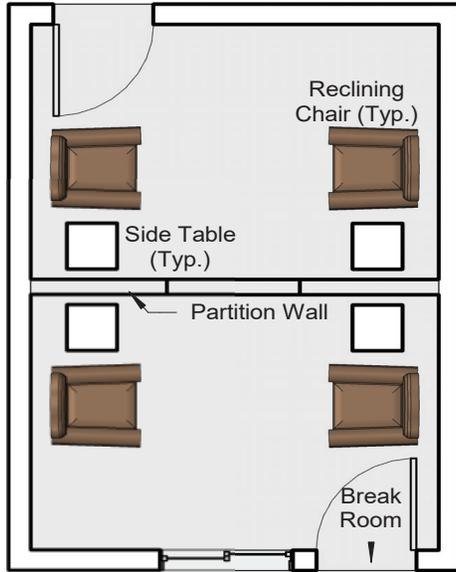

EQUIPMENT/FURNISHINGS

- Television
- Chairs
- End tables
- Table and chairs

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
- Daylighting: No exterior openings
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (15 fc indirect lighting average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide one data outlet with four data ports at back of TV
  - ✓ Provide coax cable to building MPOE
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**QUIET ROOM**

**FUNCTION**

Enclosed rooms for Operators to relax or sleep in a quiet environment between, before, and after shift.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Break Room

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

**EQUIPMENT/FURNISHINGS**

- Chairs
- Side tables

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors: Single leaf 3'-0" door
- Daylighting: No exterior openings
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc indirect lighting average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Plumbing: Rough in for equipment
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide data outlets with four data ports (two minimum)
  - ✓ Provide five GFCI outlets above kitchenette counter
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**LOCKERS**

**FUNCTION**

Locker area for each male and female Transit Services (MRO) employees. A few changing areas behind curtain or other partition will be provided.

**RELATIONSHIP TO OTHER AREAS**

- Access by Repair and Shop Areas
- Located within each Men's and Women's Restrooms

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

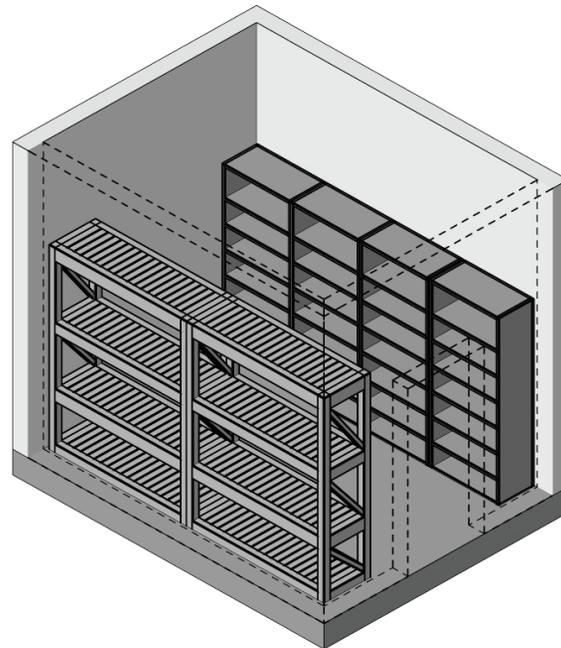

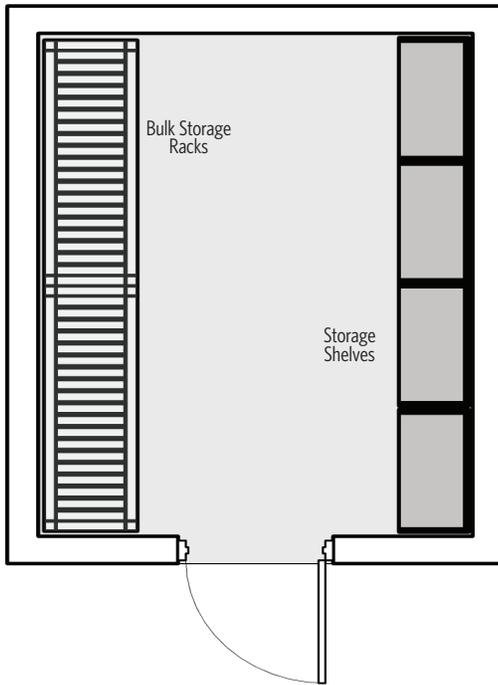

**EQUIPMENT/FURNISHINGS**

- 6'-0" high gear, well-ventilated lockers with built-in bench
- Lockers must be ADA compliant and have mirrors
- Locker Dimensions: 24" by 24"
- Lockers to have sloped tops

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering or finished concrete (recommended)
  - ✓ Walls:
    - Tile covering or finished masonry
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors: Single leaf 3'-0" door

    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" doors with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED lighting in accordance with IES recommendations (30 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of the table
  - ✓ Provide one data outlet with four data ports in the floor under the middle of the table
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

**FITNESS ROOM**

**FUNCTION**

Enclosed area with exercise equipment for employee fitness.

**RELATIONSHIP TO OTHER AREAS**

- Accessible from the Break Room, Lockers, and Restrooms and Showers

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

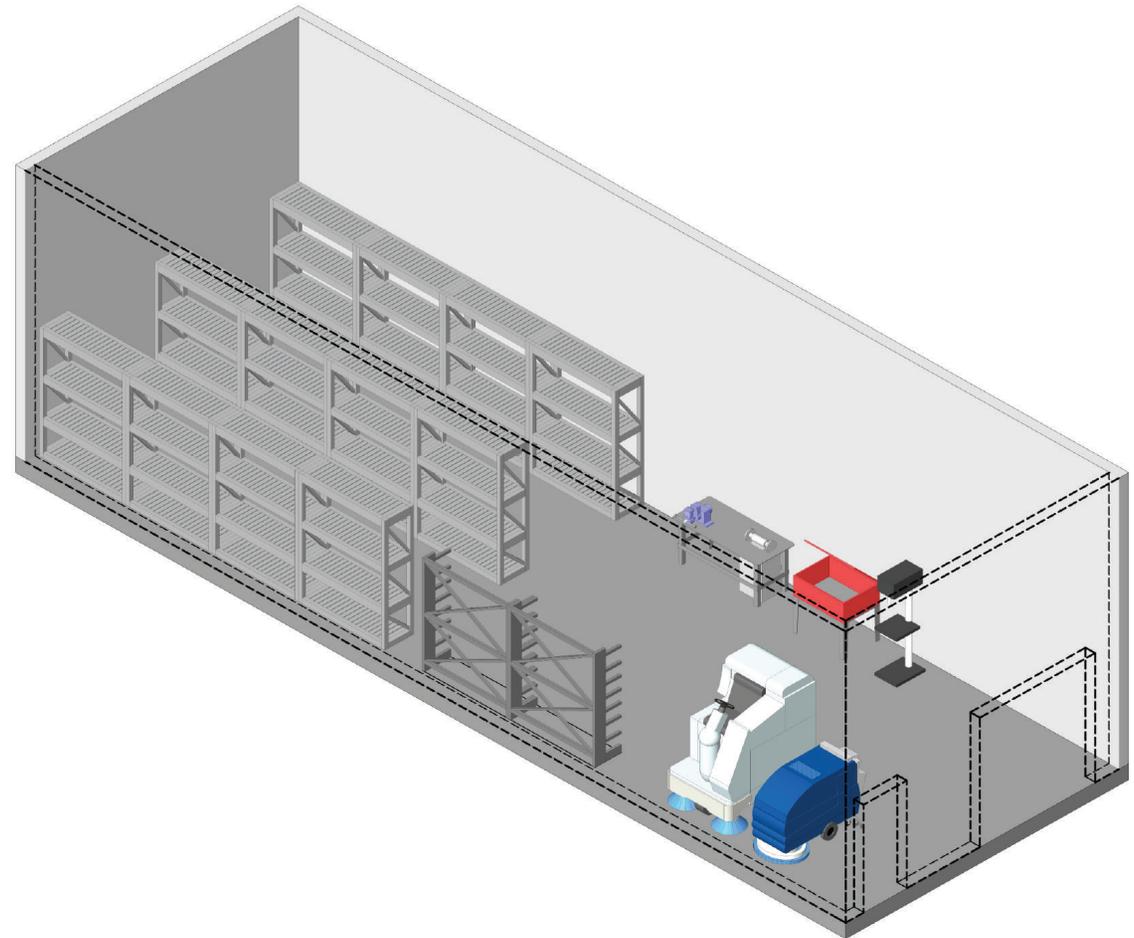

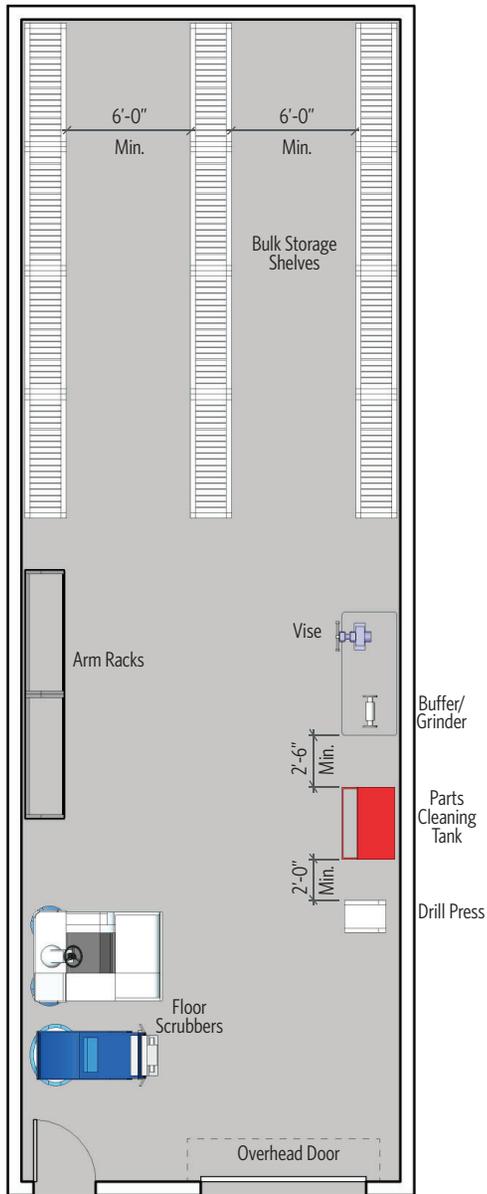

**EQUIPMENT/FURNISHINGS**

- Miscellaneous fitness equipment determined by the Owner
- Television

**DESIGN FEATURES**

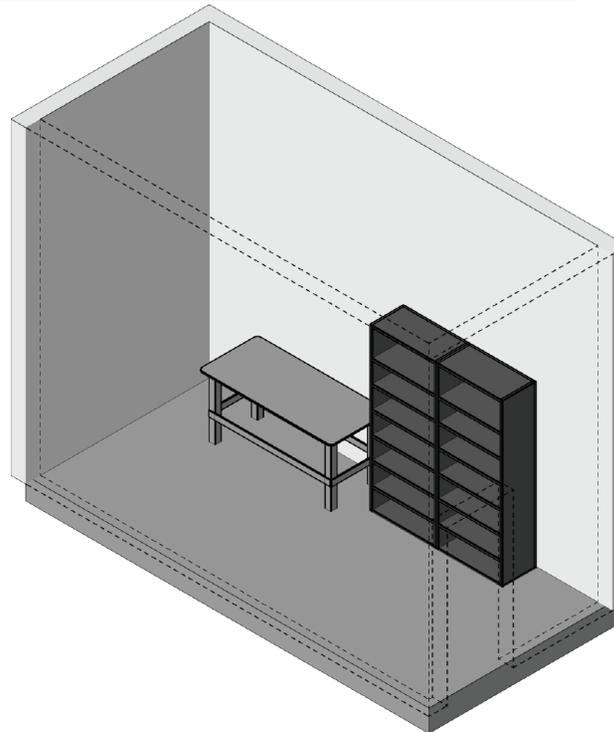

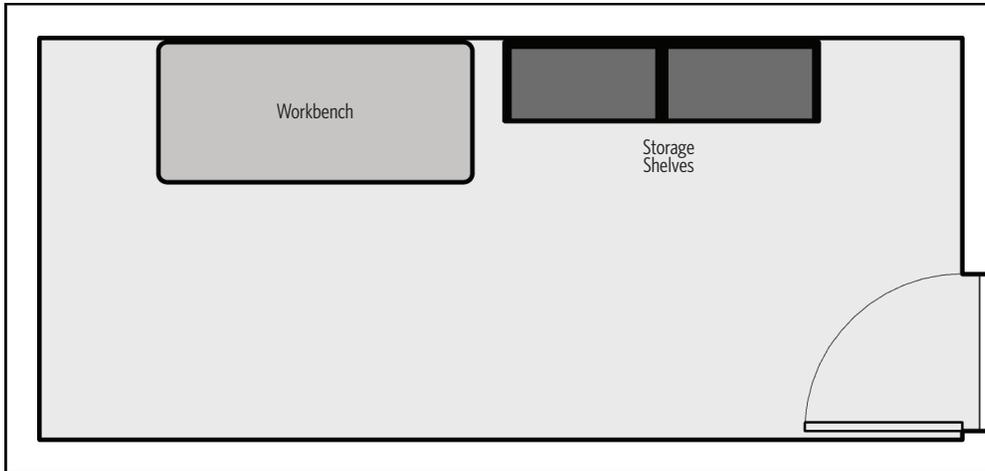

- Architectural:
  - ✓ Floor: Athletic rubber floor tiles with base (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors: Single leaf 3'-0" doors
- Daylighting: Exterior window desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (25 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

BUILDING ENGINEER/BUILDING STORAGE

BUILDING ENGINEER/BUILDING STORAGE		
<p><b>FUNCTION</b></p> <p>Enclosed, secure shop and materials storage and upkeep of materials related to maintenance buildings and site grounds.</p>	<p><b>ARCHITECTURAL CONSIDERATIONS</b></p> <ul style="list-style-type: none"> <li>• Finishes:                             <ul style="list-style-type: none"> <li>✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer</li> <li>✓ Walls: Soil and grease resistant, with light colored finish, made of concrete or masonry</li> <li>✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities, light colored finish</li> </ul> </li> <li>• Doors:                             <ul style="list-style-type: none"> <li>✓ Personnel door with view panel to meet applicable code exit requirements</li> <li>✓ Exterior overhead doors: High lifting sectional, steel, insulated, 10'-0" by 12'-0" with view panels. REVENUE OFFICE

FUNCTION

Secure area for storing specialized tools and equipment for fare retrieval, adaptable with space for workstation.

RELATIONSHIP TO OTHER AREAS

- Adjacent to Meet & Greet at entrance

CRITICAL DIMENSIONS

- 12'-0" vertical clearance to structure and fixtures

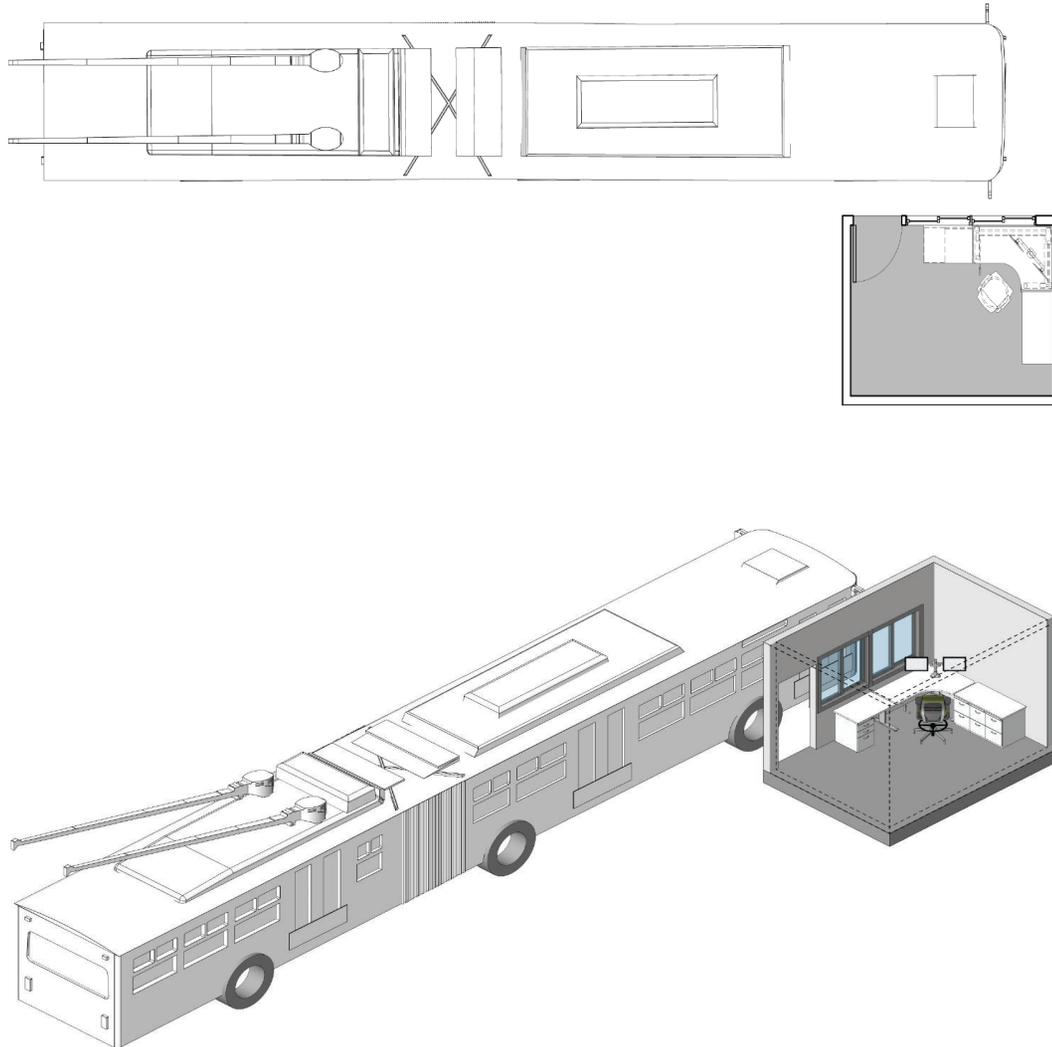

EQUIPMENT/FURNISHINGS

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities, with light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

**MEET & GREET**

**FUNCTION**

Space for buses to be greeted as they enter the facility.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to entrance of facility
- Buses will use circulation aisle to access Meet & Greet

**CRITICAL DIMENSIONS**

- 19'-0" vertical clearance (minimum)

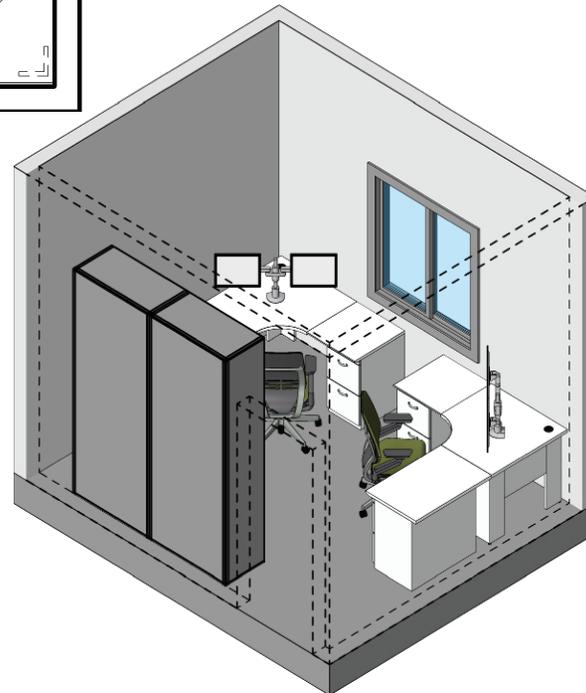

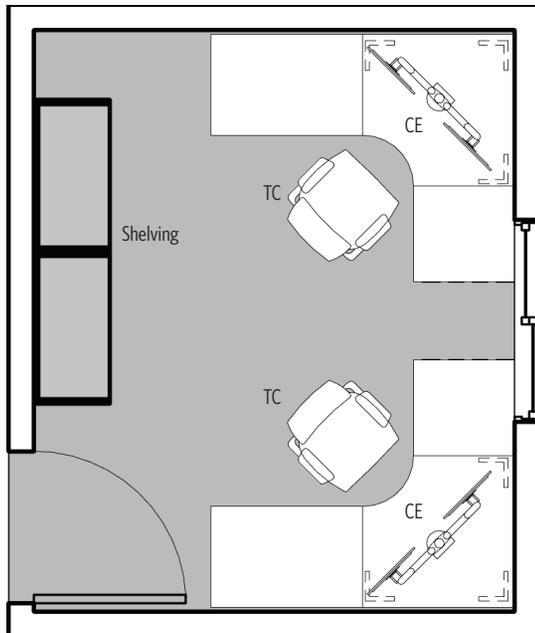

**EQUIPMENT/FURNISHINGS**

- Task chair
- Sit/stand workstation
- Under surface vertical files
- Cabinets
- Guest chairs

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for Administration or Operations areas (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas (recommended).
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with loadable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (35 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

SECURITY OFFICE

FUNCTION

Office for security staff to monitor facility.

RELATIONSHIP TO OTHER AREAS

- Case specific (office areas specific to each group); reference general module

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

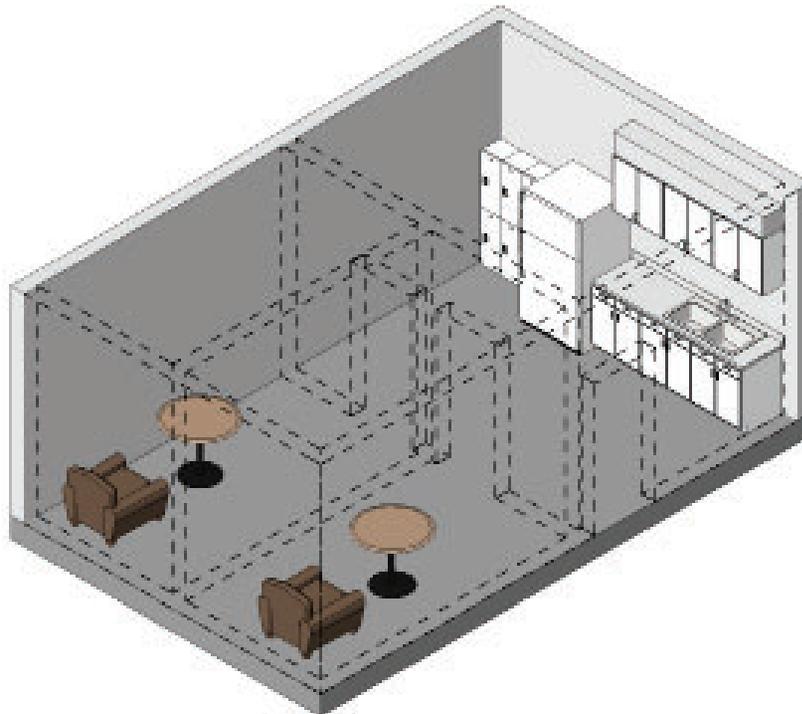

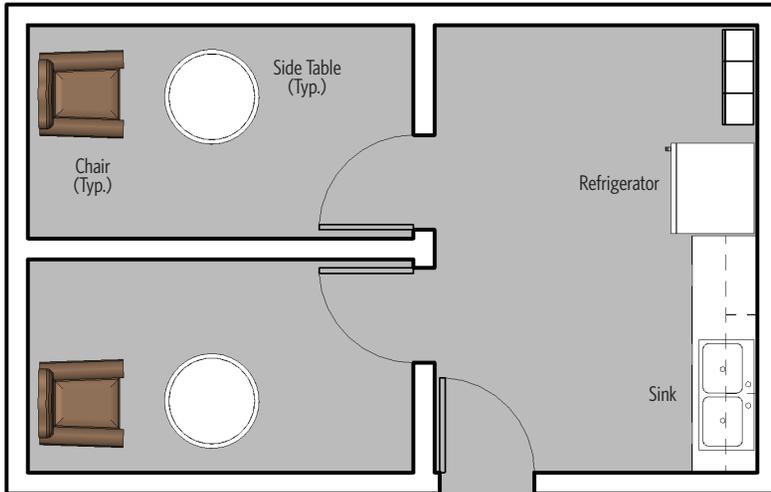

EQUIPMENT/FURNISHINGS

- Task chair
- Sit/stand workstation
- Under surface vertical files
- Cabinets
- Guest chairs

DESIGN FEATURES

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring:
    - Carpet tile floor with rubber base for Administration or Operations areas (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
    - Resilient floor covering with base for maintenance areas (recommended).
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with loadable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (35 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

LACTATION ROOM

FUNCTION

Dedicated room for employees who are breastfeeding to pump breast milk in private.

RELATIONSHIP TO OTHER AREAS

- Accessible from department office areas

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

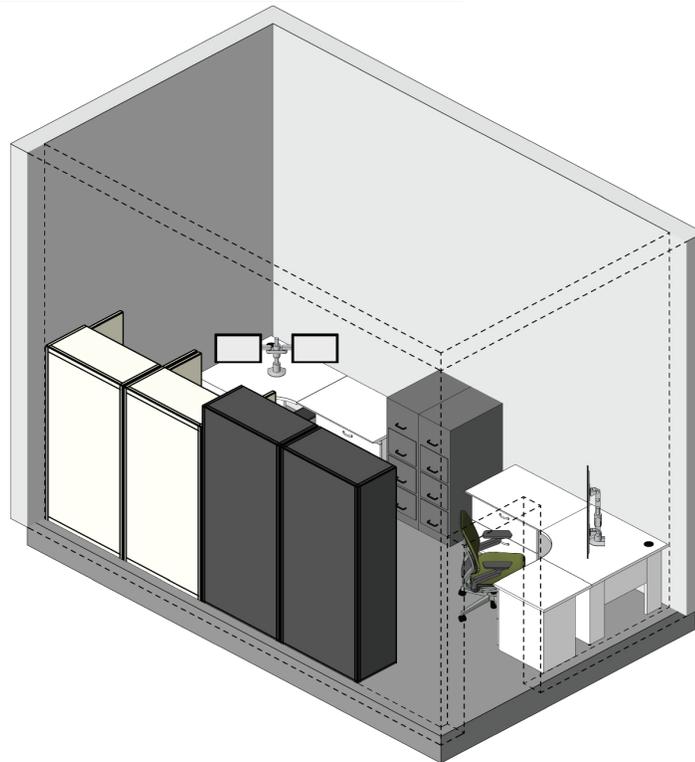

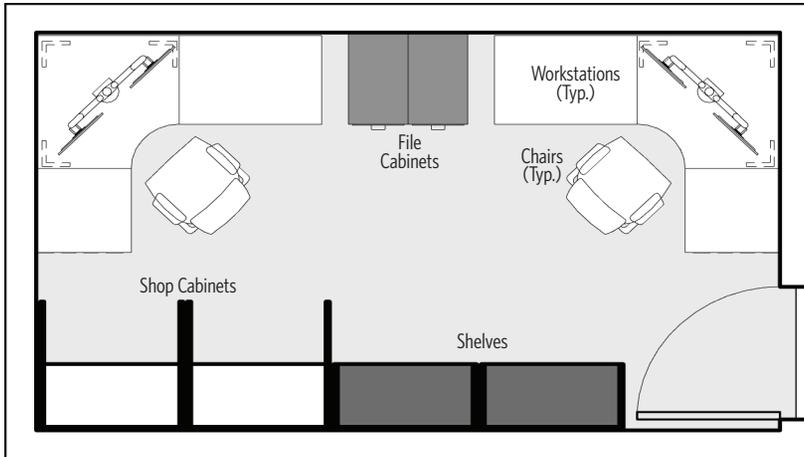

EQUIPMENT/FURNISHINGS

- Sink with countertops and cabinets
- Secure storage for equipment and supplies
- Lockers
- Side tables
- Refrigerator
- Chairs
- Door with interior lock

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf lockable 3'-0" door with loadable lever set hardware (recommended)
    - Electronically secured entry
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Plumbing: rough-in for fixtures
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc indirect lighting average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
  - ✓ Provide one GFCI outlet above counter
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

FACILITIES STATIONARY ENGINEER OFFICE/SHOP

FUNCTION

Workstations, Shop and Storage for Facilities Stationary Engineering staff.

RELATIONSHIP TO OTHER AREAS

- Access to Parts Window/Shopkeeper/Parts Storage/ Shipping and Receiving/ Dock

CRITICAL DIMENSIONS

- 12'-0" vertical clearance to structure and fixtures

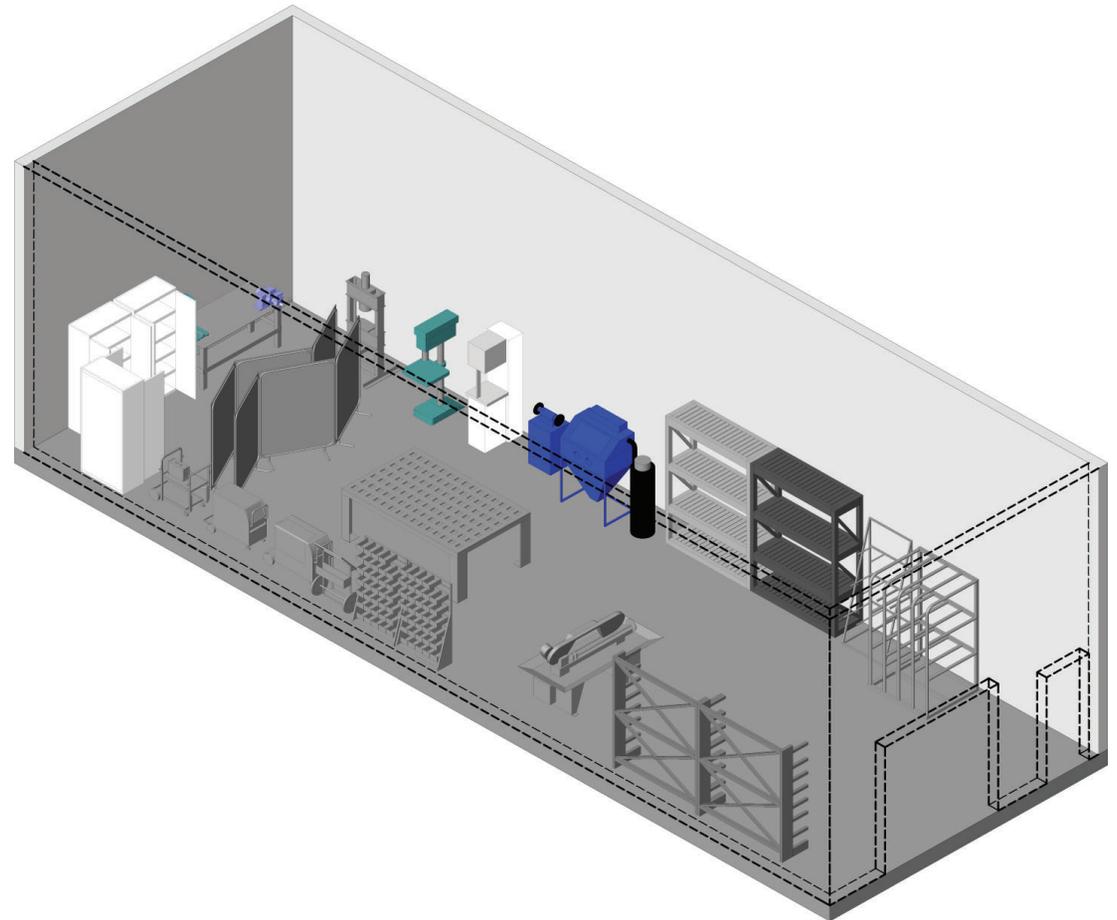

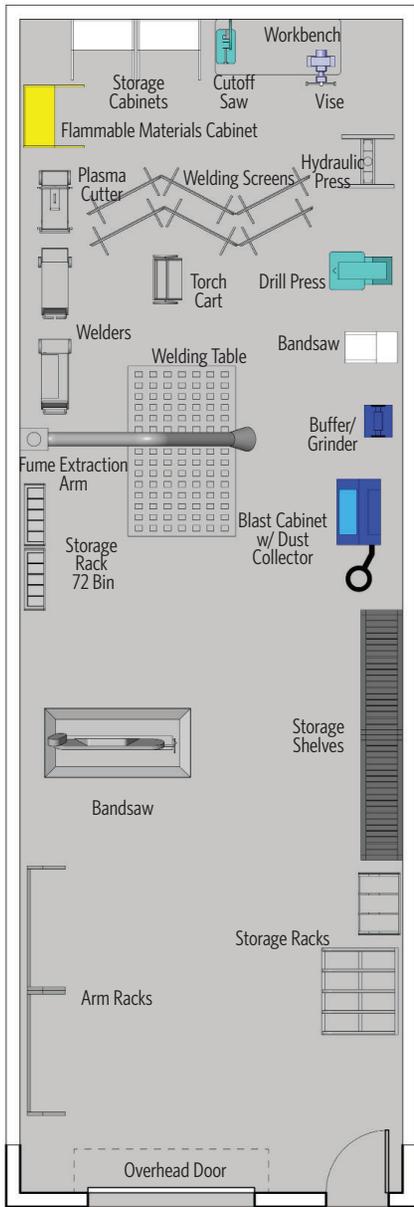

EQUIPMENT/FURNISHINGS

- Typical equipment is shown, reference Appendix A: Equipment Manual for specific project equipment

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Soil, grease, water, slip resistant concrete, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
  - ✓ Doors: Personnel door with view panels to meet applicable code exit requirements (not required with wire mesh walls)
- Structural:
  - ✓ Control joints in floor slab at adequate spacing
  - ✓ Floor slab to accommodate in-floor radiant heat (if desired)
  - ✓ Structure as needed to support equipment
  - ✓ Floor slab designed to accommodate forklift access
- Mechanical:
  - ✓ In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ As required by equipment
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting: LED lighting in accordance with IES recommendation minimum (20 fc average)

SHEET METAL SHOP

**SHEET METAL SHOP**

**FUNCTION**

Enclosed, secure shop and materials storage for metal fabrication.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to bus maintenance areas

**CRITICAL DIMENSIONS**

- 14'-0" vertical clearance to structure and clearance

**EQUIPMENT/FURNISHINGS**

- Reference Equipment Manual

**DESIGN FEATURES**

- Forklift access
- Electronically secured entry

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral, non-metallic, light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, with light colored finish, made of concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit, and utilities, light colored finish
- Doors:
  - ✓ Personnel door with view panel to meet applicable code exit requirements
  - ✓ Exterior overhead doors: High lifting sectional, steel, insulated, 10'-0" by 12'-0" with view panels. Automatic operator, interior and exterior push button controls with lockout on exterior
  - ✓ Bollards on exterior at jambs of overhead door (two each)

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)

**MECHANICAL CONSIDERATIONS**

- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- In-floor radiant heat (if desired)
- As required by equipment

**PLUMBING CONSIDERATIONS**

- Compressed air drop:
  - ✓ 2'-0" compressed air piping loop (minimum)
  - ✓ Compressed air drops with shut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles (ten minimum) on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Lighting:
  - ✓ LED lighting in accordance with IES recommendation minimum (20 fc average)
  - ✓ Fixtures located to illuminate work spaces
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

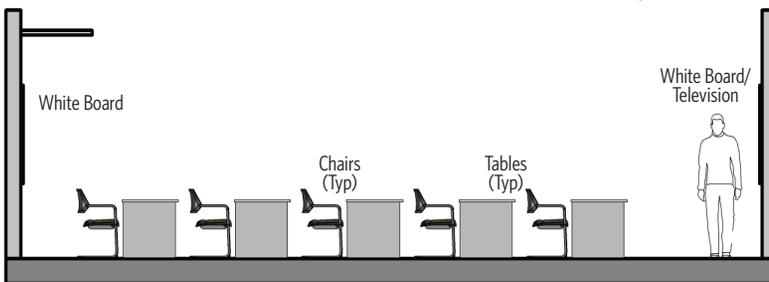

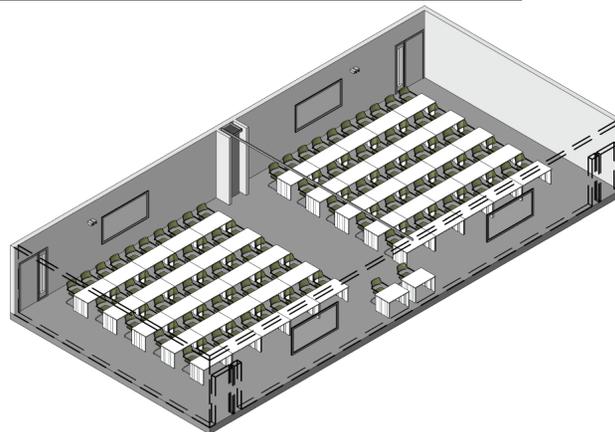

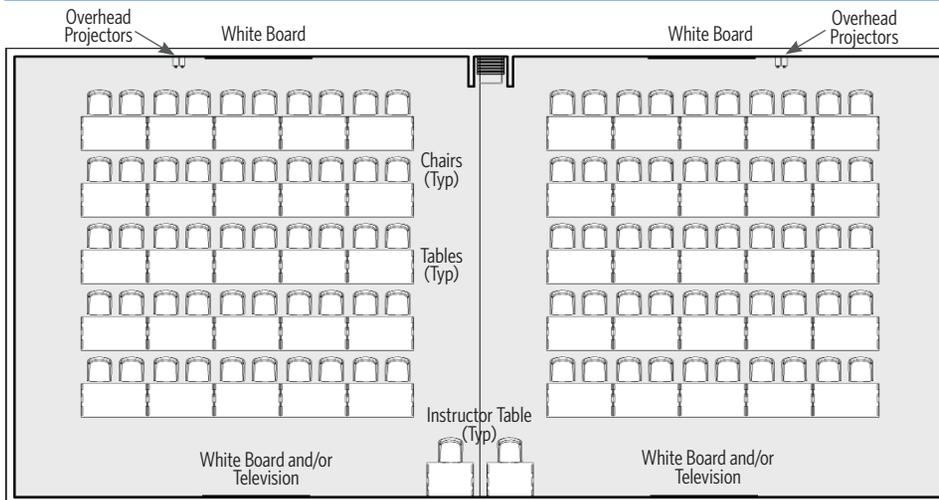

## SECTION 5.11: TRAINING

GENERAL OFFICE MODULES

<p><b>MANAGER</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Private Office - 224 sf</b></li> <li>• Adjacent to Superintendent</li> <li>• Adjacent to Assistant Superintendent</li> </ul>	<p><b>SUPERINTENDENT</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Private Office - 224 sf</b></li> <li>• Adjacent to Manager</li> <li>• Adjacent to Assistant Superintendent</li> </ul>	<p><b>ASSISTANT SUPERINTENDENT</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Private Office - 120 sf</b></li> <li>• Adjacent to Manager</li> <li>• Adjacent to Superintendent</li> </ul>	<p><b>SUPERVISOR</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Workstation - 64 sf</b></li> <li>• Adjacent to Verification of Transit Training</li> <li>• Adjacent to Instructors</li> </ul>
<p><b>CLERICAL STAFF</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Workstation - 64 sf</b></li> <li>• Adjacent to Team Leaders</li> </ul>	<p><b>TEAM LEADERS</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Workstation - 64 sf</b></li> <li>• Adjacent to Clerical Staff</li> </ul>	<p><b>CAT TRAINING</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Workstation - 64 sf</b></li> <li>• Adjacent to Supervisors</li> </ul>	<p><b>INSTRUCTORS</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Workstation - 30 sf</b></li> <li>• Adjacent to Training Room</li> <li>• Adjacent to Classroom</li> </ul>
<p><b>IT OFFICE</b></p> <ul style="list-style-type: none"> <li>• Reference <b>Office Module Private Office - 120 sf</b></li> <li>• Adjacent to Computer Lab</li> </ul>			

**CLASSROOM A & B**

**FUNCTION**

Large room(s) for staff training activities. Each space shall accommodate 50 students separately, 100 when combined. Classrooms A & B can be divided or joined via folding partition wall.

**RELATIONSHIP TO OTHER AREAS**

- Accessible to all departments in the building
- Adjacent to Training Office area

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

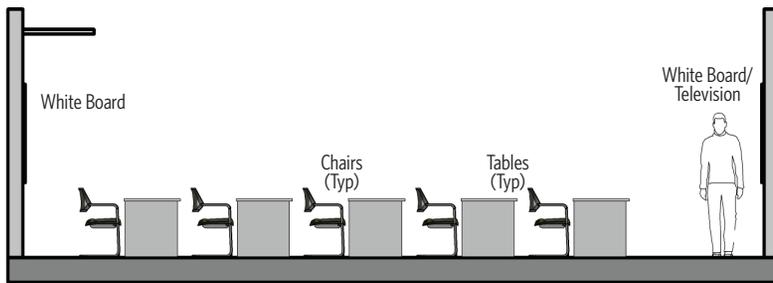

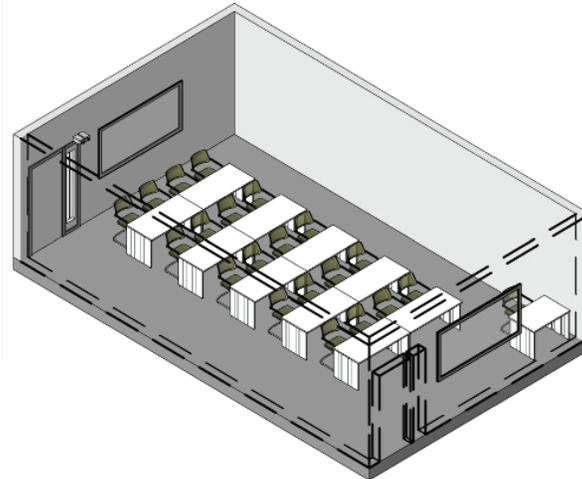

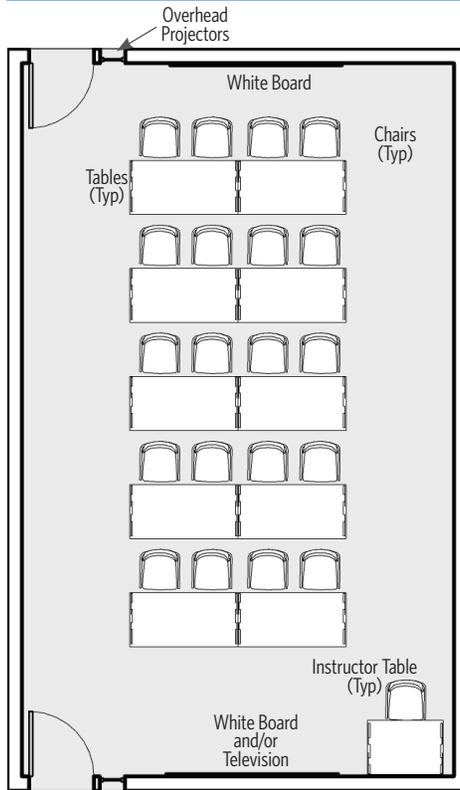

**EQUIPMENT/FURNISHINGS**

- Mayline Cohere Flip/nest table 60" by 30" laminate
- Cool mesh nesting chairs
- Whiteboard and/or television
- Overhead projectors

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Power:
  - ✓ LED lighting in accordance with IES recommendations (35 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of the table
  - ✓ Provide one data outlet with four data ports in the floor under the middle of the table
  - ✓ Provide box and one inch or larger conduit rough-ins every ten feet in all walls in room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

CLASSROOM C & D

FUNCTION

Room(s) for staff training. This space accommodates 20 students and one instructor.

RELATIONSHIP TO OTHER AREAS

- Accessible to all departments in the building
- Adjacent to Training Office area

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

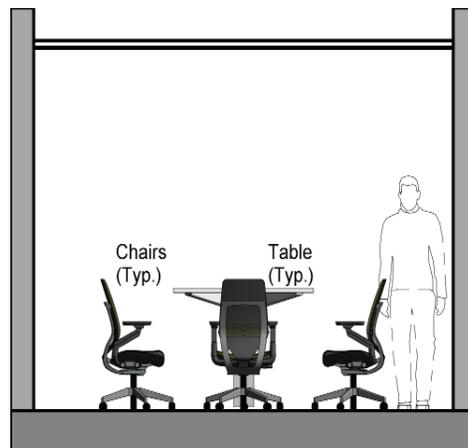

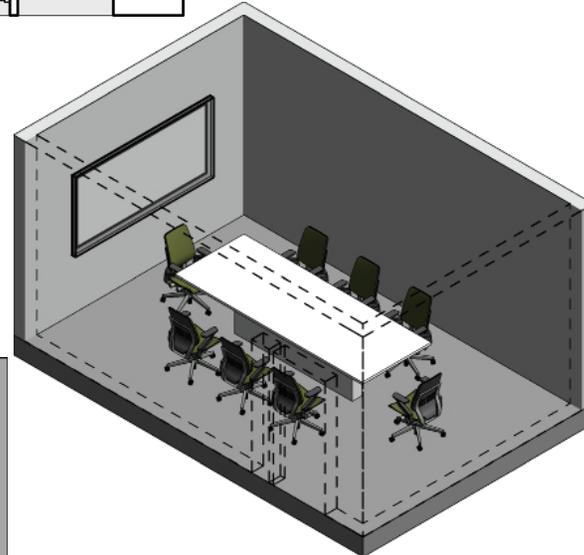

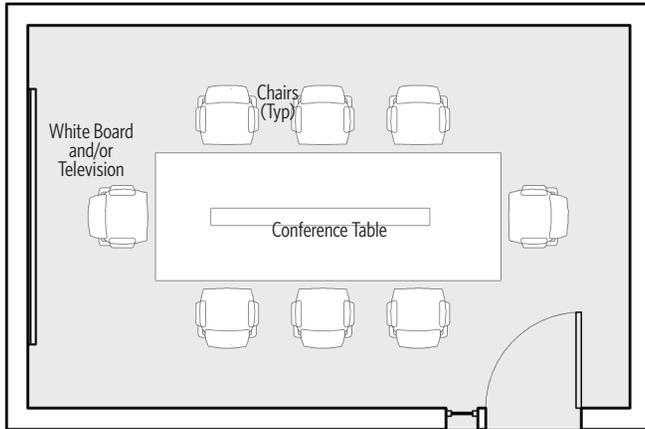

EQUIPMENT/FURNISHINGS

- Mayline Cohere Flip/nest table 60"
- Cool mesh nesting chairs
- Whiteboard and/or television by 30" laminate
- Overhead projector

DESIGN FEATURES

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Power:
  - ✓ LED lighting in accordance with IES recommendations (35 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of the table
  - ✓ Provide one data outlet with four data ports in the floor under the middle of the table
  - ✓ Provide box and one inch or larger conduit rough-ins every ten feet in all walls in room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

CONFERENCE ROOM A & B

FUNCTION

Room to accommodate up to 10 people for meetings.

RELATIONSHIP TO OTHER AREAS

- Accessible from all departments in the building

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

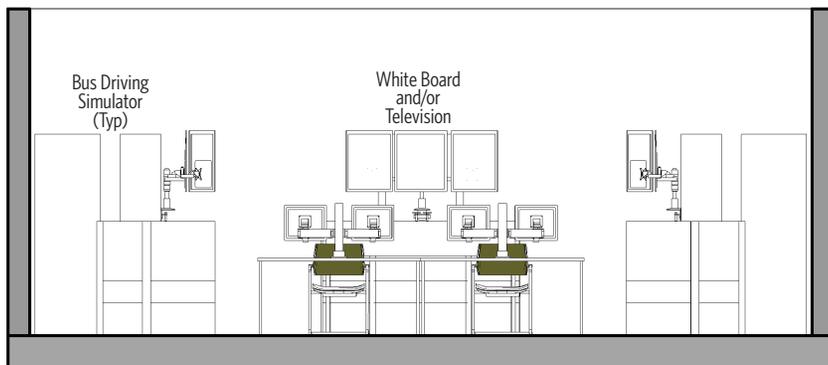

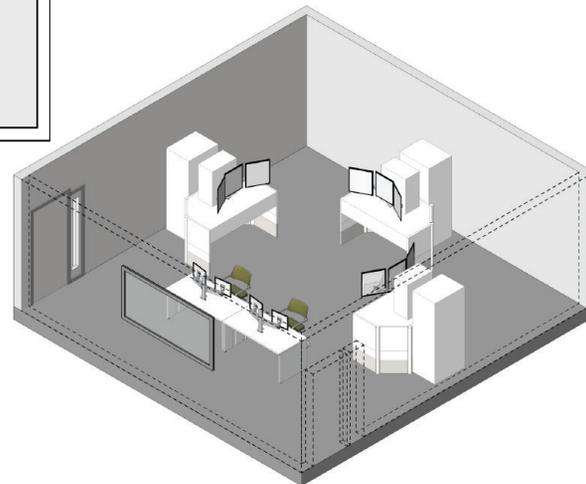

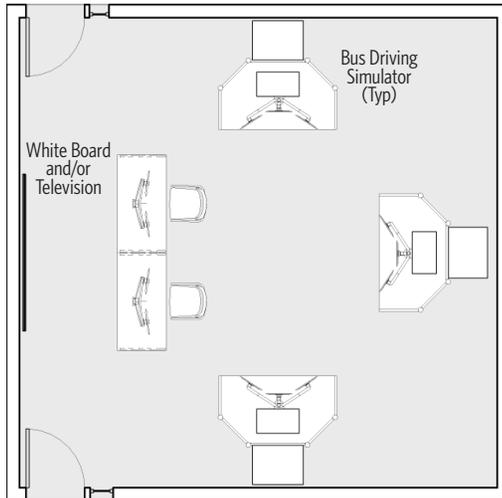

EQUIPMENT/FURNISHINGS

- Table
- Chairs
- White board and/or television
- Millwork

DESIGN FEATURES

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED lighting in accordance with IES recommendations (30 fc average)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of the table
  - ✓ Provide one data outlet with four data ports in the floor under the middle of the table
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

**SIMULATOR ROOM**

**FUNCTION**

Room for computer-based simulator training for staff.

**RELATIONSHIP TO OTHER AREAS**

- Accessible to all departments in the building
- Adjacent to Training Office area

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

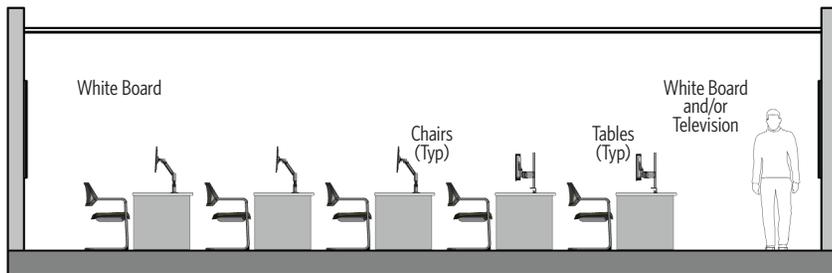

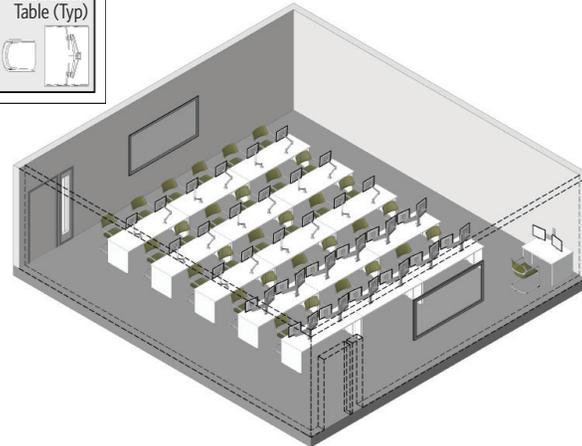

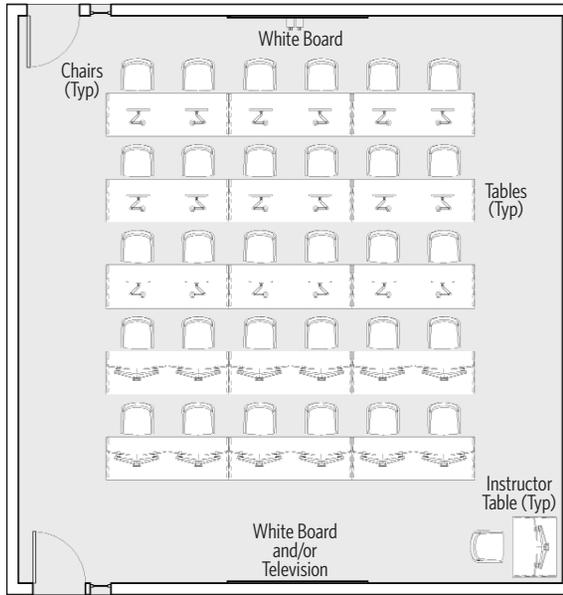

**EQUIPMENT/FURNISHINGS**

- Simulators
- Whiteboard and/or television

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED lighting in accordance with IES recommendations. (20 fc indirect lighting average) (no glare)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of the table
  - ✓ Provide one data outlet with four data ports in the floor under the middle of the table
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

COMPUTER LAB

FUNCTION

Room for computer-based training activities.

RELATIONSHIP TO OTHER AREAS

- Accessible from all departments in the building
- Adjacent to Training Office areas

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

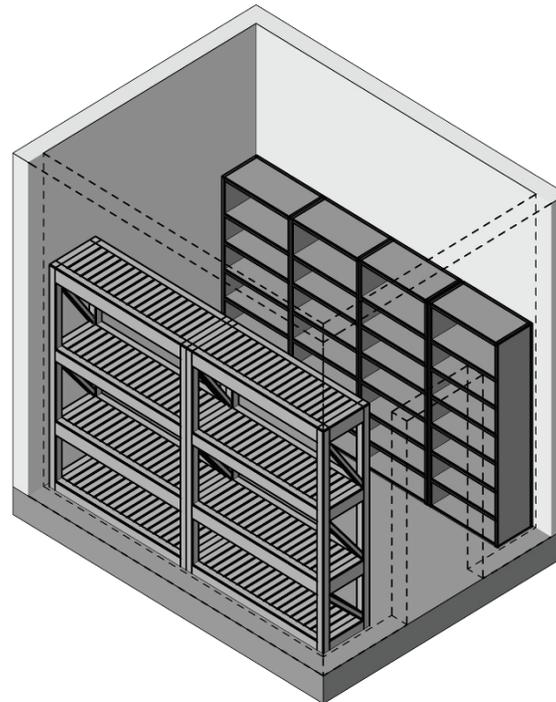

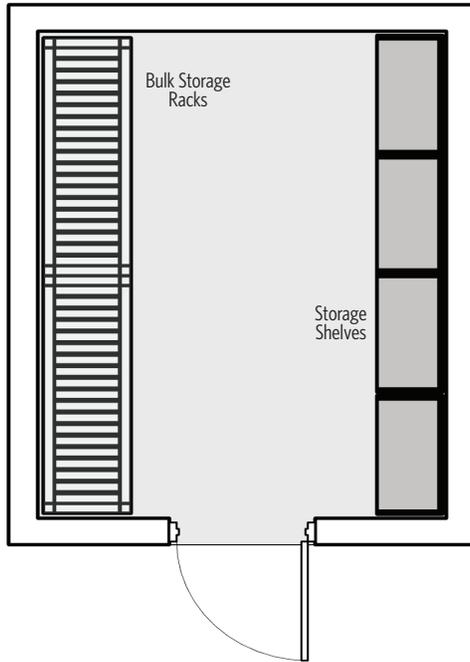

EQUIPMENT/FURNISHINGS

- Mayline Cohere Flip/nest table 60" by 30" laminate
- Cool mesh nesting chairs
- Whiteboard and/or television
- Computers
- Overhead projector

DESIGN FEATURES

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Carpet tile floor with rubber base or resilient floor covering with base (recommended). Carpet tile must comply with the specifications developed by the San Francisco Department of the Environment, dated June 8, 2018
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Power:
  - ✓ LED lighting in accordance with IES recommendations. (20 fc indirect lighting average) (no glare)
  - ✓ Provide general purpose duplex receptacles (four minimum) and a guard receptacle in the floor under the middle of each of the tables
  - ✓ Provide one data outlet with four data ports in the floor under the middle of each table
  - ✓ Provide box and one inch or larger conduit rough-ins every ten feet in all walls in room
- Lighting:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

**HANDOUTS STORAGE**

**FUNCTION**

Secure room for storage of training handout materials and supplies.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Classroom and Computer Lab

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

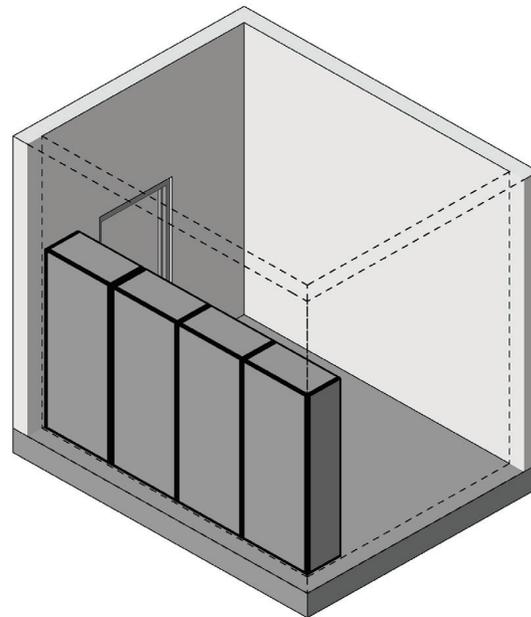

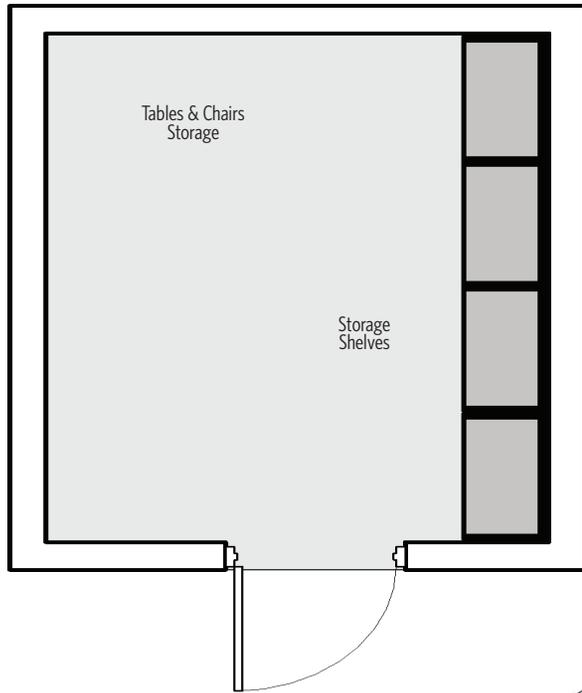

**EQUIPMENT/FURNISHINGS**

- Shelving
- Racking

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

TRAINING AID STORAGE

FUNCTION

Secure room for storage of training aid materials and supplies.

RELATIONSHIP TO OTHER AREAS

- Adjacent to Classroom and Computer Lab

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

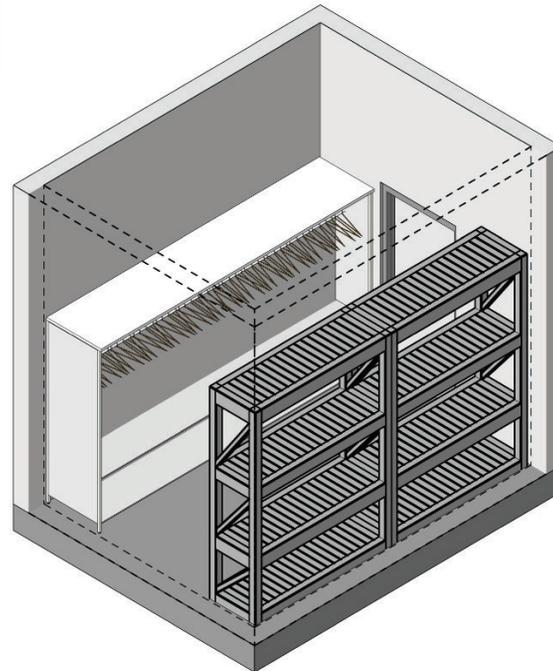

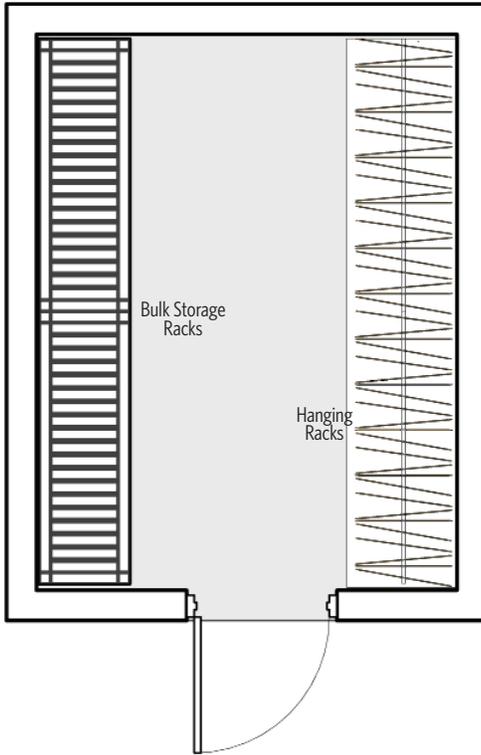

EQUIPMENT/FURNISHINGS

- Shelves
- Includes Tables and Chairs storage (as needed)

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 4'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

UNIFORM STORAGE

FUNCTION

Enclosed room for storage of operator uniforms and safety attire.

RELATIONSHIP TO OTHER AREAS

- Adjacent to Training Office areas

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

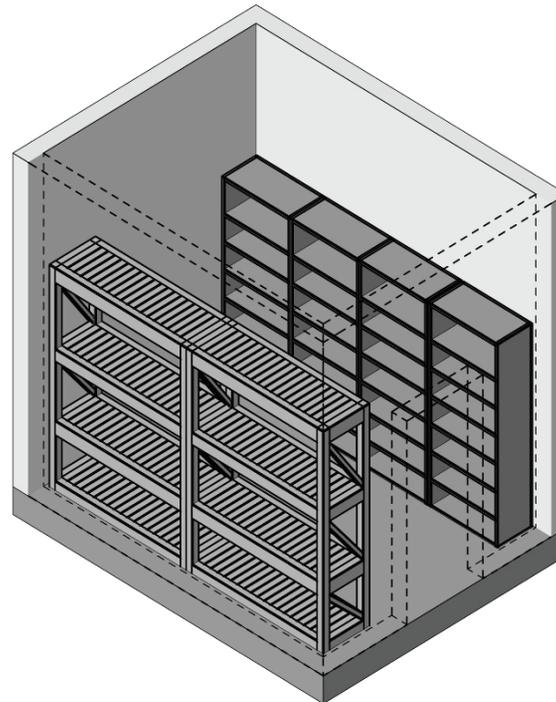

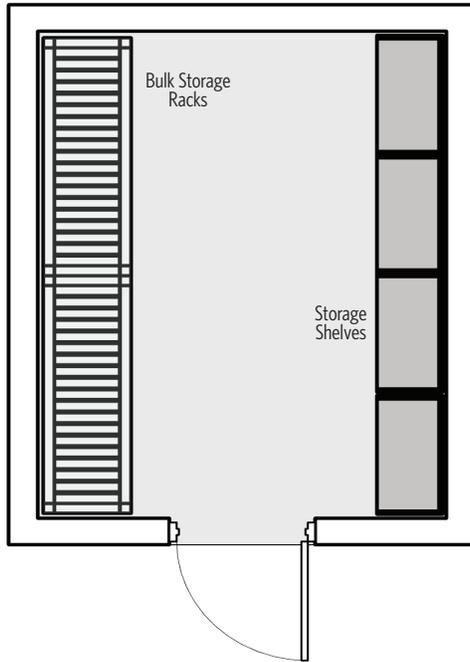

EQUIPMENT/FURNISHINGS

- Hanging racks
- Bulk storage racks

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with loadable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED lighting in accordance with IES recommendation (15 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensor

RECORDS STORAGE

FUNCTION

Secure area for the storage of files and records.

RELATIONSHIP TO OTHER AREAS

- N/A

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

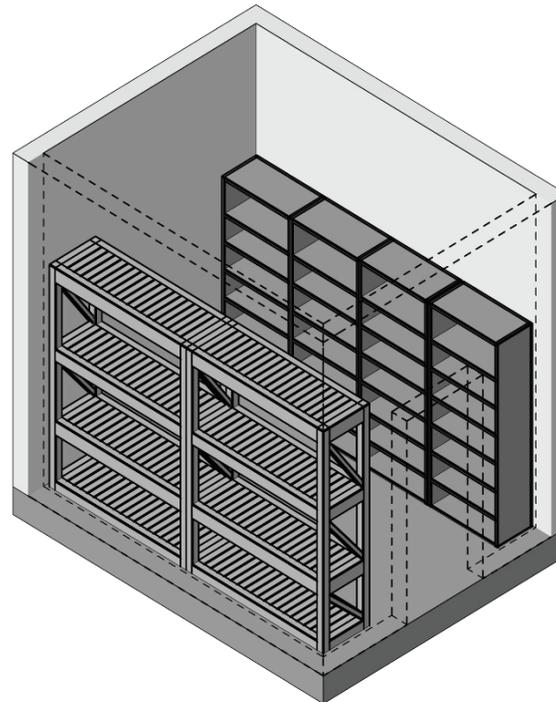

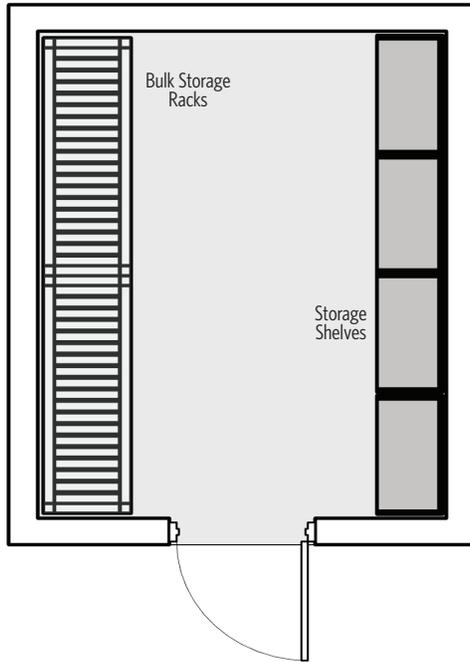

EQUIPMENT/FURNISHINGS

- Shelving
- Racking

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Plumbing: Rough in for equipment
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (35 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

RECORDS ARCHIVE STORAGE

FUNCTION

Secure area for the long term storage of archived files and records.

RELATIONSHIP TO OTHER AREAS

- N/A

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

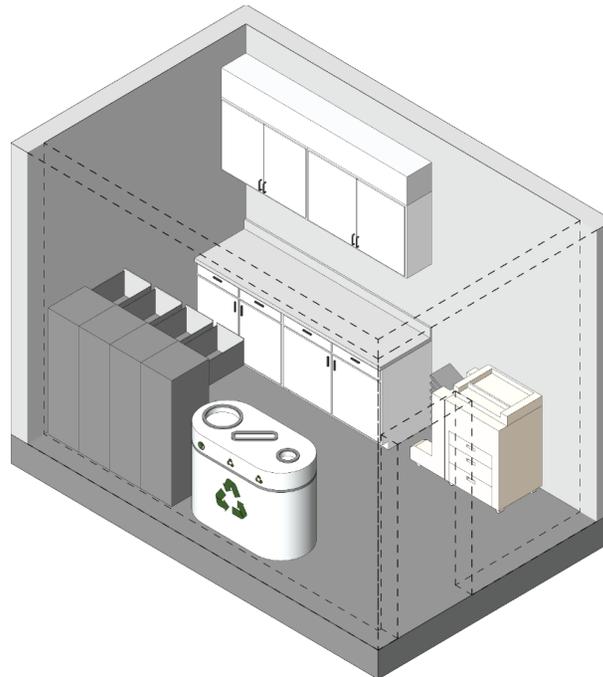

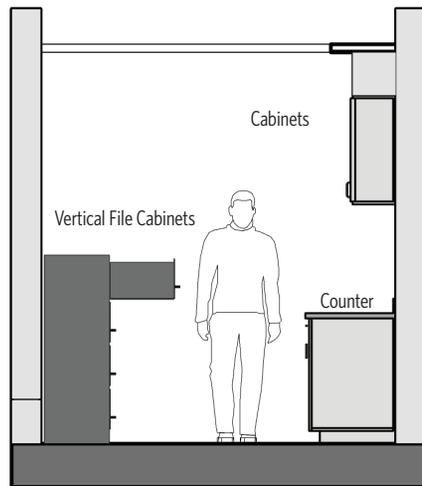

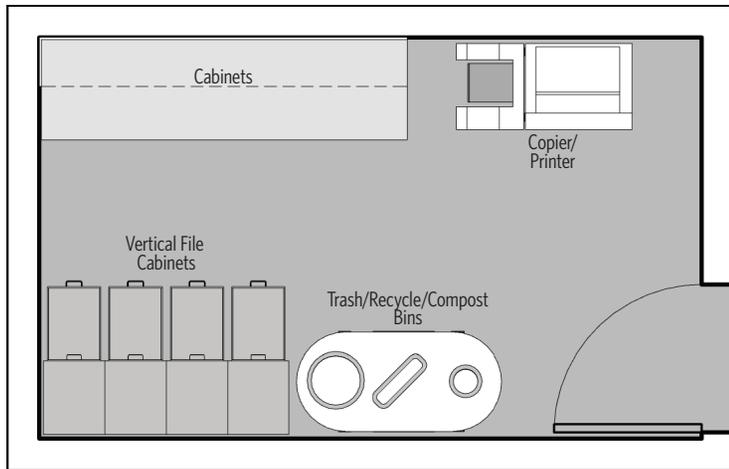

EQUIPMENT/FURNISHINGS

- Shelves
- Racks

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: No exterior exposure
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Keep consistent humidity levels
- Power:
  - ✓ LED lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
- Lighting: Dimmable, indirect lighting with occupancy sensors

COPY/SUPPLY

FUNCTION

Dedicated alcove or room for copier/printer/scanner/fax machine, storage for office supplies, and work surface.

RELATIONSHIP TO OTHER AREAS

- Access to all office areas

CRITICAL DIMENSIONS

- 9' -0" vertical clearance (minimum)

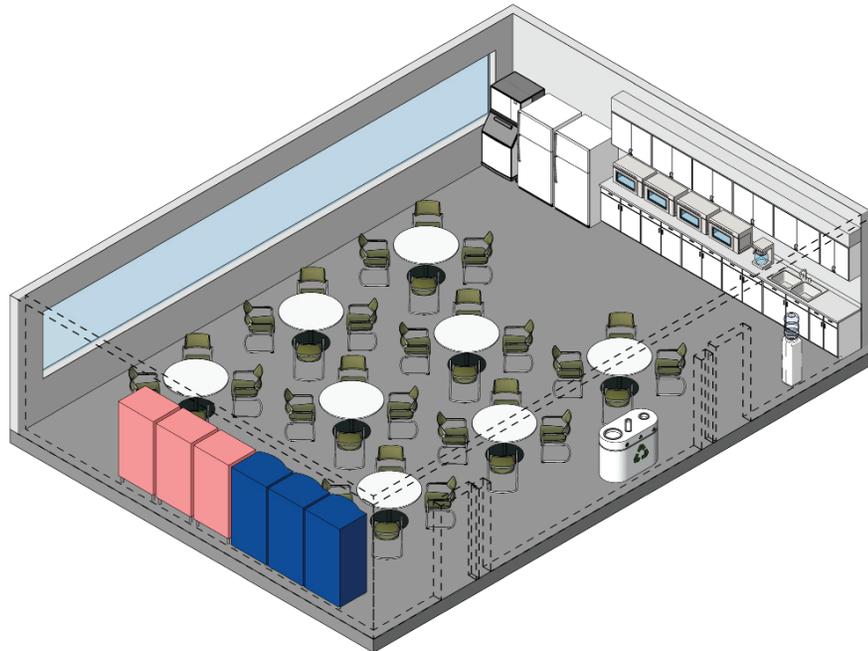

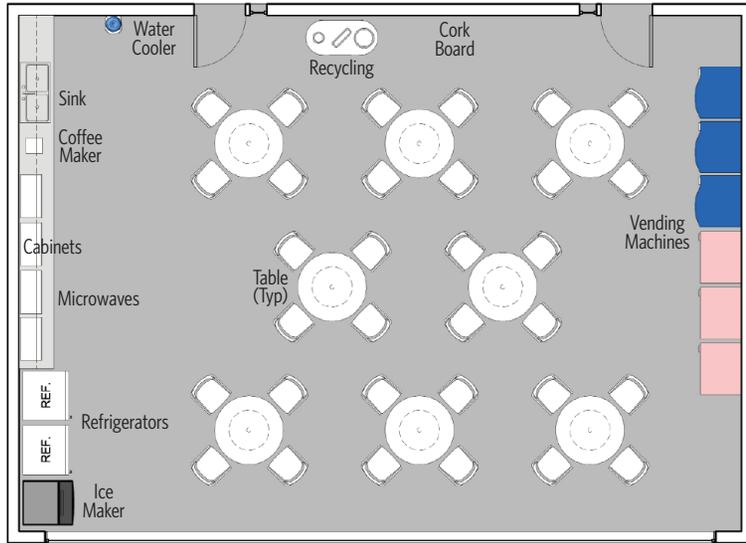

EQUIPMENT/FURNISHINGS

- Copier/printer/scanner/fax machine
- Work surface with cabinets below and above
- Filing cabinets
- Trash/recycling/compost bins
- Millwork

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" door with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide one data outlet with four data ports
  - ✓ Provide box and one inch or larger conduit rough-ins to three other locations in the room
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**BREAK ROOM/KITCHENETTE/VENDING**

**FUNCTION**

Enclosed room for use as a break area for training staff.

**RELATIONSHIP TO OTHER AREAS**

- Access from all Training Office areas

**CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

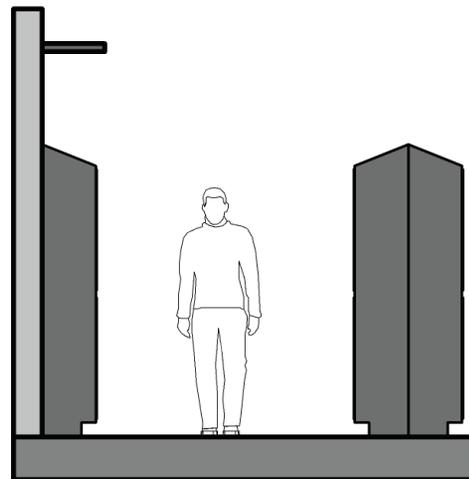

**EQUIPMENT/FURNISHINGS**

- Counter space, upper and lower cabinets, sink, microwaves, refrigerators, vending machines, water coolers, ice maker, water filter, coffee maker, tables, chairs, trash/recycling/compost bins
- Millwork

**DESIGN FEATURES**

- Architectural:
  - ✓ Furniture: Use owner furniture standards (if applicable)
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Plumbing: Rough-in for fixtures
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Provide CO2 detection
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
  - ✓ Provide five GFCI outlets above kitchenette counter
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**OPERATOR LOCKERS**

**FUNCTION**

Co-ed locker room with private changing areas and locker space for Operators to store personal gear and clothing.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Break Room/Kitchenette/Vending
- Adjacent to Men's and Women's Restrooms

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

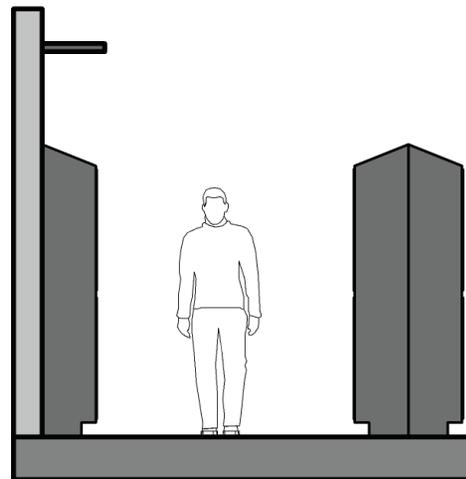

**EQUIPMENT/FURNISHINGS**

- Heavy duty, two tier, 3'-0", well-ventilated, slant top, half-height lockers; one each per Operator assigned to the facility

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering or finished concrete (recommended)
  - ✓ Walls:
    - Tile covering or painted masonry (recommended)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**INSTRUCTOR LOCKER**

**FUNCTION**

Co-ed locker room with private changing areas and locker space for Instructors to store personal gear and clothing.

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Break Room/Kitchenette/Vending
- Adjacent to Men's and Women's Restroom

**CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

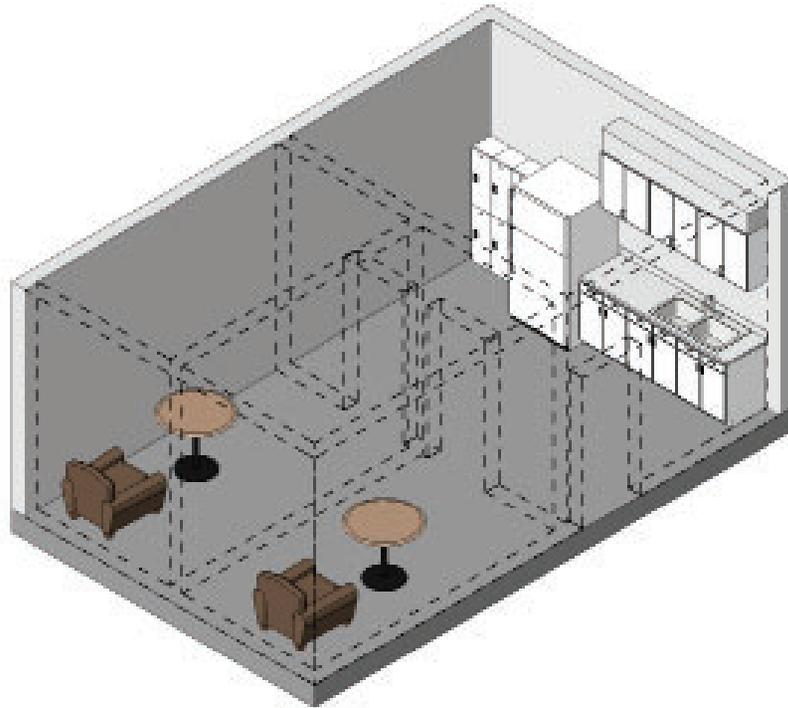

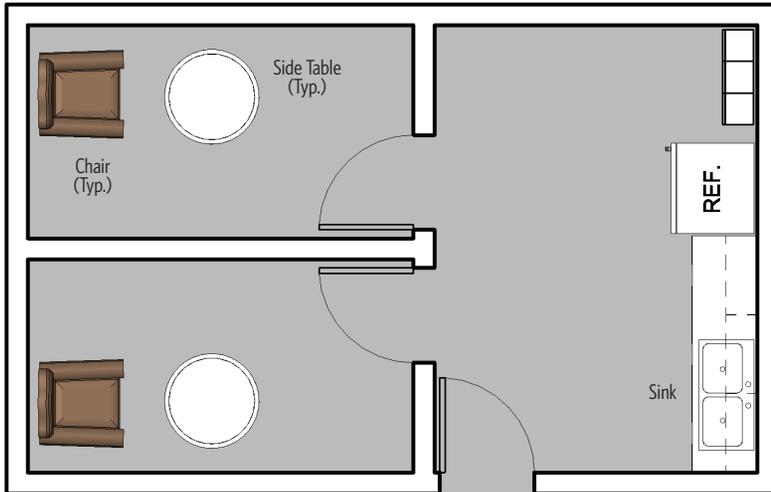

**EQUIPMENT/FURNISHINGS**

- Heavy duty, two tier, 3'-0", well-ventilated, slant top, half-height locker (one each per Instructor assigned to the facility)

**DESIGN FEATURES**

- Architectural:
  - ✓ Flooring: Resilient floor covering or finished concrete (recommended)
  - ✓ Walls:
    - Tile covering or painted masonry (recommended)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
  - ✓ Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide general purpose duplex receptacles (six minimum)
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

LACTATION ROOM

FUNCTION

Dedicated room for personal privacy and storage of first aid supplies and personal care items.

RELATIONSHIP TO OTHER AREAS

- Accessible from department office areas

CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

EQUIPMENT/FURNISHINGS

- Sink with countertops and cabinets
- Secure storage for equipment and supplies
- Lockers
- Side tables
- Refrigerator
- Chairs

DESIGN FEATURES

- Architectural:
  - ✓ Flooring: Resilient floor covering with base or finished concrete (recommended)
  - ✓ Walls:
    - Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
    - Wall protection as needed
  - ✓ Ceiling: Acoustical ceiling tile (recommended)
  - ✓ Doors:
    - Single leaf lockable 3'-0" door with loadable lever set hardware (recommended)
    - Electronically secured entry (as required)
- Plumbing: rough-in for fixtures
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Power:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc indirect lighting average)
  - ✓ Provide general purpose duplex receptacles (three minimum)
  - ✓ Provide one GFCI outlet above counter
- Lighting:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

APPENDIX A:  
MAINTENANCE EQUIPMENT MANUAL

## Introduction

### Overview

The equipment listed in the Equipment List, Datasheets, and Cutsheets is the minimum expectation of the SFMTA for the purpose of the RFP. If SFMTA wishes to require a higher standard of equipment during the PDA phase, then that would be negotiated at that time. The purpose of this document is to reflect the preferences of the SFMTA and provide a high level of detail so that there may be clear expectations on the part of all parties for the type of equipment that is expected and the associated budget. This Appendix was commissioned by the SFMTA in fall of 2018, and it builds on the equipment narrative and strengths and weaknesses discussion in Section 4 of the Design Criteria Document. This Appendix includes:

- Introduction
- Equipment List- organized from low to high equipment ID number.
- Equipment Datasheets
- Equipment Cutsheets

These minimum requirements are based on existing equipment and potential equipment acquisitions. Maintenance equipment described in this Manual represents the needs of each functional area of the facility based on discussions with stakeholders.

Reference Appendix A.

Equipment List Definitions:

Discipline Coordination					Revision	Eqmnt	Description	Unit	Qty	Extended	Dimensions (inches)			Spec By	Furnish/	Projects Comments
Arch	Struc	Mech	Elec	Plum	Note	ID #		Price		Price	Length	Width	Height		Install	
							<b>Fleet Maintenance</b>									
							<b>PM/Inspection Bays (2)</b>									
						1860	Workbench, severe use, 6 feet	1400	2	2800	72	32	34	MDG	CF/CI	
						2832	Vise, swivel base, inches	760	2	1520	14	9-1/4		MI	CF/CI	
						3540	Tank, parts cleaning, 15 gal	100	1	100		22	60	MI	CF/CI	
						7190	Drops, air/electric,	120	2	240		2-1/4		MI		

Category:	Description:
Discipline Coordination:	Identifies other design team disciplines requiring coordination to properly accommodate equipment items in the facility design. Refer to Datasheets for detailed coordination issues.
Equipment Identifier:	All identical equipment items are assigned the same number. The Equipment Identifier coordinates this list with equipment layout drawings, datasheets, and, cutsheets. New equipment items are indicated by a 4-digit Equipment Identifier and owner supplied items are indicated by a 5-digit Equipment Identifier number.
Item Description:	Description for equipment.
Quantity:	The number of equipment items located within the functional area is listed.
Price:	All pricing is list from the manufacturer.
Dimensions:	Overall equipment length, width, and height respectively, listed in inches unless otherwise noted.
Furnish/Install:	Recommends responsibility to furnish and install equipment.
CF/CI	Contractor to furnish and install, usually by bid package specifications for General Contractor installation.
OF/OI	Owner to furnish and install, usually smaller office and shop equipment normally purchased by owner. This also includes any items owner will provide.
Project Comments:	Includes special requirements and other relevant data to be considered during detailed design for the project.

## Equipment Datasheets

The purpose of this document is to identify the various coordination issues and disciplines associated with the types of equipment recommended for facility operations. The Equipment Datasheets are for discipline coordination purposes only. Coordination issues are grouped per Equipment Datasheet according to the following disciplines:

- Architectural
- Structural
- Mechanical
- Electrical
- Plumbing

The equipment design in this document is minimum requirements, with final equipment selection to be made during the PDA phase.

## Equipment Cutsheets

The equipment Cutsheets aid in the identification of equipment and serves to assist the owner with establishing standards of quality items. The Cutsheets establish standards of quality, performance, feature, and construction.

## General Information

- All equipment shall be heavy duty industrial grade.
- All equipment shall be “equal to or better than” the listed equipment.
- Quantities have been established based on initial floor plans. All quantities need to be verified by the final design team.
- At each phase of the design process, the team will need to review the Equipment Layout Drawings and Equipment List with the SFMTA to verify that they are acceptable.

# Preliminary Equipment List

Discipline Coordination							Equip ID#	Description	Qty	Dimensions (inches)			Furnish/ Install	Project Comments
Arch	Struc	Mech	Elec	Plum	Priority Equipment	Seismic Certification				Length	Width	Height		
							<b>MAINTENANCE</b>							
							<b>60' Bus Repair Bay (10)</b>							
			●				1128	Cabinet, computer, mobile	6	26	24	68	CF/CI

## 3290 Equipment Cutsheet

Equipment Description:

**Fume extraction arm, welding**

EQ ID Number:

**3290**

Manufacturer: Airflow systems Inc.

Model No.: EZ Arm 7E14

### E-Z Arm

#### Features & Benefits

- **Patented friction release pawl-and-sprocket design:** Engages positively when positioned, yet offers no resistance when removed.
- **7-, 10-, or 14-foot lengths:** Provides for high-volume collection with maximum reach.
- **Strong HDPE flat base joint:** Easy to install; HDPE bearing material works to seal base without collars or fittings.
- **Large 13-in. dia. inlet hood with 360° flange handle:** Easier hood positioning than single-handle designs.
- **Durable rounded duct constructed of 21-ga. aluminum:** Withstands industrial use, yet lightweight for easy operation. Powder coated inside and outside.
- **Hi-Flow spiral wire-reinforced hose.** Provides superior strength and resistance to sparks and embers.

#### Options

- **65 Watt Halogen Light Kit:** Improves worker visibility and productivity.
- **Damper:** Shut off air flow when not in use.
- **Blowers:** Several sizes available.
- **Silencer:** Reduces air flow noise for quieter operation.
- **Wall Brackets:** Maximizes installation versatility.
- **Adjustable Height Floor Stand:** Maximum height of 120 inches adds installation versatility.
- **Filtration Units:** HEPA, cartridge, and odor-control filter systems available based on application.
- **Boom Extensions:** System includes steel boom arm, boom arm wall bracket, tube kit, flex hose, and one transition to 8-in. dia.

#### Specifications

- **Construction:** 21 ga. aluminum tube with spiral wire-reinforced Hi-Flow hose
- **Arm Lengths:** 7 ft. (E-Z Arm® 7E07) , 10 ft. (E-Z Arm® 7E10), 14 ft. (E-Z Arm® 7E14)
- **Blower Pkgs (HP):** .75, 1.5, 3.0, 5.0, 7.5
- **Nominal Air Flow (CFM):** 600 to 1500
- **Weight (lbs.):** E-Z Arm® 7E07 - 36 lbs., E-Z Arm® 7E10 - 40 lbs., E-Z Arm® 7E14 - 45 lbs.

## GENERAL NOTES

- OCS is only located in the parking areas and certain maintenance bays, as noted.
- Relevant requirements fall in the 2018 criteria (pp 1-5). The remaining information are reference materials that may inform some design decisions.
- LMD shall design a site specific solution, with deviations from the tension requirements outlined in this appendix permitted upon approval by the SFMTA.
- LMD shall take particular note to design an OCS solution for the trolley fleet that anticipates a smooth transition to future battery electric bus.

# APPENDIX B: SFMTA OCS DESIGN CRITERIA

## I. **GENERAL**

These criteria govern the Overhead Contact System (OCS) design, to provide a safe, reliable and efficient system to deliver electrical power to support and Electric Trolleybuses (ETBs).

### A. **References**

The latest edition of the applicable standards, codes, and guidelines of the following organizations shall be used for all designs unless otherwise required by this section:

- California Public Utilities Commission (CPUC) General Order No. 95, Rules for Overhead Line Construction
- California Public Utilities Commission (CPUC) General Order No. 128, Rules for Construction of Underground Electric Supply and Communications Systems.
- Muni High Performance Trolley Coach Overhead Wire Minimum Standards
- Design standards and criteria developed on previous Muni projects
- American with Disabilities Act (ADA), 49 CFR parts 27, 37 and 38
- American National Standards Institute (ANSI) C2, National Electric Safety Code
- American Public Transit Association (APTA) – Rapid Transit Standards
- California Code of Regulation (CCR), Title 8, Industrial Relation
- California Code of Regulation (CCR), Title 23, Waters
- California Code of Regulation (CCR), Title 24, Building Standards Code
- California Occupational Safety and Health Association (Cal OSHA)
- City of San Francisco Standard Plans and Specifications
- Code of Federal Regulations, Title 29, Part 1910, Occupational Safety and Health Standards
- Code of Federal Regulations, Title 41, Public Contracts and Property Management
- Code of Federal Regulations, Title 49, Part 212, State Safety Participation Regulations

- Telecommunications Industry Association (TIA)
- Underwriters Laboratories (UL)
- Uniform Building Code (UBC)
- Uniform Fire Code (UFC)
- Uniform Plumbing Code (UPC)

Where more than one code, standard, or criterion is applicable, the most restrictive shall govern, except as indicated in this document. The Safety Criteria shall be reviewed in light of new editions and issues of these codes and standards at the beginning of each design phase and shall be amended as appropriate. All materials, equipment, design, manufacturing methods, installation, and testing shall conform to all applicable Federal, State, and local codes and regulations. In addition, Muni standards and established Industry Standards and practices shall govern the design and construction.

## **II. DESIGN CRITERIA**

This section provides the general OCS design criteria. Project specific design criteria addressing the project needs should also be incorporated.

### **A. Electric Trolley Buses (ETBs)**

Overhead hardware used should be products of manufacturers regularly engaged in the production of such material and equipment, and is of the manufacturer's latest design

## Capital Programs & Construction

approved by Muni. This is to ensure compatibility and interchangeability with the current Muni overhead hardware and spare parts. The followings are specific hardware characteristics for the project:

1. Hardware Criteria
  - i. Overhead Contact System Type - OCS shall be a rigid type system similar to Ohio Brass (OB)/Westinghouse Air Brake Company (WASCO)/Impulse NC, Inc Contact System or a flexible system similar to Kummler & Matter System.
  - ii. Contact Wire- Contact wire shall be bronze, grooved, alloy 80 conforming to ASTM B9-90. The following characteristics shall be used:

**Table II.B.1 Trolley System Contact Wire Standards**

Description	Min. Standards
Contact Wire for Trolley Vehicles	#4/0 or #2/0
#4/0 Contact Wire Tension @ 60°F	3000 lb per wire
#2/0 Contact Wire Tension @ 60°F	2000 lb per wire
Contact Wire Height	19ft-6in ± 3in
Contact Wire Spacing	2ft
Axis of Trolley wire pair from curb unless otherwise noted	14ft
Maximum Unsupported Contact Wire Span	100ft

- iii. Overhead Components and Trolley Wire Replacement – Replace overhead components and trolley wires that have a service life of less than 50%.
  - iv. Leading Switch -15° Induction Controlled
2. Trolley Wire Alignment shall be in accordance with guidelines and criteria established by Municipal Railway High Performance Trolley Coach Overhead Minimum Standards.

### C. Overhead Supports and Foundations

#### 1. OCS Poles

Steel poles shall be in accordance with Muni Standard Drawing CL-7971, Rev. 2. Standard pole Types 761N, 765N, 767 and 770 should be used.

New poles should be in line with property line between adjacent properties and avoid fronting doors, windows, and access ways wherever possible. They should be

## Capital Programs & Construction

located within the first flag from the curb (18in to near side face and 24in to center of pole approximately). New poles should be 3ft from low-pressure hydrant and 5ft from high-pressure hydrant from centerline of pole to centerline of hydrant. New poles should be located away from new and existing ADA curb ramps, trees, sub-sidewalk basements, etc.

Where an existing pole is replaced with a new pole, the new pole should be 4ft away (minimum) from the present location. At intersections adjoining side platforms the poles should be as clear of the corner as possible to avoid being hit by right turning trucks. Other overhead utilities might share pole and air space such as PG&E, PAC Bell, TCI and/or Viacom.

Wherever possible, poles should be combined with streetlight and traffic signals to reduce the number of poles. Combination poles should be located within 3ft of perpendicular property line.

Poles with feeder risers inside should not be combined with traffic signals.

### 2. Poles Foundations

Unless otherwise noted, existing foundations should be removed to a depth of 3ft below the finished grade. Where a pole has to be replaced in place due to space constraint, the existing foundation should be removed entirely and new foundation installed in place.

New standard pole foundations shall be in accordance with Muni Standard Drawing CL-7971, Rev. 2. Where special foundations are required, they shall be designed according to the current codes, regulations and field conditions.

### 3. Pole Replacement

Replace City-owned wood, segmented, concrete, and/or steel poles that are bending, leaning, deeply pitted, undersized, with exposed rebars, rusted and/or with holes along the shaft or base.

### 4. Protection Devices

Wood troughs, preformed glass/epoxy shields, or approved apparatus of a custom design if necessary, should be used wherever the overhead support structure shall be protected against possible arcing conditions and in accordance to the GO 95, Rules for Overhead Lines Construction.

Guy wire span supports shall include tree guard or similar item to protect against trolley shoe snags during dewirement from a trolley vehicle.

### 5. Finish Treatment

Unless otherwise required by urban design requirements or streetscape master plan, new steel pole shall have a galvanized finish (Not Painted). Existing steel trolley pole shall be painted to match galvanizing or existing coating color. Anti-graffiti coating shall be applied to the bottom 8 ft of the pole.

### 6. All new OCS poles shall be grounded.

RE: TRANSMISSION OF TROLLEY COACH OVERHEAD WIRE GUIDELINES

Enclosed is a copy of the Municipal Railway High Performance Trolley Coach Overhead Standards. These standards represent MUNI policy on those issues relative to the design of our Trolley Coach Overhead System, and should be followed by UEB designers on MUNI trolley overhead projects. If UEB believes that these standards cannot be applied to a particular circumstance, which will happen, the MUNI project coordinator should be contacted to review the circumstances.

Our staff is prepared to work with your Project Managers and Designers in implementing these guidelines. In particular, we will be providing UEB with explanatory drawings of key concepts contained in the guidelines.

These guidelines should eliminate the need for ad hoc communication between MUNI personnel and UEB designers during the design phase of these projects, and all communication will go through the UEB Project Manager to/from the MUNI Project Coordinator.

DATE: April 6, 1989  
RE: TROLLEY COACH OVERHEAD DESIGN STANDARDS/SIGN-OFF

Enclosed is the final draft of the Trolley Coach Overhead Design Standards. These standards were drafted by Carl Natvig of the Service Planning Department, and revised by the Trolley Coach Overhead Committee. The members of the committee are Art Curtis (Deputy Superintendent Surface Transportation), Harold Conklin (Manager, Hetch Hetchy Overhead Lines Department), Peter Straus (Director of Service Planning), and Galen Sarno (Chief Electrical Engineer, MRED). All have approved this final draft for use by UEB designers when designing new or reconstructed trolley overhead projects.

These standards incorporate the decision you made, based on the recommendation of Ed Pearson, that Ohio Brass-type suspension should be employed on all tangent wire at this time.

We recommend that you approve these guidelines by signing the enclosed transmission memo to UEB.

We also want to thank Bobbie Chapman for doing such a super job of typing the many drafts of this document in both a professional and pleasant manner.

Enc.

DESGNSTD

MUNICIPAL RAILWAY  
 HIGH PERFORMANCE TROLLEY COACH OVERHEAD WIRE  
 MINIMUM STANDARDS

*\*note: @ all cases, use template which has a better visual view of what is really happen.*

**I. SWITCHES**

*regular service switch*

*from station to route*

**A. Scheduled Service or Pull-in Pull-out Switches**

1. Mechanical Crossing.

-(10 degree switch is awaiting test results)-

- a. Leading Switches. A 10 or 15-degree mechanical crossing with stainless steel or similarly moveable runners shall be used for all regularly used leading switches.
- b. Trailing Switches. A 10 or 15-degree mechanical crossing with stainless steel or similarly durable moveable runners shall be used for all regularly used trailing switches.
- c. Preferred Direction. The runners shall be set to favor the more heavily used direction where use is 50% less and speeds below 15 mph in the less used direction.

2. Inductive Control.

*and 10°*  
 Inductive control shall be provided for all advance 15-degree switches.

3. Single-coil. A single-coil with mechanical reset shall be employed with inductive control switches.

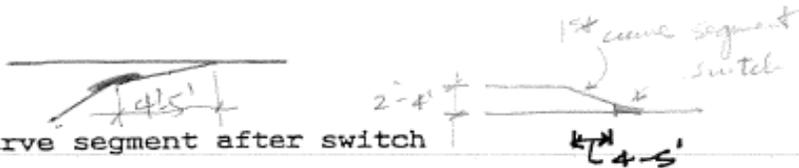

*min. - not prefer double-coil.*

4. Advance Switch Spacings. All regularly used leading switches shall be located in advance of the intersection as follows:

- a. Leading switch to intersection nearside stop line
  - (1) Left or right-hand - one or two lanes in each direction .....90-110 feet (one span)
  - (2) Left-turn - three or more lanes in direction of travel .....300-400 feet (three or four spans)
  - (3) Left-turn - unique condition (auto queues, etc.) .....as specified by MUNI

b. First curve segment after switch

First curve segment to advance switch  
 .....4-5 feet

(From the trailing tip of the switch crossing plate or insulated runner assembly to the leading tip of the curve segment.)  
 (To minimize forward acceleration on poles.)

- c. Inductive antenna to leading switch  
 .....40 feet
  - d. Inductive antenna to indicator light  
 .....170 to 240 feet  
 (i.e. second span from switch or as specified by MUNI)
5. Indicator Lights. Indicator lights (see reference drawing) shall have the following characteristics:
- a. 8 inch lenses.
  - b. Masked for 1-1/2 by 6 inches.
  - c. Double filament lamps if available.
  - d. Straight indication on top, diagonal turn indication below.
  - e. Pole-mounted wherever possible. Guy mounts may be used where there are visual obstructions or when requested by MUNI.
  - f. 8 inch hood.
  - g. Lamp voltage and series resistance designed for minimum 2-year life.
  - h. A micro-switch as specified by MUNI shall be used for the light switch.

6. Control Wiring.

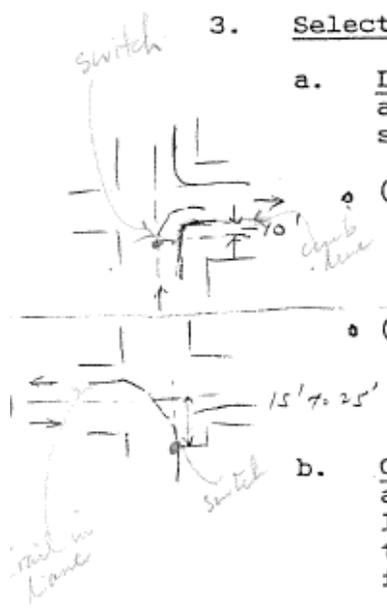

- a. Control wiring shall be suspended from a separate messenger wire of 3/16 inch diameter at least 2 feet above the contact wire level.
- b. Control wire cable shall be multi-conductor, color coded, single jacket. *in spec.*

7. Y-Switches. A 10 or 15-degree Y-switch shall be used where the dominant direction of travel is in the turning direction.

*mostly 30°* (NON REVENUE ROUTE)  
B. Emergency Switches (NON REVENUE ROUTE)

1. 30-Degree Switches. *Lead* Selectric 30-degree switches shall be employed for all right turns and for all left turns with the exception of left turns where there is more than one lane in the direction of travel. (No 23-degree switches shall be used.)
2. Advance Switches. Advance, left-hand, inductive 10 or 15-degree switches shall be employed for left turns on streets with more than one lane on the lead-in street.
3. Selectric Switch and Curve Segment Location.

a. Leading Selectric Switch. The following standards are intended to prevent the false activation of selectric switches:

- (1) Right-turns. The leading switch frogs shall be located approximately 10 feet before the curb line of the trail-in street for right turns.
- (2) Left-turns. The leading switch frogs shall be located approximately 15 to 25 feet before the traffic dividing line of the trail-in street for left turns.

b. Curve Segment. The first curve segment shall have a spacing of 0-5 feet from the trailing tip of the leading selectric switch to the leading tip of the curve segment for right turns and 0-10 feet for left turns.

c. Trailing Switch. The trailing switch shall be located over the center-rear of turning coaches wherever possible.

d. Selectric Switch Alignment. Selectric switch layouts need not be aligned over the inside rear corner of turning coaches.

*use len plate instead of these guidelines*  
*shall be a straight crossing always*

8. Combination Curve-Crossings. No combination curve-crossings shall be used unless specifically approved by MUNI. Additional curve segments shall be used to avoid use of combination curve-crossings.

9. Tangent Clamps. A maximum of 1.25 degrees per foot of curve runner or per HS-type clamp shall be used.  
*use if angle less than 5°*

10. Curve Alignment. All curve segments shall be located over the inside rear corner of the turning coach as determined by field tests. The location of coach stops should be considered in determining the typical path of a turning coach.

*Diagram for item 10: A hand-drawn diagram showing a curved path of a coach. It includes a 'stop line' and 'striping' markings. Dimensions of 2'-3" and 2'-4" are indicated. A 'Second' label is circled and points to a specific location on the curve.*

a. Right Turns. The contact wire axis shall be 2-3 feet from the curb at the apex of right turns; and the ~~apex~~ and last curve segments shall be 8 to 11 feet from the curb unless specified otherwise by MUNI. *Second*

b. Left Turns. As a general rule, the left turn wire should pass over the two intersecting points of the stop lines and the traffic dividing lines in the path of the turning coach (on two-way, one lane per direction streets).

11. Guying in Turns. Curve segments shall be located in such manner axially and laterally within plus or minus  $\pm$  2 feet of the path of the inner rear corner of the turning coach to minimize the amount of guying required to support the curve segments.

*Diagram for item 11: A hand-drawn diagram showing a rectangular path of a coach with dimensions 5'-4" and 2'-2". A 'path of coach' label points to the inner corner of the path.*

B. Emergency Routes

1. Curvature. A maximum of 30 degrees per curve segment shall be used.
2. Long Radius Turns. For turns with a radius of 50 feet or greater, additional curve segments shall be used as needed.
3. Combination Curve-Crossings. No combination curve-crossings shall be used unless specifically approved by MUNI. Additional curve segments shall be used to avoid use of combination curve-crossings.
4. Curve Alignment. (The same as for regularly used turns with the exception of selectric switch turn lay-outs.)

---

III. SECTION INSULATORS  
(No. Bos, Breakers, Insulated Runners)

- A. Far-Side Crossings. Insulated runners shall be in the far-side crossing for each direction of coach travel at intersections.
- B. Section Insulators. Insulated runners between circuits shall be located in non-accelerating locations if a far-side crossing is not available.
- C. Switches. Insulated runners in switches shall be in the turn-out direction in leading and trailing switches.
- D. Exceptions. Exceptions to the location of insulated runners shall be employed only when specified by MUNI. Possible exceptions may be as follows:
  - 1. Some crossings in left-turns.
  - 2. Some crossing locations with steep up-hill grades on narrow streets with heavy traffic.
  - 3. Some switches where the turning direction is the dominant direction of travel.
  - 4. Emergency routes will generally have all the insulated runners when crossing revenue routes.
- E. Magnetic Blowout. Magnetic blowouts of a type approved by MUNI (a permanent magnet type is now used) shall be used on the first insulated runner of switches, crossings, and section insulators.

IV. TANGENT WIRE

- A. Tangent Wire Suspension. OB type or equivalent suspension system will be used on all tangent runs.
- B. Concave and Convex Vertical Curves. All vertical curves shall be designed for 25 mph or the typical speed of traffic, whichever is greater, with a maximum of 1.25 degrees of curvature per foot of runner. (A lower design speed may be used where coaches turn sharply at the vertical curve.) Vertically curved K & M clamp-type curve runners (with rigid suspension), K & M copper tubing with passage clamps, or equivalent clamp-type runner shall be used.
- C. Single-Track. Bracket arms or davit poles with flexible suspension shall be used for single-track runs except: concave vertical curves; where distances between the curb and wire locations are more than 18 feet; or where trolley poles are already in place.
- D. Tangent Wire Axis. The following wire axis to curb distances shall be used:
  - 1. One or two lanes per direction.
    - a. For streets narrower than 48 feet:  
-14 feet OR center of traffic lane - whichever is greater.  
*Center of trolley wires to curb line*
    - b. For streets wider than 48 feet:  
-16 feet OR center of traffic lane - whichever is greater.
  - 2. Three lanes per direction.  
.....center of traffic lane plus 3 feet  
-18 feet maximum
  - 3. Three lanes per direction with loading bulbs  
-20 feet  
(only where all stops have bulbs)

\* Parameter = 450 - 18' CLEARANCE  
600 - 19' CLEARANCE. *according to DPT/OPW? criteria?*

VII. INTERSECTIONS

- A. Network Guys. A maximum of three guys shall be attached to bull rings on the high tension side of curve segment support networks. A greater effort to network and reduce guys should be employed in residential areas than in industrial areas.
- B. Brail Wires. Brail wires shall be used primarily on the inside of turn layouts and be located a minimum of 3 feet from parallel contact wires.
- C. Constant-Carbon-Contact. Constant-carbon-contact for all crossing plates and switches shall be used. Fabricated OB deep-runner crossing plates shall not be used. ?
- D. Design Life. Adequate minimum runner depth in flangeways of crossing plates and switch plates shall be employed to allow for a clearance of 1-3/8 inches after 2 million carbon trolley shoe passages (with a pressure of 28 pounds). Flangeways shall be configured to allow easy passage of bent poles.
- E. Pole Location. Generally, trolley support poles should be located to minimize the total length of guy wires. Generally, no more than 2 poles per corner should be used. Generally, advance switches should be located one span from the adjacent intersection, the main tension guy (head guy) attached to the switch should be attached to a pole or poles one span from the switch.
- F. Eyebolts. Eyebolts shall be employed wherever practical to install and if buildings of suitable strength are available. (City policy requires that all new buildings of adequate strength along existing or proposed trolley coach routes must provide eyebolts.)
- G. Traffic Signal Pre-empts. Traffic signal pre-empts shall be provided at signalized intersections as specified by MUNI (in consultation with other City departments). New signalized intersections shall be provided as specified by MUNI (in consultation with other City departments).

PUBLIC UTILITIES COMMISSION CITY AND COUNTY OF SAN FRANCISCO

### MUNI OVERHEAD TROUGH SUSPENSION INSTRUCTION

The trough for Muni Overhead suspension should be made of hardwood and it should be waterproof for outside use. But if it has to be installed inside a building or in an enclosure, then the wood need not be necessarily be waterproof. All troughs should be designed in a way that will enable the crew to reach the top above the trough during maintenance so that you can repair insulators that support the overhead in the trough.

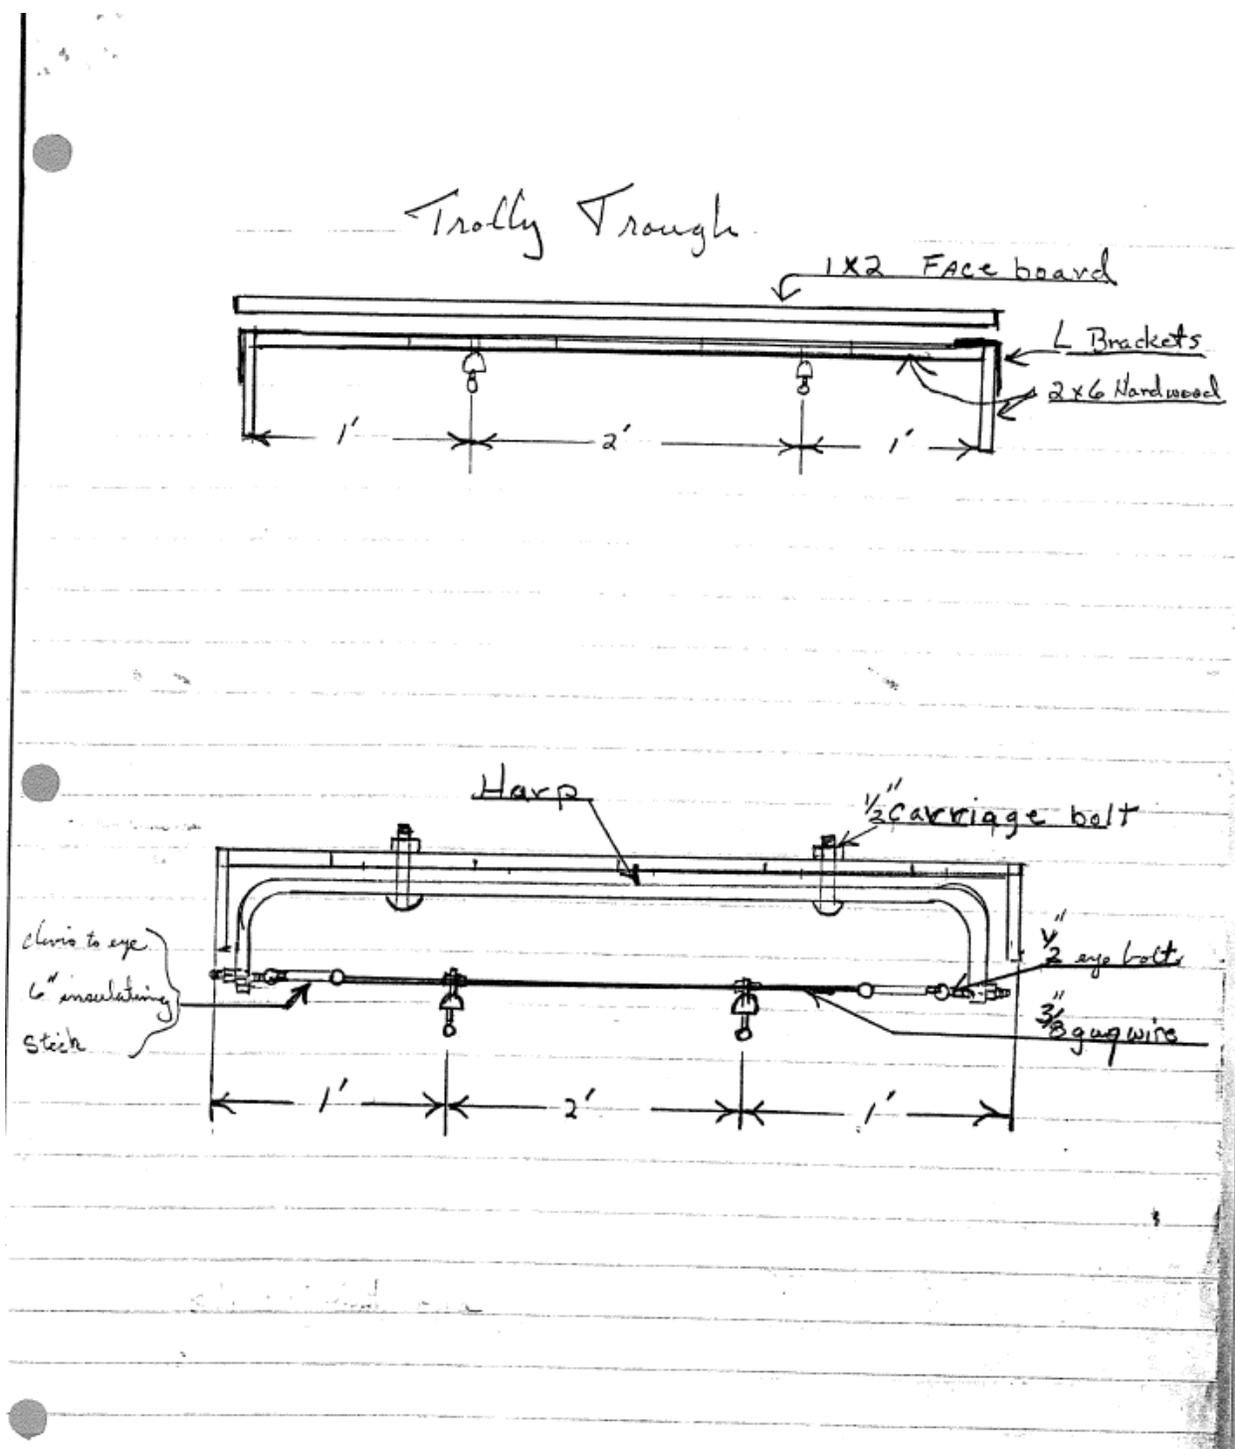

The wood should run parallel with the wire and be made of 2" x 6" as well as the kickboard on the sides. On each side of the outside wire, should have a 1 foot clearance between the wire and kickboard. A 1" x 2" board should be installed on the face of the trough to prevent the wood from splitting from poles hitting it. An "L" bracket should be installed to strengthen the kickboard from pulling apart. The trough should extend 2 feet passed the ends of the structure so we can mount a harp if needed.

Harps should be installed where the nearest tangent support wire is more than 60 feet from either end of the trough. Harps are made of steel channel iron 6" x 1" and have 2 clevis to eye 6" stick, with threaded eye bolt to adjust tension on harp. Harps should be 4 feet long (see attached drawing on Harp).

Splice joints should be made of channel iron 2" x 6" to give support to splices in trough so it would not sag.

Also, lags and wood screws should not be used because they will only pull apart. When putting together splices and attachments always use nuts, bolts, lock washers and flat washers.

*USE 1/2" CARTRIDGE BOLT*

525. 24 : 08 '87

## WORKING PROPERTIES OF COMMON WOODS

Name of Wood	General Characteristics							Machining					Remarks
	Weight per Cu. Ft. (1)	Hardness	Strength (2)	Stability (3)	Gluing	Nailing (4)	Steam Bending	Planing and Jointing (5)	Turning (6)	Sanding (7)	Shaping	Mortising (8)	
Ash	35	Med.	Med.	Best	Fair	Good	Good	Good 10-25		Best 2/0			Tough - Hard to work with hand tools.
Basswood	24	Soft	Weak	Good	Best	Best	Poor	Good 20-30	Poor	Poor	Poor	Fair	Excellent for trays, drafting boards.
Beach	39	Hard	Med.	Poor	Poor	Poor	Good	Fair 10-20	Fair	Good 4/0	Fair	Best	Not durable outside. Hard on tools because of mineral deposits.
Birch	40	Hard	Strong	Fair	Fair	Poor	Good	Good 15-20	Good	Fair 4/0	Best	Best	Excellent for furniture, turning, dowels, handles.
Butternut	25	Soft	Weak	Best	Good	Fair	Poor	Good 10-25	Good	Fair 4/0	Fair	Fair	Furniture—Perfect for walnut imitation.
Cherry	36	Med.	Med.	Good	Best	Fair	Poor	Best 10-25	Best	Best 4/0	Best	Best	Furniture, hand trim, novelties.
Chestnut	27	Soft	Weak	Best	Best	Good	Fair	Good 15-20	Best	Best 3/0	Good	Good	Stains badly in contact with wet iron. Very dusty in all machining ops.
Cottonwood	27	Soft	Weak	Fair	Best	Best	Poor	Poor 5-20	Poor	Poor 4/0	Poor	Fair	Excellent for boxes & other nailing jobs—wears very well for soft wood.
Cypress	29	Soft	Med.	Good	Fair	Fair	Poor	Good 15-25	Poor	Fair 2/0	Poor	Poor	Tends to splinter. Most durable of Amer. woods for outdoor & soil expos.
Elm (Southern)	34	Med.	Med.	Poor	Fair	Best	Good	Poor 15-20	Poor	Good 2/0	Poor	Good	Very durable under paint. A good furn. wood despite diff. in machining.
Gum (Red)	33	Med.	Med.	Poor	Best	Good	Fair	Fair 10-20	Best	Fair 4/0	Fair	Fair	One of the most used furn. woods for imitations of walnut & mahogany.
Hickory	42	Hard	Strong	Good	Good	Poor	Good	Good 10-25	Good	Best 2/0	Fair	Best	Excellent for furniture & steam bending, tool handles, wheels.
Poplar	30	Soft	Weak	Fair	Best	Best	Best	Good 5-15	Fair	Good 4/0	Good	Poor	Excellent for steam bending. Often marketed as poplar.
Mahogany	35	Med.	Med.	Best	Best	Good	Poor	Good 5-25	Best	Good 4/0	Best	Best	One of the best furniture woods
Mahogany (Phil.)	33	Med.	Med.	Best	Best	Good	Poor	Good 5-25	Good	Poor 3/0	Fair	Fair	Generally coarser & softer than true mahogany. Furn., boat planking, trim
(9) Maple (Hard)	41	Hard	Strong	Good	Fair	Poor	Fair	Fair 15-20	Good	Good 4/0	Best	Best	Fine furn., flooring, turnings, bowling pins. One of the best hardwoods.
Maple (Soft)	31	Med.	Med.	Fair	Good	Fair	Fair	Poor 10-15	Fair	Good 4/0	Fair	Poor	Some uses as hard maple but an inferior wood. Difficult to mach. smth.
Oak (Red)	39	Hard	Strong	Best	Good	Good	Best	Best 10-25	Good	Best 2/0	Fair	Best	Substitute for white oak in cheaper work.
Oak (White)	40	Hard	Strong	Best	Good	Good	Best	Best 10-20	Good	Best 2/0	Good	Best	Interior trim, floors, furniture. One of the most used American woods.
Pine (White)	25	Soft	Weak	Good	Best	Best	Poor	Good 10-25	Good	Fair 2/0	Good	Fair	Best all around soft wood. Excellent for paint.
Pine (Yellow)	38	Hard	Strong	Fair	Fair	Poor	Poor	Good 10-25	Poor	Fair 2/0	Good	Good	Main uses—house construction, trim, floors.
Poplar	29	Soft	Weak	Good	Best	Best	Fair	Good 5-20	Good	Poor 4/0	Poor	Fair	Excellent for carvings, toys, corestock.
Redwood	29	Soft	Med.	Best	Best	Good	Poor	Good 10-25	Fair	Poor 2/0	Good	Poor	Excellent for outdoor furniture, window sills, etc.
Sycamore	35	Med.	Med.	Poor	Good	Best	Poor	Poor 5-15	Good	Poor 3/0	Poor	Best	Interior trim, furniture. Difficult to mach. but excellent appearance.
Walnut	36	Med.	Strong	Best	Best	Fair	Good	Good 15-20	Best	Best 4/0	Good	Best	Has every good feature for furniture and cabinet work.

**NOTES:** Data in this chart is largely from extensive tests made by U.S. Forest Products Laboratory, with some additions.

- Pounds per cubic foot, dry. All woods vary in weight, even in the same tree from trunk to top. A variation of 10% or over under average should be allowed.
- Composite strength value. Woods rated weak are strong enough for all average work.
- Rated on unrestrained warp. Most woods are quite stable if properly seasoned and cared for.
- Rated on ability to take nails near end without splitting.
- Rated on flat grain stock, shallow cut. Rating is average from runs at 15, 20 and 25-degree cutting angles. Bottom figure is best knife angle for smooth cutting.
- Rated on smooth cutting and ability to hold detail. Not much difference between best and good.
- Rated on freedom from fuzz. Bottom figure is
- Rated on smoothness of cut. Work speed decreases with hardness of wood and this factor might be of more importance than smoothness in production work.
- Sugar, white or hard maple. Should be distinguished from silver, red, big-leaf or soft maple, which is an inferior machining wood although often marketed simply as "maple."

*Please file with your Trolley Overhead Standards*

SAN FRANCISCO MUNICIPAL RAILWAY 949 PRESIDIO AVENUE, SAN FRANCISCO, CALIF. 94115 415-673-6864

TO: DICK BRANDT

FROM: JOHNNY B. STEIN *Johnny B Stein*

DATE: JANUARY 31, 1994

RE: AMENDMENTS TO TROLLEY OVERHEAD DESIGN STANDARDS

The enclosed document is a set of amendments to the High Performance Trolley Overhead Standards originally transmitted to you in 1989. While the original standards have been extremely helpful in designing improved and consistent overhead projects, they were incomplete in some areas and need revisions in others.

Therefore the purpose of the enclosed amendments is to set standards in areas that were not covered by the original guidelines (tensioning and support), or to make changes in other areas (guy wire, control wiring).

Since these standards were worked out in meetings between our overhead committee and your overhead design staff they should be easy to understand and implement. In fact some of these concepts are being incorporated on a project by project basis but have not yet been codified as a set of amendments to the standards.

Please call John Katz if you have any questions about the content of these standards. Thank you.

John Katz  
Hoy Wong  
Vic Lameyse  
Peter Straus  
Art Curtis  
Carl Natvig

VIII. TENSIONING AND SUPPORT

- A. Head Guy. Only the head guy wire should be held with great tension.
- B. Side Guys.
  - 1. All side guys should be attached lightly to special work, usually about 200-300 lbs. tension.
  - 2. All side guy wires should be hung from the highest point on the pole so they will not interfere with other guy wires or contact wire.
- C. Tangent Span Tension.
  - 1. Tangent spans are installed to support the trolley wire weight only, except where there are significant grade slopes.
  - 2. In most cases tension on tangent spans should be not more than 500 lbs.
- D. Curve Segment Guy Strands. Where possible each curve segment guy strand should be supported independently of the other curve segments. Multiple guying to several segments in the opposing corner and/or special work should be avoided. The exception to this is where parallel turns can be supported by one guy wire.
- E. Final Contractor Adjustment. After initial installation but prior to final acceptance of the job the contractor should adjust pole band heights of guy wire in order to avoid guy wire interference coming within one foot of contact wire. This can be done by having the contractor leave a 2' tail on the end of the guy wire at the pole. The remaining tail should be cut off at the completion of the final adjustment.

IX. GUY WIRE SIZE AND TYPE

- A. Type. Use 3/8" utilities guy wire rated at least utilities grade 4. Do not use fiber guys. (replaces section VI-E)
- B. Securing Guy Wire. Preforms and dead end automatic will be used to secure guy wire. Do not use crimp on sleeves for dead ending.
- C. Do Not Use Thimbles. Thimbles for securing guy wire are not used and should be eliminated from all future material lists.

*tools can do by spec.*

X. CONTROL CABLE AND WIRING  
(Replaces existing section 1-A-6.)

- A. Type. Multiple Control Cable should be seven (7), #14 wire single jacket with messenger.
- B. Messenger Wire. Messenger wire should be 1/4 inch diameter, suspended at least 2 feet above contact wire.
- C. Color Code. Muni will provide the color coding for control wiring for switches and multiple control cable. The contractor should not proceed with installation unless the wire colors are consistent with Muni color coding.
- D. All control wire should be installed with fuse protection.

**MEMORANDUM**

TO: Johnny B. Stein  
FROM: Richard E. Brandt *R.E.B.*  
SUBJECT: Trolley Overhead Design Standards

Thank you for your update of the Trolley Overhead Design Standards of January 31, 1994.

This update formalizes the current design practice being used as agreed by the Overhead Committee.

It should be remembered that these are general guidelines which sometimes have to be varied to meet site specific conditions.

For example, MUNI has advised as that esthetics and minimizing the impact on views are important considerations in the design of the overhead along the Embarcadero. If we were to follow VIII D literally and not use multiple guying, the additional poles and individual guy wires would block views and result in an unesthetic design.

bcc: M File  
W. Neilson  
W. Wong  
Overhead Section

ja-STANDRDS.WN

SECTION

OVERHEAD WIRE SYSTEM

1. GENERAL:

The overhead trolley wires will provide electrical power to streetcars at 615 VDC. The PCC and other historic streetcars will be equipped with trolley poles to take power from overhead trolley wires. Contact wire will be installed over each track by means of carbon wipers.

Current will be returned through the rails in the street.

2. DESIGN CRITERIA:

a. CONTACT WIRE:

The contact wire will be supported by span wires. The following characteristics will be used:

Material	Alloy 80 Bronze
Type	Round, grooved ASTM B9-47
Size	# 4/0 AWG
Height	18'-6" to 19'-0"
Supports	110 ft <i>100 ft</i>
Design Voltage	615 VDC
Design Tension	3,000 lbs

b. SPECIAL TRACKWORK & CURVE CONSTRUCTION:

At rail line crossovers and turnouts, the overhead system will be designed to maintain contact between the wire and the PCC trolley shoe.

Overhead system construction at the curves will require the ~~contact~~ <sup>contact</sup> wire to be offset (~~pulled off~~) to maintain continuity of contact between the cars and the contact wire. Each curve radius will require evaluation of the following parameters to determine the pull off spacing. *Pull-off will be spaced per drawing K-41, "Location of Contact Wire Above Track For Pole And Pantograph Operation"*

- minimum curve radius
- radius of spiral curve entering
- radius of spiral curve leaving
- curve super elevation

c. SWITCHES:

Leading and trailing switches shall be 15° mechanical crossings with stainless steel or similarly durable moveable runners used for all regularly used switches.

## Capital Programs & Construction

d. TURNS:

Curvature: Curve segment shall not exceed 3.125° per foot of runner on 90° turns.

VI-20

e. Poles: Number of poles will be minimized by combining trolley, streetlight and traffic signal poles where feasible. Poles will be ATEA 700 series.

### DESIGN CODES AND GUIDELINES

Design codes and guidelines applicable to this project are as follows:

#### Trolley Overhead

Muni High Performance Trolley Coach Overhead Wire Minimum Standards. Revised 03/20/89.

General Order No. 95 of the Public Utilities Commission of the State of California, March 1981.

Design standards and criteria developed on previous trolley overhead projects.

#### Safety - Cal/OSHA

Pole - American Transit Engineering Association (ATEA, Section DT5-57). Revised and approved as standard 1957.

#### Foundation and Concrete

City and County of San Francisco DPW Standard Specification (Section 800.11), July 1986.

American Concrete Institute (ACI 318-83) November 1983.

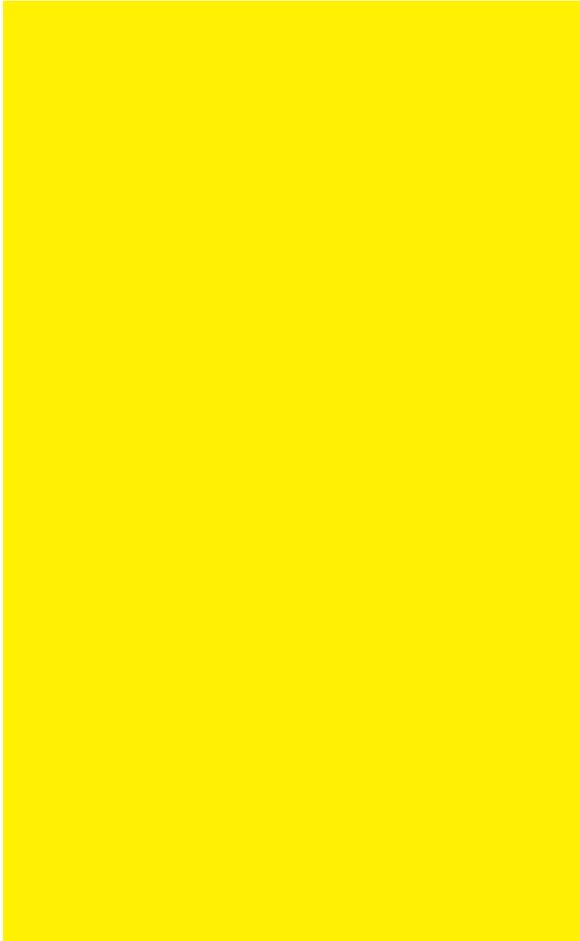

## Capital Programs & Construction

### Others (Latest Edition)

- Public Works Code Electrical Code, Traffic Code and other applicable ordinances of the City and County of San Francisco. July 1986
- American National Standards Institute (ANSI)
- American Society for Testing and Materials (ASTM)
- Electric Industries Association (EIA)
- Insulated Cable Engineers Association (ICEA)
- Institute of Electrical and Electronic Engineers (IEEE)
- National Electrical Manufacturers Association (NEMA)

- General Order 128 of the Public Utilities Commission of the State of California.

APPENDIX C:  
SFPUC APPLICATION FOR  
ELECTRICAL SERVICE

**Potrero Yard Modernization Project**

**2500 Mariposa Street**

**SF Public Utilities Commission (PUC)**

**Wholesale Distribution Tariff (WDT) Application for Power Service**

## Enclosed Application Materials:

1. Feeder 1 Application (Industrial Load)	3
2. Feeder 2 Application (Mixed Use Load)	15
3. Single Line Diagram Feeder 1	27
4. Single Line Diagram Feeder 2	29
5. Floor Plan	31
6. Site Survey	33
7. Electrical Plans	35

## 1. FEEDER 1 APPLICATION (INDUSTRIAL LOAD)

This application covers the bus facility load and a portion of the battery electric bus charging load. NFPA70 Article 625 Sec42 states automatic load management system can be used for feeder rating. Based on modeling, estimated peak load with load management is 9,941kW. Designs include automatic load management and intelligent switchgear that can function as a backup to the load management limiting peak demand to 9,941kW. Second service requested for remainder of chargers & site load.

The total peak BEB charging load is ~12.7MW, split between two feeders. Feeder 1 is all BEB and anticipated to peak around 9.9 MW. Feeder 2 is mixed between BEB charging, residential, bus operations, and commercial uses. This totals 3MW peak for residential, 5MW for commercial/bus yard ops, and 2.8 MW for BEB charging. The connected load is higher than the peak load for BEBs because automatic load management systems should be used per NEC code Article 625 section 42.

# Hetch Hetchy POWER

## APPLICATION FOR ELECTRIC SERVICE

Refer to the [Application Checklist](#) to complete this form. Submit separate forms for temporary construction power and permanent power.

This application covers the bus facility load and a portion of the battery electric bus charging load. NFPA70 Article 625 Sec42 states automatic load management system can be used for feeder rating. Based on modeling, estimated peak load with load management is 9,941kW. Designs include automatic load management and intelligent switchgear that can function as a backup to the load management limiting peak demand to 9 941kW. Second service requested for remainder of chargers

**Acknowledgement**

The applicant hereby applies to the SFPUC for electric service. Applicant acknowledges that this Application is subject to the SFPUC's *Rules and Regulations Governing Electric Service* that can be found at <https://sfwater.org/ElectricRules> .

By clicking "Submit" below, I agree that the information contained in this Application is correct to the best of my knowledge. I understand that any changes made to the above information or attached documents may increase the time and costs required for SFPUC to provide electric service at the requested service address and that I will be responsible for any increased costs resulting from such changes.

I understand that service will be engineered and installed based in part upon the information provided here. The SFPUC will provide the Applicant with a service agreement estimating the Applicant's cost responsibility. Subject to entering into a service agreement with the SFPUC, I agree to pay SFPUC for all work SFPUC performs and all costs SFPUC incurs to provide the service requested by this Application. SFPUC may cancel this project if I do not proceed with the project and it becomes inactive for 12 months. If the project is cancelled, by either party, I will pay SFPUC for all such work and costs incurred by SFPUC prior to the cancellation.

I have read and agree to the terms above.

## 2. FEEDER 2 APPLICATION (MIXED USE LOAD)

This application covers housing and retail loads and a portion of the battery electric bus charging load. NFPA70 Article 625 Sec42 states automatic load management system can be used for feeder rating. Based on modeling, estimated peak load with load management is 2.8MW BEB chargers. New service estimate 5MW commercial, 3MW residential and 2.8MW BEB Chargers. Designs have automatic load management & intelligent switchgear that function as backup limiting peak demand to 10.8MW.

The total peak BEB charging load is ~12.7MW, split between two feeders. Feeder 1 is all BEB and anticipated to peak around 9.9 MW. Feeder 2 is mixed between BEB charging, residential, bus operations, and commercial uses. This totals 3MW peak for residential, 5MW for commercial/bus yard ops, and 2.8 MW for BEB charging. The connected load is higher than the peak load for BEBs because automatic load management systems should be used per NEC code Article 625 section 42.

**Ramp Up Schedule**

When will the load reach the below percentages of total forecast?

	Estimated Week from Service Energization:
25% of Electrical Load	<input type="text" value="4"/> *
50% of Electrical Load	<input type="text" value="8"/> *
75% of Electrical Load	<input type="text" value="12"/> *
100% of Electrical Load	<input type="text" value="104"/> *

**Street/Sidewalk Improvement**

Does the project include any street/sidewalk improvement along public streets?

- No
- Yes

If yes, contact slengineering@sfwater.org .

**Customer Self Generation and Net Energy Metering**

This Application form is for electric service only. The installation and interconnection of self-generation equipment, including photovoltaic systems, requires the submission of an interconnection application and SFPUC approval. Please contact hhpower@sfwater.org for more assistance.

Do you plan to install onsite self-generation equipment?

- Yes
- No

Generation type:

Total output in kWAC

**Attachments**

**A. Site Plan(s)**

Drawn to scale, indicating proposed locations of electric metering (including any sprinkler controller meter), switchgear, and (if applicable) transformers. Show easements, rights-of-way, property lines, grading, roads, road names, sidewalks, driveways. Indicate location of fire hydrants and other structures, drains (water, sewer, storm) and proposed future improvements. **Minimum 300 dpi, include relevant directional, scale, legend, and context information.** Upload at least one file. \*

Additional information, such as existing active WDT Application

NOTE: This application covers housing and retail loads and a portion of the battery electric bus charging load. NFPA70 Article 625 Sec42 states automatic load management system can be used for feeder rating. Based on modeling, estimated peak load with load management is 2.8MW BEB chargers. New service estimate 5MW commercial, 3MW residential and 2.8MW BEB Chargers. Designs have automatic load management & intelligent switchgear that function as backup limiting

**Acknowledgement**

The applicant hereby applies to the SFPUC for electric service. Applicant acknowledges that this Application is subject to the SFPUC's *Rules and Regulations Governing Electric Service* that can be found at <https://sfwater.org/ElectricRules> .

By clicking "Submit" below, I agree that the information contained in this Application is correct to the best of my knowledge. I understand that any changes made to the above information or attached documents may increase the time and costs required for SFPUC to provide electric service at the requested service address and that I will be responsible for any increased costs resulting from such changes.

I understand that service will be engineered and installed based in part upon the information provided here. The SFPUC will provide the Applicant with a service agreement estimating the Applicant's cost responsibility. Subject to entering into a service agreement with the SFPUC, I agree to pay SFPUC for all work SFPUC performs and all costs SFPUC incurs to provide the service requested by this Application. SFPUC may cancel this project if I do not proceed with the project and it becomes inactive for 12 months. If the project is cancelled, by either party, I will pay SFPUC for all such work and costs incurred by SFPUC prior to the cancellation.

I have read and agree to the terms above.

## 5. FLOOR PLAN

**REVISION NOTES:**  
 1) RENAMED INTERRUPTER SWITCH LOCATIONS FOR CLARITY  
 2) PRIMARY METERS TO BE LOCATED IN MAIN SWITCHGEAR IN MAIN ELECTRICAL ROOM  
 3) THERE ARE A TOTAL OF FOUR (4) UNDERGROUND VAULTS NEEDED FOR ELECTRICAL SERVICE. THERE ARE TWO (2) NEW SERVICES PLANNED AND EACH SERVICE REQUIRES TWO (2) INTERRUPTER VAULTS: ONE FOR THE PG&E INTERRUPTER AND ONE FOR THE SFPUC INTERRUPTER.  
 4) INTERRUPTER VAULT LOCATIONS ARE FIXED. LOCATION OF ALL ELECTRICAL WORK DOWNSTREAM OF THE INTERRUPTERS, INCLUDING THE LOCATION OF THE MAIN ELECTRICAL ROOM, IS AT THE DISCRETION OF THE DESIGNER.

APPENDIX F:  
SECURITY SENSITIVE INFORMATION  
PROCESS REGARDING TRACTION POWER  
STANDARD SPECIFICATIONS

**SFMTA POTRERO YARD MODERNIZATION PROJECT**  
**SENSITIVE SECURITY INFORMATION CONFIDENTIALITY**  
**AND NONDISCLOSURE AGREEMENT**

**RECITALS**

- A.** On November 2, 2022, the City and County of San Francisco, through its Municipal Transportation Agency (SFMTA), and Potrero Neighborhood Collective LLC, a limited liability company organized under the laws of the State of Delaware (Lead Developer) entered into an agreement for predevelopment services (Predevelopment Agreement) for the SFMTA Potrero Yard Modernization Project (Project).
- B.** The Project is a joint development project that includes the design, construction, financing, operation, and maintenance of an infrastructure facility to be comprised of at a transit facility for the SFMTA's fleet of electric trolley buses (Bus Yard Component) and common infrastructure to be shared by the Bus Yard Component and a housing and commercial component or other use.
- C.** The SFMTA wishes to share with Lead Developer certain drawings and specifications related to the SFMTA's traction power system and related design elements, which are marked as "Sensitive Security Information" or "SSI Documents" are confidential and protected from public disclosure under federal law. See 49 CFR Parts 15 and 1520; Lead Developer requires these SSI Documents for design work on the Project's Bus Yard Component.
- D.** The disclosure of SSI Documents to unauthorized persons is a violation of federal law, may cause irreparable damage to the SFMTA, and may threaten or compromise the security of the traveling public, transit employees, or transit infrastructure.
- E.** SFMTA will make available SSI Documents in connection with the Project to Lead Developer (SSI Recipient), subject to the following terms and conditions.

**AGREEMENT**

- 1. Acknowledgment.** By signing this Agreement, SSI Recipient acknowledges that the disclosure to the public of any documents denoted as SSI would cause security risks that may cause irreparable damage to the SFMTA, and may threaten or compromise the security of the traveling public, transit employees, or transit infrastructure. The SFMTA will make the following SSI Documents available to the SSI Recipient:
  - 1. Sample construction specification 16121 – Traction Power Cable, August 2023
  - 2. Sample construction specification 16180 – DC Trolley Switch and Catenary Detection, August 2023
  - 3. Sample construction specification 16312 – Traction Power Substation, August 2023
  - 4. Sample construction specification 16790 – Traction Power SCADA System, August 2023
  - 5. Central Subway Chinatown Station Drawings, dual feed traction power substation, 2012
  - 6. King Substation Upgrade Drawings, single feed traction power substation, 2017
  - 7. King Substation Upgrade construction specifications, traction power substation upgrade, 2017
  - 8. King Substation Upgrade, surge arrest final design, 2022

- 2. Agreements.** By signing this Agreement, SSI Recipient agrees to the following:
- 2.1. Non-Disclosure of SSI Documents.** SSI Recipient shall not disclose to any person or firm any SSI Document without the prior express written consent of the SFMTA, which consent shall be by Kerstin Magary, Section Director, CSO Facilities and Real Property Manager or her designee, and without such person or firm executing a Confidentiality and Nondisclosure Agreement attached as Exhibit A to this Agreement.
  - 2.2. Use of SSI Documents.** SSI Recipient shall use SSI Documents provided by the SFMTA only for the following purpose: to assess whether they are applicable to be incorporated into the Project's bus yard infrastructure, and if so, to then incorporate them into the design of the Bus Yard Component.
  - 2.3. Reproduction and Cover/Removal of Markings Prohibited.** SSI Recipient shall not copy or otherwise reproduce SSI Documents without express written authorization from the SFMTA. SSI Recipient shall not cover, remove or otherwise hide from display markings identifying SSI Documents as Sensitive Security Information.
  - 2.4. Safeguards Against Unauthorized Disclosure of SSI.** With respect to SSI, SSI Recipient shall implement the following safeguards and procedures to prevent the unauthorized disclosure of SSI. SSI Recipient shall designate a responsible managing employee or responsible managing officer as its Sensitive Security Information Handler (SSIH), who shall ensure that all safeguards are maintained, including the following:
    - (a)** Ensuring that the SSI Documents are properly marked as required under federal law.
    - (b)** Providing authorized employees and consultants adequate instructions with regard to the use and disclosure of SSI, including obtaining the employees' signed Confidentiality and Nondisclosure Agreement forms (Exhibit A).
    - (c)** Implementing safeguards to restrict copies and reproductions of SSI in any form, including, but not limited to, paper copies and electronically formatted copies. SSI Recipient's SSIH shall authorize copies of portions of SSI only on a need-to-know basis, as determined by SFMTA, and shall retrieve all such copies upon completion of the task for which they were required. Copies and reproductions of SSI shall not be made for or retained for distribution to any third party unless the third party has complied with the requirements of Section 2.1. SSI Recipient shall identify each copy of SSI released by copy number and maintain a record of all copies of SSI released to employees and third parties on the Log of Copies of SSI provided as Exhibit B.
- 3. SSI Documents Taken Off SFMTA Premises.** If the SFMTA provides SSI Recipient copies of SSI Documents and allows said documents to be removed from SFMTA premises, the SSI Recipient shall maintain said documents in a secure location and shall use them only for the purposes described in this Agreement. Upon request of the SFMTA, SSI Recipient shall certify that all SSI Documents have been returned to the SFMTA or destroyed by shredding.
- 4. Unauthorized Disclosure or Loss of SSI Documents.** SSI Recipient agrees that if at any time he/she misplaces or loses control over SSI Documents in his/her custody or inadvertently provides access to persons or parties not authorized by the SFMTA to receive SSI Documents, the SSI Recipient shall notify the SFMTA immediately (i.e., no later than 24 hours) upon discovery that an unauthorized disclosure or loss of control of SSI Documents has occurred. Such notice shall be given orally and in writing, and shall provide all details that are available regarding the event. The oral notices shall be given by telephone to

Kerstin Magary at (415) 608-3004. The written notices shall be mailed to Kerstin Magary at the SFMTA address listed in paragraph 10, below. The SFMTA will investigate the facts underlying SSI Recipient's disclosure or loss of control over SSI Documents. In the event that the SFMTA determines that such unauthorized disclosure or loss of control constituted an unauthorized disclosure or improper use of SSI Documents by SSI Recipient, the SFMTA may pursue remedies as set forth in Section 6.

5. **Ownership of Sensitive Security Information.** Recipient agrees that all SSI Documents provided to the SSI Recipient will at all times remain the property of the SFMTA, which retains all rights to them.
6. **SFMTA Remedies.** SSI Recipient acknowledges that the unauthorized disclosure or improper use of SSI Documents by Recipient may cause irreparable harm to the SFMTA and the public. The SFMTA retains all of its legal rights and remedies to enforce this Agreement. Furthermore, SSI Recipient acknowledges that the SFMTA is entitled to seek equitable remedies, including temporary and permanent injunctive relief, without the necessity of posting a bond or other security, to enforce this Agreement. No remedy or election under this Agreement shall be deemed exclusive but shall, whenever possible, be cumulative with all other remedies at law or in equity.
7. **Attorneys' Fees.** In the event that a suit or other legal action is necessary to enforce any of the provisions herein contained, the prevailing party shall be entitled to reasonable attorneys' fees in addition to costs.
8. **Assignment.** SSI Recipient shall not assign any rights or transfer any obligation under this Agreement without the express written consent of the SFMTA.
9. **Severability.** Should the application of any provision of this Agreement to any particular facts or circumstances be found by a court of competent jurisdiction to be invalid or unenforceable, then (a) the validity of other provisions of this Agreement shall not be affected or impaired thereby, and (b) such provision shall be enforced to the maximum extent possible so as to effect the intent of the parties and shall be reformed without further action by the parties to the extent necessary to make such provision valid and enforceable..
10. **Notices.** All written communications sent by the parties may be by U.S. mail, e-mail or by fax, and shall be addressed as follows:

To SFMTA:

Kerstin Magary  
Section Director, CSO Facilities and Real Property Management  
1 South Van Ness Ave., 8th Floor, #8191  
San Francisco, CA 94103  
Kerstin.Magary @sfmta.com

To SSI Recipient:

Name:  
Address:  
Phone:  
Email:

Any notice of default must be sent by registered mail or by personal service.

11. **Applicable Law.** This Agreement shall be governed by, and construed and interpreted in accordance with the laws of California. Venue for any action arising from this Agreement or related thereto shall be in courts located in San Francisco, California.

**12. Successors.** This Agreement shall be binding on and inure to the benefit of SSI Recipient's successors or assigns.

IN WITNESS WHEREOF, the SSI Recipient has caused this Agreement to be duly executed in San Francisco, California.

I agree that any disclosure to me of information designated as Sensitive Security Information pertaining to the San Francisco Municipal Transportation Agency (SFMTA) SFMTA Potrero Yard Modernization Project (the Project), will be subject to the following obligations:

1. I have received, read, and understand: (1) FTA Resource Document for Transit Agencies – SSI Designation, Markings, and Control; and (2) TSA Sensitive Security Information Best Practices Guide for Non-DHS Employees and Contractors.
2. I confirm that I have been provided a copy of the Confidentiality Agreement between the SFMTA and SSI Recipient. I confirm that I will comply at all times with the SSI Recipient’s obligations in relation to the SSI Documents as set out in the Confidentiality Agreement, and will not do anything that would or could jeopardize any of the SSI Recipient’s obligations in relation to the SSI Documents, or lead to a breach or compromise of the security of the SSI Documents.
3. I will not disclose or permit disclosure of the SSI Documents, or permit anyone to use the SSI Documents, without the prior written approval of the SSI Recipient’s Sensitive Security Information Handler and the SFMTA.
4. The above obligations of confidentiality and non-use will apply to my work on the Project, and will continue to apply without limitation of time after the date of termination of my work.

APPENDIX G:  
DESIGN CRITERIA PARATRANSIT  
(FOR REFERENCE)

FOR REFERENCE ONLY

## SPACE NEEDS PROGRAM

**1.0 Introduction**

This section presents the Space Needs Program for the SFMTA Paratransit. The Space Needs Program illustrates the space requirements for efficient operations. The program is summarized at the end of this section, which includes projected square footage needs for building areas and exterior areas. These projected space needs are subtotaled to include site access, landscaping, and setbacks for total site acreage requirements.

**1.1 Staff Summary**

Facility staffing levels are crucial to planning efforts when determining the number of parking spaces, size of support facilities, and developing occupancy levels. Table 1.A is the summary of facility staffing levels for each scenario.

**1.2 Vehicle Parking Summary**

The following Table 1.B is the summary of vehicles for each scenario.

TABLE 1.A - PARATRANSIT - STAFF SUMMARY

Scenario 1A New Facility	
Function	Staff
Maintenance	23
Operations	27
<b>TOTAL</b>	<b>50</b>

TABLE 1.B - PARATRANSIT- VEHICLE SUMMARY

Scenario 1A New Facility	
Function	Number of Spaces
Cutaway Buses	150
Vans	10
<b>TOTAL</b>	<b>160</b>

## SPACE NEEDS PROGRAM

**1.3 Rule of Thumb Planning Ratio**

The table lists the key planning ratios. Information taken from *2017 SFMTA Facilities Framework Addendum*, published October 2017.

TABLE 1.C	
SPACE	RATIO OR SPACE STANDARDS
Maintenance Repair Bay (20' x 40')	1 bay for every 20 buses to be maintained
Chassis Wash Bay (25' x 40')	1 bay for every 150-200 buses to be maintained
Brake Shop	5 SF per bus
Tire Storage	5 SF per bus for 1 tire per bus
Parts Storage	20 SF per bus with High Density Storage System
*SQUARE FEET (SF)	

## SPACE NEEDS PROGRAM

## 1.4 Space Standards

Space standards were applied to the Space Needs Program and generally apply to the Offices, Shops, Bays, and Vehicle Parking Areas. Area requirements in Shops and Storage Areas were derived from functional requirements and equipment space needs. The space standards listed below were utilized to develop the facility program and overall area requirements. The space standards are based on functional needs and requirements established through the design of other facilities, rules of thumb, and specific requirements of each functional group.

TABLE 1.D	
AREA	SIZE
<b>SHOP:</b>	
Common Work Area	300 SF
Portable Equipment Storage	200 SF
Lube Room	200-300 SF
Compressor Room	200 SF
<b>PARKING:</b>	
Cutaway Buses	324 SF (12 x 27)
Vans	200 SF (10 x 20)
Large Non- Revenue Vehicles	420 SF (12 x 35)
Standard Non-Revenue Vehicles	200 SF (10 x 20)
<b>CIRCULATION:</b>	
Aisles for 90 degree turns	40' turning into parking lanes or service
Aisles for 90 degree turns	50' turning into maintenance bays
Forklift Circulation	10' wide
*SQUARE FEET (SF)	

## SPACE NEEDS PROGRAM

### 1.5 Circulation Factors

The space requirements shown for each function are net usable area. By using the urban design approach to this development of the facility, the Project Team hopes to minimize the amount of circulation necessary for an efficient facility. Interior or Building Circulation is the only applicable circulation factor for the SFMTA facilities.

### 1.6 Interior or Building Circulation

This factor is applied to the program as a percentage of the total building square footage. It accounts for miscellaneous building spaces such as hallways, stairwells, custodial closets, mechanical, plumbing, and electrical rooms, wall thickness, structure (Circ/Mech/Elec/Struct - Net:Gross), and access requirements. The following is a list of the factors (in general) that have been applied to the program:

- Bays, Shops, & Parts 40%
- Maintenance 40%
- Operations 40%

### 1.7 Parking Circulation

This factor is included to account for the drive aisles, walkways, islands, and other areas created by site and access inefficiencies. This factor can vary from 15% to 100% of the actual space occupied by a vehicle. For this project the following factors were applied:

- Vehicle parking areas 75%

### 1.8 Space Needs Program & Summary

A summary of the Space Needs Program for each of the three scenarios is provided on the following pages. The summary tables include projected square footage needs for building areas, parking, and staff totals.

These projected space needs are subtotaled into net square footage requirements.

The detailed Space Needs Program begins with the identification of each space by name and a space standard (if applicable). The space column represents spaces required to accommodate the fleet inclusively and operation for the Final build out.

## SPACE NEEDS PROGRAM

TABLE 1.E - P A R A T R A N S I T

Function	Space Standard			Staff or Vehicles	Number of Spaces	Unit Size (sf)	Subtotal (sf)	Comments
<b>P A R K I N G</b>

<b>Vehicle Circulation</b>					<b>43,550</b>	
<b>PARATRANSIT SUBTOTAL</b>					<b>75,800</b>	

**DESIGN CRITERIA NARRATIVE**

**2.1 Purpose & Intent**

The purpose of this section is to define goals that were developed throughout the SFMTA Planning Study. Guided by planning, compliance, and general site criteria, simple narratives are included to provide an overview of specific systems and assemblies that the facilities will require. The intent of these narratives is to present SFMTA and client representatives an easy to understand, non-technical explanation of how this facility is proposed to function, and includes considerations from employee and stakeholder input during the Design Charrette (January/February 2018).

**2.2 Planning Criteria**

The following, Table 4.2, is a general description of the planning objectives, building quality, and transit specialty needs for paratransit facilities.

TABLE 2.A - PLANNING CRITERIA

Design Life	75 years
Quality	The planning, design, and construction of the facility shall be high quality and long-lasting, have the necessary spaces and systems to function well, provide a safe and healthy work environment, and be economical and resource efficient to operate and to maintain.
Planning	The facility layout shall have a logical and efficient organization and flow to allow easy and safe access and circulation for staff, vehicles, and service providers. The layout shall be open and modular with the structure located to support building and equipment loads.
Flexibility	The facility shall be designed to be flexible. Vehicle parking, service, and maintenance spaces shall have an open and modular layout to accommodate paratransit vehicles. Staff areas shall be designed with an open plan with modular partitions and furnishings that can accommodate staffing and programming needs over time.
Space Utilization	The facility shall include all required spaces and assignable square footages (area inside room or boundary) in Section Two of the Facility Program as well as minimum dimensions and clearances as defined in the Space Standards. Vehicle areas shall be planned to maximize fleet capacity, sharing where possible circulation between functions such as parking and maintenance bays.
Workspace	Workspaces shall be designed based on needs to be highly functional spaces with quality environments that support staff health, safety, and productivity with good lighting, good ventilation, and durable finishes.
Safety	The facility shall have the best practice safety features including fire life safety systems; adequate means of egress and wayfinding components to exit discharge; fall protection; eye and ear protection; unobstructed circulation and equipment clear space; easy to use fluids collection; and good ventilation with positive pressure in staff areas
Security	The facility shall have passive and active security. The site shall have limited vehicular and pedestrian entries that are easy to find and visible. The facility shall have card readers at all exterior entries, suite entries, and support spaces. Security camera system shall be installed to monitor all exterior access and interior areas.

**DESIGN CRITERIA NARRATIVE**

**2.3 Compliance**

The Paratransit Facility shall comply with all applicable governing codes and ordinances that regulate building construction, site design, life

safety, fire protection, accessibility, energy, and environmental requirements as follows (or those which are applicable at the time the design is initiated):

**TABLE 2.B - BUILDING CODE & ZONING REQUIREMENTS**

Authority Having Jurisdiction:	City and County of San Francisco
Zoning Code:	San Francisco Municipal Code
Applicable Codes (Adopted):	2016 California Building Standards Code (2016 International Code Council) California Residential Code (2015 International Residential Code) California Electrical Code (2014 National Electrical Code) California Mechanical Code (2015 Uniform Mechanical Code) California Plumbing Code (2015 Uniform Plumbing Code) California Existing Building Code (2015 International Existing Building Code) California Energy Code California Historical Building Code California Fire Code California Green Building Standards Code California Reference Standards Code 2016 San Francisco Code Amendments, State Amendments, Ordinances, and Law
OCCUPANCY GROUP	S-2, B, R-2

**CONSTRUCTION TYPE/ HEIGHT & AREA (ICC TABLE 504.3) SEE ALSO ICC TABLE 503**

Type I-B Max.	150'-0" / _ Floors @ _SF ea. Per ICC 2016; 85' per San Francisco Municipal Code
FIRE PROTECTION:	Sprinkler System
(PLANNED) ZONING/ F.A.R.	UMU (Urban Mixed-Use)/ 6.0 to 1 (currently zoned as Public)

**AREA CALCULATIONS (IF @144'-0" TO PARAPET)**

Space	Occupancy Group	Existing	Demo	Renovation
Garage, Training/ Operations	S-2, B			
Joint Development	R-2			
<b>TOTALS</b>				

**FIRE RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS, FOR TYPE 1-B CONSTRUCTION (ICC TABLE 601)**

Structural Frame Including Columns, Joists, & Girders	Supporting Floors - 2 hours
---	-----------------------------

**DESIGN CRITERIA NARRATIVE**

**TABLE 2.B (CONT.) - BUILDING CODE & ZONING REQUIREMENTS**

	Supporting Roof ONLY - 1 hour
Bearing Walls Exterior	(per ICC Table 602) - 2 hours
Bearing Walls Interior	Supporting Floors - 2 hours
	Supporting Roof ONLY - 1 hour
Non-Bearing Walls & Partitions Exterior	(per ICC Table 602) - 1 hour
Floor Construction Including Supporting Beams & Joists	2 hours
Roof Construction Including Supporting Beams & Joists	2 hours

**OCCUPANCY SEPARATION, FIRE BARRIERS, FIRE PARTITIONS, & REQUIRED OPENING PROTECTIVES, FOR TYPE I-B CONSTRUCTION (ICC TABLE 504.3, TABLE 504.4, TABLE 716.5)**

	PARTITIONS	OPENINGS
Occupancy Separation between (S-2, Bus Repair Garage) & (B, Training Area, Operations)	2 hours	
Occupancy Separation between (S-2, Bus Repair Garage) & (R-2, Residential T.O.D.)	2 hours	
Exit Passageways	1 hour	1 hour
Exit Enclosures	1 hour	1 hour
Vertical Shafts (for 14 stories, 144'-0" total height)	1 hour	1 hour

**INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY (SPRINKLERED BUILDING), FOR TYPE I-B CONSTRUCTION (ICC TABLE 803.11)**

Occupancy Group	Exist Enclosures & Exit Passageways	Corridors	Rooms & Enclosed Spaces
S-2	Class C	Class C	Class C
B	Class B	Class C	Class C
R-2	Class C	Class C	Class C

## DESIGN CRITERIA NARRATIVE

**2.4 General Site Requirements**

There are specific site requirements necessary to ensure safe, efficient, and functional facilities. These specific requirements are outlined (and not limited to) the following:

GENERAL SITE REQUIREMENTS	
Site Accessibility	Provide a minimum of two vehicular entries/exits configured such that either could work as the entry/exit in the event that the other is unavailable
Site Lighting	Use appropriate and adequate lighting for typical operations and to ensure high level of surrounding visibility
Pedestrian Safety & Accessibility	Observe all code and regulation requirements to insure safe and defined pedestrian circulation paths (necessary striping, bollards, curb cuts, etc.); and that paths minimally intersect fleet ingress and egress
Site Stormwater Drainage	Positive drainage and appropriate stormwater discharge from site and upper exterior/open decks; a stormwater management and pollution prevention plan shall be established
Sustainability	Provide as required including CALGreen, LEED Gold requirements detailed in Chapter Seven of the Environmental Code of the City and County of San Francisco
Parking	(Employee Parking will not be provided)
Security	Provide site video surveillance and building security

## DESIGN CRITERIA NARRATIVE

**2.5 Architectural Narrative**

The Paratransit Facility is intended to service, maintain and store a fleet of cutaway buses and vans. It consists of Bays & Shops, Maintenance, and Operations.

**2.5.1 Site**

The current Potrero Yard and Garage Facility, located on a city block bound by Mariposa Street to the south, 17th Street to the north, Hampshire Street to the east, and Bryant Street to the west, sits at the edge of the Mission District and Potrero Facility Hill. The site is currently zoned as P (Public), with adjacent sites having the zoning designations as PDR-1 (Production, Distribution, and Repair Businesses) and UMU (Urban Mixed Use). Through discussions with Planning, it has been agreed upon that we will use UMC (within the Eastern Neighborhoods District MUD (Mixed Use Development)).

The New Facility site, located between McKinney Avenue and Kirkwood Avenue, with Highway 280 running between the New Facility and adjacent trucking operations. The site is currently zoned as Industrial.

**2.5.3 Planning/Programming**

Following the release of the 2017 SFMTA Facilities Framework to address facility needs in January 2017, an Addendum was later released describing the SFMTA's pared down, refined scenarios to address its facility needs. The Framework included five scenarios, which were later narrowed to three with Paratransit included.

**2.6 Structural Narrative**

The Potrero and New Facility Yard Reconstruction project will require several considerations in the appropriate selection of a structural system. Given the long spans of the Bus Garage & Maintenance Facility and the load requirements for the residential development above, a post-tensioned, cast-in-place concrete beam and slab system with concrete shear walls for resisting lateral loads are appropriate.

A separate geotechnical investigation will be required depending on location. Final Design will be responsible for geotechnical analysis.

**2.7 Mechanical Narrative***General HVAC:*

Supply, exhaust, and return ducts shall be designed with a maximum of 0.06-inch water gauge static pressure drop per 100 feet of duct. Supply ductwork serving mechanical air conditioning will be insulated. Exposed ductwork will be round, uninsulated and suitable for painting.

Seismic-restraint systems shall comply with CBC requirements.

**2.7.1 Operations Areas**

The operations portion of the facility will include heating and air conditioning capabilities. Zoning will be determined by essential and non-essential personnel. No more than three offices per thermostat. Ventilation will be in accordance with ASHRAE 62.1.

Exhaust will be included for locker rooms,

restrooms, kitchen/breakrooms and janitorial areas. A minimum of 0.50 to 1.0 CFM per square foot exhaust is recommended for these types of spaces.

**2.7.2 Maintenance Areas**

Filtered and heated ventilation supply air distribution system, plus exhaust will serve the maintenance areas.

Vehicle maintenance and enclosed parking areas will maintain 0.75 to 1.0 CFM per square foot at all times in accordance with CFC, CMC and NFPA. Enclosed parking areas will have exhaust grilles within 18-inches of finished floor every 50 feet along perimeter in accordance with CMC Article 403.7.2.3 requirements. Additional exhaust grilles within 18-inches of the ceiling structure for capture of H<sub>2</sub> gases is also required.

**DESIGN CRITERIA NARRATIVE**

Upon detection of CO, NO<sub>2</sub>, and/or H<sub>2</sub>, exhaust rate will immediately increase to achieve 4 air changes per hour for 10 minutes after CO, NO<sub>x</sub> and/or H<sub>2</sub> detection system readings return to normal levels.

Exhaust fans serving enclosed parking areas will be rated for Class 1, Div. 2 hazard classification and have control dampers. Fans shall be capable of exhausting ten air changes per hour when CO, NO<sub>2</sub> and/or H<sub>2</sub> levels exceed 20% LEL.

**2.8 Plumbing Systems**

Domestic and fire protection water will be provided to the building from a water line extended from the site service connection. A strainer, lead-free reduced pressure backflow and utility grade remote reading water meter will be provided on domestic water lines serving the building. The backflow relief will discharge outside of the building.

The building domestic water service will be a complete connection to the existing street water main. Pipe sizing inside of the building shall comply with the requirements in the CPC and a maximum system piping loss to provide a 10% pressure safety factor at full system flow. Velocities within any main or branch of the piping shall not exceed seven feet per second (FPS). Interior domestic water piping above grade will be Type L copper with copper solder- or pressure-sealed joints. All buried domestic water pipe below slab will be protected with 20 mil polyethylene tape and pipe sleeve at slab penetration.

The supply line to each item of equipment or fixture shall be equipped with a shutoff valve to enable isolation of the item for repair and maintenance without interfering with operation of other equipment or fixtures. Water hammer arrestors will be in accessible location, on the domestic water piping system where shock pressures could occur. Water hammer arrestors will be PDI-WH 201 certified.

A high efficiency domestic water heating system will be provided with hot water recirculation. Per CALGreen standards, a recirculation pump with timer are required to provide sufficient hot water throughout the facility. A thermostatic mixing valve will be installed on hot water systems. Domestic hot water system to be provided with thermal expansion tank, and re-circulating pump, for hot water return system.

All hot water piping shall be insulated. High-efficiency, low-flow plumbing fixtures will be employed throughout the building to meet CALGreen's current standards. ADA-compliant electric water coolers and toilet room fixtures will be incorporated.

Water closets will be low flow, vitreous china, siphon jet, 1.28 gallon per flush (maximum); commercial seat with self-sustaining check hinge. Ultra-low flow vitreous urinals (0.125 GPF).

Lavatories will be under-counter or wall-hung mounting, with deck mounted, hydraulic powered, 0.35 GPM infrared faucets, with sensor under spout.

Floor mounted mop basin of molded stone with

wall-mounted chrome-plated service sink faucet with vacuum breaker; ADA compliant handles with maximum flow rate of 2.0 GPM. Break (coffee) and kitchen area sinks will be stainless steel, with a 1.5 GPM single lever faucet and a half-horsepower garbage disposal.

A gravity sanitary lateral will handle all levels, except the basement. The basement will have a sewage ejection system consisting of a sump tank, duplex ejectorpumps and pits sized to unit pump to a maximum of six starts per hour. Ejector pumps will be connected to standby power. Sanitary waste will discharge to the street main.

All industrial waste and covered parking decks will drain to an appropriately sized oil/water interceptor prior to connecting to the municipal sanitary system.

The storm water system will consist of area drains, roof drains and over-flow drains.

**2.9 Fire Protection Systems**

Integrate all requirements and criteria for safety, security and reliability to design, furnish, and install a complete fire protection system. Establish the hazard and coverage requirements for fire protection systems in conjunction with the City and authority having jurisdiction (AHJ). Provide fire suppression systems in compliance with NFPA 13, 14, 30A, and 88A. The need for a fire pump will be determined by the fire suppression designer. Fire protection system will be design delegated to a licensed contractor. The system will be hydraulically calculated.

## DESIGN CRITERIA NARRATIVE

Sprinkler system occupancy hazard classification, minimum density and maximum sprinkler spacing and standpipe requirements shall be determined in concert with the authority having jurisdiction (AHJ) and using NFPA 13 and 14 guidelines. Current street hydrant flow test data will need to be determined.

### 2.9.1 Mechanical Sustainable Design Systems

Sustainable design requirements and best practices will be complied with, adopted, and implemented where such requirements are promoted by the United States Green Building Council (USGBC), as defined under the published LEED Standards. Code required restrictions placed on the use and quantities of toxic and/or environmentally deleterious substances such as Volatile Organic Compounds, (VOCs), that are components in certain sealants and construction materials, and on the use of HCFC refrigerants in HVAC systems, are specific examples of applicability of such sustainable-based Code design requirements.

An energy model will be required based on performance approach to confirm compliance with CALGreen requirements.

Heating and cooling load calculations for the industrial areas will be performed in accordance with LEED, CALGreen, and Climate Zone 3. The design of the mechanical ventilation systems, heating systems and cooling systems will comply with the respective requirements of the CMC, ASHRAE Standards of Indoor Air Quality and Thermal Comfort, and CALGreen where applicable.

### 2.10 Electrical

*Governing Codes, Acts, and Guidelines:*  
Applicable Codes and Standards include: NFPA 70 NEC, California Building Code with Local Amendments, and California Green Building Standards with Local Amendments. Seismic-restraint systems shall comply with California Building Code requirements.

The building and electrical systems shall be designed in compliance with LEED GOLD Certification.

#### 2.10.1 Systems Overview

Basic electrical systems for the SFMTA Potrero and New Facility Yards will include powering the mechanical systems, maintenance equipment, convenience receptacle power, interior and exterior lighting systems with controls, and an addressable fire alarm system.

#### 2.10.2 General Building Requirements

Basic Electrical Systems for the building, mechanical systems and other miscellaneous equipment; convenience receptacle power; and interior and exterior lighting systems with controls.

The utility will bring Medium-voltage power at approximately 15,000 VAC to feed the facility transformer. The transformer will step down the voltage to 480 volts.

Power for the facility will be 480Y/277V, 3 phase, 4 wire, with solid neutral. All large equipment will be served at the highest voltage possible, 480 volt

three phase. All equipment will be coordinated to ensure the utilization equipment will be served at their required voltage.

The electrical distribution system will be set up to comply with LEED. Loads will be segregate the load by type; life safety, lighting, and mechanical equipment. Meters to verify the load for each of these loads types will not be initially installed, however it would be a simple task to add them in the future.

CALGreen receptacle control will be achieved by tying receptacle control devices into the lighting system control panel. The Lighting System occupancy sensors will be utilized to turn off, 50% of the receptacles within a room when the room is not occupied.

A fully addressable fire alarm system will be provided for the facility. The fire alarm system shall contain pull stations, smoke detectors, heat detectors, duct detectors for the HVAC system, monitor the buildings sprinkler system, and provide occupant notification in the case of a fire event. Premise monitoring will be provided by an off-site entity.

#### 2.10.4 Lighting

*Interior Lighting:*

Lighting Systems for the facilities will utilize LED light sources. Dimmable drivers will be specified for the LED drivers. Daylight harvesting will be utilized wherever practical. Daylight sensors will be installed to allow the dimming of the LED lights when there is enough natural daylight within the space.

## DESIGN CRITERIA NARRATIVE

Occupancy and vacancy sensors will be incorporated into a low voltage lighting control system for all interior and exterior lighting systems. All offices and small room shall be provided with occupancy sensor(s) as required for full room coverage. The facility lighting control shall operate on the following properties:

- An addressable lighting control system shall be provided. The system shall be programmed with normal building operational hours and shall turn the lights on and off in compliance with the hours of operation.
- All offices, bathrooms, back of house spaces, and other rooms shall be provided with occupancy sensors. All regularly occupied spaces shall be provided with vacancy sensors, all other spaces shall be provided with occupancy sensors. All sensors shall turn off the lights 5 minutes after no occupancy.
- All areas with natural daylight shall be provided with daylight harvesting. Once the sensor picks up there is enough daylight within a space the lighting control system shall dim the LED luminaires. The luminaires shall be dimmed to a minimum level of 10% while maintaining design footcandle levels.

*Exterior Lighting:*

Site lighting fixtures will be an LED light source. The fixtures will be controlled by a programmable low voltage lighting control panel. Luminaires shall be provided with occupancy sensors. The use of occupancy sensors in the exterior luminaires is suggested. The proposed control of the exterior lighting shall be:

- An addressable lighting control system shall be provided. The system shall be programmed with normal exterior lighting hours, on at dusk, off at

dawn.

- After 11:00 P.M. the luminaires shall reduce to 25% light output. If the luminaire senses motion, the luminaires shall increase brightness to full bright. After 10 minutes of no motion the luminaires shall drop back down to 25%.

**2.10.5 Emergency Power**

The sites will be provided with an emergency generator. It is anticipated that the generator will provide to allow the facility to operate, but not at full capacity, in the event of a power outage/emergency. The exact size of the generator has not yet been finalized. Coordination efforts with the SFMTA staff is required to ensure the generator will allow the facility to operate as the staff requires size to be determined in Final Design.

The code required emergency power for the lights will be provided with either internal battery back-up or a battery backed up inverter. These batteries will provide the code required back-up power. Some luminaires may be connected to the generator to provide operational lighting in the event of a power outage.

**2.10.6 Electrical Sustainable Design Systems**

Along with following the California Energy Code we will incorporate daylight harvesting and occupancy and vacancy sensors throughout the facility.

In addition to the above measures the use of photovoltaic panels to produce power is another option to increase sustainability for the project.

**2.10.7 Electrical Communications**

*Electronic Communications System Overview:* Communications systems include a Structured Cable System, Public Address (PA) System, and a Telecommunications Grounding Connection.

This narrative describes the systems and basic operations of the communication system for the new Maintenance and Operation Building.

*Governing Codes:*

California Electrical Code (CEC) provides minimum safety requirements for these systems. Design and installation is based on the minimum CEC requirements, BICSI, and IT best practice and manufacturer's recommendations. Structured Cable System pathways will be based on current telecommunications performance standards.

*Public Address (PA) System:*

Amplifiers and speakers will be provided throughout parts of the facility and utilized through the telephone system or dedicated microphone. PA speakers will be strategically within the areas of the facility requiring a PA system to provide uniform sound coverage of those facility areas for all PA announcements.

*Structured Cable System:*

Intra-facility Structured Cable System pathways will be provided for owner provided equipment including, but not limited to: wireless access points (full building coverage if required), administrative workstations, shop workstations, fuel station.

## DESIGN CRITERIA NARRATIVE

*Telecommunications Rooms:*

The facility will have a Main Telecommunications Room (MTC) for the Main Distribution Frame (MDF), Servers, security equipment, routers and switches. The MTC will also act as the Main Point of Entry (MPOE) for offsite service. Telecommunications Closets (TC) will be provided as required to provide connectivity to the Intermediate Distribution Frame (IDF) for all work stations. All rooms shall be designed for future expansion and be equipped with equipment racks and cable management systems for organized and efficient cable routing.

*Grounding System:*

A telecommunications grounding will be implemented to protect telecommunications equipment. The telecommunications grounding system will connect to the Electrical Safety Grounding System.

**2.10.8 Electrical - Security***Electronic Security Systems Overview:*

Security Systems include a Video Surveillance System (VSS), and an Access Control System. Security system devices will be strategically placed throughout the facility based on client requests, best practice, and industry standards. This narrative describes the systems and basic operations of each electronic security system for the new Transit Operations and Maintenance Facility.

*Governing Codes:*

California Electrical Code (CEC) provides minimum safety rules for these systems. Design and installation is based on the minimum CEC

requirements, best practice and manufacturer's recommendations.

*Systems Monitoring:*

Security Systems will be monitored in operations or general manager office (TBD) with exact locations to be determined. Off-site monitoring, if required, can be included.

*Video Surveillance System (VSS):*

A VSS will be provided to real time and recorded video of critical areas and the vehicle parking areas. The VSS will utilize strategically located cameras for video monitoring and recording for forensic use. Real time monitoring and forensic play back will be available onsite (TBD). Viewing and playback can be viewed using password on computers or a dedicated VSS workstation. Video recording retention length to be determined.

*Access Control System:*

A card access system compatible with the existing systems to allow access to the site gates, building staff entry, and critical areas will be provided.

*Building Access Doors:*

Entrance into facility buildings through building doors will be controlled by a card reader system. When a valid RFID card is presented to the local card reader at the door, the lock will be opened, allowing ingress.

Entrance gates can also function on a schedule. For example, doors / gates may be left open during business hours for free ingress/egress, but after-hours ingress is controlled by the card reader system.

*Intercom System (if required):*

The facility will be equipped with an intercom system consisting of 2-way intercom stations located at desired locations in the yard and building.

The intercom system can be used in conjunction with the access control system as ingress or egress requests can be made from an intercom station.

*Uninterruptible Power Supply (UPS) System:*

A UPS system will be provided for security electronics to allow security electronics to maintain function in the event of a power interruption. Length of power back up to be determined.

**2.10.10 Generator****2.10.11 Radio & Computer Aided Dispatching (CAD)****2.10.12 IT/Radio Team****2.10.13 Fare Collection****2.10.14 Bus CCTV Backend****2.10.15 Fleet Watch**

## DESIGN CRITERIA NARRATIVE

**2.11 Functional Equipment**

This section will cover the functional equipment required to effectively operate in a bus operation and maintenance facility.

**2.11.1 Vehicle Lifts**

Vehicle lifts are implemented in facilities to allow a technician to inspect and maintain the underside of vehicles. The advantages of vehicle lifts include ease of use, safety, and improved productivity. The selection of the appropriate lift should be carefully considered and designed for the specific functions within the bay. There are several factors to be considered in the appropriate vehicle lift selection including (but not limited to) the following:

- Function and bay sizing requirements
- Facility budget
- Type of vehicle
- Number of vehicle axles
- Wheelbase range(s) between vehicle axles
- Vehicle access and orientation in bay

**2.11.2 Vehicle Lift Types**

The following are lift types to accommodate the SFMTA Fleet. Portable lifts are ideal for supplementing flat bays with functional lifts. They offer flexibility for facilities and are an economical addition to a newly constructed, renovated, or existing facility. Portable lifts can be paired in any grouping to meet the bay needs to lift a wide range of vehicles. Together the set of lifts, most common sets include four or six, will lift a vehicle in unison. Because the portable lift raises the vehicle from the wheel or tire, it inherently prevents the mechanic from accessing areas

behind the wheel such as the brake drums/rotors, the suspension, and the steering components of the vehicle.

*Battery Powered (Wireless) Portable Lifts*

The battery option brings a benefit from a planning and operating perspective, as well. Nearby electrical outlets to power the lifts are not required in each work area. The wireless column lifts are truly the most versatile of the mobile column lifts available. The wireless column lifts have no cords on the shop floor reducing clutter and promoting a safe and efficient facility environment. Wireless lifts address the issue of excess cables in a bay but this feature is a cost premium compared to wired lifts.

Some batteries can be charged with a standard outlet and do not require a specialty receptacle or voltage, which translates to savings on installation costs. Battery powered lifts can be stored in a dedicated, remote charging location to allow for a less cluttered bay and shop area.

Battery-powered options can be moved out to the shop floor as needed and then stored in a small charging zone when not in use.

*Axle Engaging Lifts:*

Axle-engaging lifts allows the mechanic to work on the vehicle while it is lifted and are ideal for heavy maintenance, tire repair, and body repair. The vehicles are lifted to a comfortable working height for technicians and allow for maintenance and inspection on all four sides and underside of the two- or three-axle vehicle. The wheelbase range can be tailored for the various vehicles

maintained at the facility. Axle-engaging lifts come in two different styles: post (piston) and scissor.

The post (piston)-style lift allows for maximum operational clearance and comes in either two- or three-post configuration. Generally, the posts take up less space compared to the scissor-style lifts and allow greater work coverage underneath the vehicle.

The scissor-style lift comes in either two- or three-scissor configuration. The scissor containment box is shallower compared to the post-style lift and typically costs less to purchase and install. The shallower containment box is ideal for facilities located on a site with high water table or unstable soils.

The axle-engaging scissor-style lifts take up more space than the post (piston)-style lifts, creating a more constrained work setting for a technician. The articulating scissors have more moving parts which may result in more maintenance compared to a post-style lift. These lifts can be sold with an aftermarket bellows or skirt cover to protect the articulating scissor components and openings.

*Platform, Pit-Emulating Lifts:*

Platform or pit-emulating lifts are ideal for preventative maintenance and inspection operations. These lifts can either be flush mounted or surface mounted. The surface mounted configuration requires vehicle ramps to allow the vehicle to access the platforms. Additional space should be considered to allow for these access ramps.

## DESIGN CRITERIA NARRATIVE

The lifts can either rise straight up (vertical rise) or displace (parallelogram) in one direction or another.

In a Chassis or Undercarriage Wash Bay, the vehicle is lifted and displaced with the engine compartment positioned over a large, grated pit. The engine compartment, which typically collects the most dirt and grit, is washed, and the horizontal displacement allows for the dirt and grit to fall into the pit below, instead of at the base of the lift.

### 2.11.3 Cranes and Hoists

Cranes and hoists allow a user to transport large components and equipment within various areas of a facility. It is important to define what functional areas of a facility need to have crane coverage in an effort to define the crane's travel direction and select the correct crane type. There are several factors to be considered in the appropriate crane and hoist system selection including (but not limited to):

- Desired area coverage
- Interior clearance
- Building structural systems
- Coordination with other facility systems (such as mechanical, electrical, lighting, fire protection, overhead doors, etc.)

### 2.11.4 Crane Types

The following are crane types recommended for SFMTA.

*Overhead Bridge Cranes:*  
Overhead bridge cranes allow for maximum

coverage within a desired area. Bridge cranes include a single or double girder supported by end trucks which travel the length of the area on running rails and beams. The girder(s) carry a hoist used to raise and lower the large components or equipment. Bridge cranes are available as top-running or underhung configurations.

#### *Top-Running Bridge Cranes:*

Top-running cranes are typically used to lift heavier loads (above 20 tons). Top-running cranes require a bracket attached to the building structural system or an independent structural system entirely to support the crane's running rails for lateral movement. This crane support system limits the top-running crane coverage area.

A top-running double girder bridge crane creates a smaller profile compared to a single girder bridge cranes. Double girder cranes should be used in applications where minimal clearance is allowed for the bridge crane travel.

Top-running cranes are also beneficial if additional headroom is required. Because the single or double girder is positioned on top of the end trucks, it allows for additional clearance below the girder.

#### *Jib Cranes:*

Jib Cranes may swing through an arc to give lateral movement to any items. They are ideal for lifting items and transferring short distances of 20 feet or less. Jib cranes generally have a lower capacity limit than bridge cranes. Jib Cranes can be freestanding, foundation mounted, column

mounted, or compression mounted/cantilevered. Jib cranes cover more of the floor space than a monorail hoist but less than an overhead bridge crane.

#### *Monorail Hoists:*

Monorail hoists are ideal for facilities or processes which require lifting and transporting materials along a fixed path, especially from one level to another. Despite operating on a fixed path, monorail hoists can provide flexibility by operating on curves, slopes, or multiple support tracks. Typically, the weight capacities for hoists are less than capacities of bridge and jib cranes.

### 2.11.5 Vacuum Systems

Part of servicing a vehicle fleet means regular interior vacuuming to keep vehicles clean for vehicle operators and passengers and to extend the useful life of the interior surfaces.

### 2.11.6 Factors in Equipment Selection

Typically, the larger the fleet is the more variables that enter into the decision of selecting the best-suited vacuum system for an agency. There are several factors to be considered in the appropriate vacuum system selection including (but not limited to):

- Length of service cycle
- Type, size, and number of vehicle to be vacuumed
- Positioning of the vacuum

## DESIGN CRITERIA NARRATIVE

### 2.11.7 Vacuum Equipment Types

Since SFMTA will be cleaning the interior of the buses in the parking positions backpack-type and canister-type vacuums will be beneficial.

#### *Backpack-type Vacuum:*

Backpack-type vacuums allow cleaning staff to enter the vehicle and get a more intimate clean. Backpack systems work well for agencies who are looking to minimize initial costs of the facility and additional units/backpacks can be purchased as needed for future growth/replacement. Most backpack units require electrical connection and the cord can be difficult to manage when traveling into the vehicles.

#### *Canister-type Vacuum:*

The canister-type vacuum is a small, contained unit located on the service island with a typical maximum hose length of 25 feet and is similar to those found at gas stations.

For the shorter hose models, dust and dirt from the vehicle floor is swept toward the vehicle doors, then the canister vacuum is used to extract the dust and dirt. While relatively inexpensive and requiring only a small amount of space on a service island or housekeeping pad, the small size require the canister to be emptied frequently to a nearby trash receptacle. Also, the short hose length does not allow for full-length vehicle vacuuming for longer vehicles. Although the extraction power is not as effective, some vacuum models include hose lengths up to 50 feet. The canister-type system can be appropriate for smaller fleets with limited service island space and

service budgets. Another advantage is the ability to quickly service and replace an entire canister if necessary.

### 2.11.8 Vehicle Exhaust Systems

Vehicle exhaust systems are required to remove harmful vehicle exhaust (such as diesel, gasoline, or CNG). Even though vehicles are run only a short time indoors and with open doors, the vehicle exhaust can build up within the building. Without appropriate control and removal of the exhaust, fumes can lead to worker illness, increased facility maintenance, and damage to sensitive components and electronics. The most effective method of capturing and removal of vehicle exhaust fumes is to capture them at the source. Capturing these gases at the source provides a safer and more pleasant working environment.

### 2.11.9 Factors in Equipment Selection

There are several factors to be considered in the appropriate vehicle exhaust system selection including (but not limited to):

- Type of vehicle
- Size of vehicle exhaust
- Type of vehicle fuel
- Exhaust location on vehicle(s)
- Facility budget
- Functional bays requiring vehicle exhaust
- Orientation of vehicles in bay

### 2.11.10 Equipment Types

Vehicle exhaust systems will be required at the Paratransit Facility.

#### *Hose Reel Exhaust System:*

These systems are ideal for facilities with high ceiling or roof structure. The compact design is ideal in instances where other equipment, such as overhead cranes, need to be considered or where taller vehicles must pass. The hose reel can either be spring or motor-operated to activate the exhaust fan. Exhaust systems can either be individually exhausted to the exterior or tied into one central system. Vehicle exhaust reels that are individually exhausted promotes energy efficiency because the only air drawn from the duct is from the vehicle with the running engine. A more powerful fan must be used with exhaust reel systems that have connected ductwork due to the extended distance required to exhaust the products of combustion along with the potential of drawing air from the exhaust reels that are not in use. Central systems tend to use more energy as they require larger fans/motors, however, they require fewer penetrations to the exterior of the building. If this system is desired, it is important to consider adding a monitoring system that can help limit energy use by matching the speed and draw of the central fan with the number of reels being used.

### 2.10.11 Vehicle Wash Systems

Wash Systems play an important role in maintaining the entire fleet. Vehicles that are cleaned properly last longer, and create a more enjoyable experience for both the staff maintaining the vehicles and the public.

## DESIGN CRITERIA NARRATIVE

**2.10.12 Factors in Equipment Selection**

Understanding the capabilities of each type of system will ensure that the range of vehicle types are washed thoroughly while being conscience of environmental goals for the project.

There are several factors to be considered in the appropriate vehicle wash system selection including (but not limited to):

- Frequency of Wash
- Desired Wash Time
- Desired or Expected Cleanliness
- Number of Vehicles Washed
- Size of Wash Bay
- Facility Budget
- Type of Vehicle
- Profile of Vehicle
- Water Treatment
- Water Reclamation
- Stormwater Capture & Other Sustainable Practices
- Air Dryers/Wipers
- Climate & Environment/Elements
- Bike Racks on Buses
- Vehicle-mounted Equipment

**2.10.14 Types of Wash Systems**

A Chassis Wash System is recommended for SFMTA Paratransit.

*Chassis Wash:*

Chassis Wash Bays are a great addition to any Wash System. In order to properly clean the underside and chassis of the vehicle, the vehicle can be elevated with a Vertical Rise or Parallelogram Lift in a designated Chassis Wash Bay. This function will also require a High

Pressure Hot Water Heater/Sprayer. This unit as well as the console for the lift may be placed in a designated area away from the majority of the spraying/cleaning operation.

**2.10.18 Compressed Air and Lubrication Distribution Equipment**

The compressed air and lubrication distribution systems are two important aspects of a facility that provide ease of use for the mechanics working in a multi-bay facility. The compressed air and lubrication piping will need to be sized properly to support the shop equipment throughout the facility. The lubrication equipment needs to support the vehicles being serviced in order for the facility to be most efficient.

**2.10.19 Factors in Equipment Selection**

There are several factors to be considered in the appropriate compressed air and lubrication system selection including (but not limited to):

- Number of Bays
- Lubrication Fluids needed at each location
- Length of longest piping run
- Monitoring Technology

**2.10.20 Equipment Types***Rotary Screw Compressors:*

These types of compressors use two rotors or helical screws to compress air to produce compressed air. Rotary screw compressors are quieter than piston units, allowing a quieter work environment while operating relatively energy-efficiently. Operating temperatures are at least 100°F cooler than piston units, resulting in longer life.

Because the moving parts of a screw-type compressor do not produce as much friction as the piston-type compressor, screw-type compressors are about 30% more efficient in producing compressed air with the amount of power that it consumes while in operation.

Rotary screw compressors are most efficient when in constant operation because they require 6 minutes to ramp down from compression duty. During this time, the compressor is not fully loaded but still requires some amount of power input that does not produce any compressed air. However, the amount of time required to ramp down from compression duty will be reduced to about 20 seconds when the unit is operated by a variable frequency drive (VFD).

The maintenance (long-term) cost of a rotary screw compressor is one major drawback because the more complex equipment with electronic components requires more regular maintenance compared to piston-type compressors. However, because screw-type compressors do not operate with as much friction as piston-type compressors, the frequency of maintenance duty is significantly less than piston-type compressors.

*Reciprocating Piston Compressors:*

Piston compressors are typically used for general-purpose applications such as workshop-air, where the air is used for hand-tools, cleaning dust, small paint jobs, etc. It is one of the most commonly used compressor types. Piston compressor are available from 1 HP to about 50 HP. The motors can be duplicated (duplex) in effort to double the power output (horsepower) and can then be

## DESIGN CRITERIA NARRATIVE

configured in a lead-lag operation to ensure equal wear on the motors and to increase the energy efficiency of the compressed air production.

Piston compressors are more economical compared to rotary screw compressors because they require less maintenance and work well in maintenance shops as they are more suitable for high pressure applications.

Piston-type compressors have a simple design and can be more easily fixed by facility maintenance staff compared to a screw-type compressor.

There are a few drawbacks to piston compressors such as excessive noise, high outlet temperature, and high oil content in air piping. These can all be mitigated through engineering a system appropriately.

#### *Refrigerated Air Dryers:*

An air dryer is an integral piece in compressed air treatment system. Air quality can have a significant impact on compressed air tools and equipment. Properly treated compressed air, and the right air dryer, will improve productivity, system efficiency, and product or process quality. Refrigerated air dryers are specifically designed to handle the high discharge temperatures of piston compressors. The purpose of using a refrigerated air dryer is to remove entrained moisture in the air to prevent corrosion in air tools with moving steel parts. Refrigerated dryers typically provide dew points of 40 °F at rated conditions.

A few filters are required to be used in compressed air systems. The filter downstream

of the compressor and upstream of the dryer is the particulate air filter. This type of filter removes any dust or particulates in the air. The second filter located downstream from the dryer is the coalescing air filter. This type of filter removes the excess oil and water left in the air by the compressor and the dryer.

#### *Desiccant Air Dryers:*

These types of air dryers do not require any power to dry the air, as is the case with refrigerated air dryers. These types of dryers utilize a filter that captures the entrained moisture in the compressed air. Desiccant dryers trap so much of the moisture from the air that they typically reduce the dew point temperature to -40°F.

#### *Compressed Air Receivers/Tanks:*

Air receivers are pressure vessels that store treated or untreated compressed air. The air stored in these vessels alleviates the frequency of starts required by the compressor whenever compressed air is used. Some reciprocating and rotary screw compressors can be mounted on an air receiver but some are base/floor-mounted.

#### *Bulk Fluid Storage Tanks:*

Bulk Storage Tanks allow facilities to store large quantities of fluids while meeting required codes with double wall containment. Tanks can be monitored to promote more efficient product inventory control and throughput data. Tanks are available in sizes from 100 gallons to 50,000 gallons based on the frequency that the facility wishes to receive fluid deliveries. These tanks can also be utilized for waste/used fluids such as Used Oil and Used Coolant. Tanks are typically stored

in a central location along an exterior wall for reduced piping lengths and ease of delivery and extraction of bulk fluids.

The amount of waste from empty bottles and jugs, the amount of time it takes to handle each bottle, and the amount of spilled fluid is greatly reduced when using bulk fluid storage tanks. Bulk fluid storage tanks typically hold amounts of liquid greater than 100 gallons for the use of all mechanics within the building. A tank level monitor is an integral component of the storage tank and will signal the low-level condition at which point the lubrication distributor would refill the storage tanks. Storage tanks are also equipped with a leak sensor which signals an alarm to sound in the event of a leak.

Bulk fluid storage tanks are typically double-walled to conform to the code requirement for spill containment. Another method of containing leaks is to provide a recessed concrete pit in the bulk fluid storage room directly underneath the bulk fluid tanks. Whichever method is chosen, 110% of the storage capacity of the tank needs to be contained in the event of a leak, as required by code.

#### *Delivery Pumps:*

Fluids need to be pumped from the bulk fluid storage tanks to the point of application in the maintenance bays area.

#### *Piston Pumps:*

Pneumatically-powered piston pumps are powerful enough to transfer the fluid from the storage tank to the point of application, hundreds of feet away. Piston pumps can be mounted

## DESIGN CRITERIA NARRATIVE

directly on top of the tank in order to dampen vibrations. Piston pumps are loud pieces of equipment [73 - 80 dB(A)]. This is one reason to enclose the lubrication storage area with heavy walls to dampen the noise.

*Diaphragm Pumps:*

Diaphragm pumps can also be used to pump fluid from the bulk fluid storage room to the maintenance bays. These pumps do not offer any mechanical advantage - the pressure of the compressed air supply is equal to the pressure of the fluid at the discharge end of the pump at a low flow condition. Diaphragm pumps are typically used for diesel exhaust fluid and engine coolant but are also capable of transferring engine oil, hydraulic oil, automatic transmission fluid, windshield washer fluid, diesel fuel, and gasoline. Special precaution needs to be taken in pumping diesel exhaust fluid to protect the pump and components against corrosion from this type of fluid. Diesel exhaust fluid pumps have either only plastic parts that contact the pumped fluid or it contains stainless steel components.

Another special case involves the pumping of engine coolant when the coolant is provided as a concentrate. A 30 gallon drum of water with a float valve is typically specified when mixing the concentrated engine coolant with the water. The diaphragm pump handles the mixing duty to supply a mixture of coolant to water at the desired ratio.

*Piping:*

The size of each pipe varies according to the distance that the fluid travels from the storage tank to the point of application. In order to

determine the size of the pipe required to ensure that fluid will transfer from the lubrication storage room to the point of application, the lubrication system designer will need to know how many dispensers stemming from the same pipeline header are requested to be in use at any given time. Generally, the pipe size increases as the demand of fluid flow increases. Pipes with a smaller inside diameter restrict the fluid from flowing more than pipes with a larger inside diameter. Wall thicknesses also need to be considered when selecting the pipe in order to provide the rigidity necessary to keep the pipe from bursting. The fluid pressure within the pipe is typically 1000 psi and even more for chassis grease.

The cross section of a header can be designed to decrease over the length of the run from the storage tank to the maintenance bays. This will help to decrease the cost of materials and will also ensure an acceptable fluid pressure at the point of application. The lubrication system designer calculates the size of pipe based on fluid mechanics equations. The pumps are also sized in this way to ensure that the pipe length and the pumps are paired to dispense fluid at the furthest point of application.

The type of the pipe selection varies according to the type of fluid being transferred. Bulk fluid liquids may flow through carbon steel. Compressed air will be routed through copper to prevent corrosion. Compressed air does not require pipe of a high tensile strength because it operates at a comparatively low pressure than other fluids.

*Lubrication/Commodity Hose Reels and Nozzles:*

Lubrication Hose Reels are stationary units in the bays and piped from Bulk Storage Tanks. These reels are located in areas where maintenance and re-filling of fluids occurs, typically overhead on columns or mounted to nearby walls. Technicians have the ability to quickly dispense and measure fluids being dispensed into vehicles.

Hoses comprise the final length of fluid transfer material before exiting through the point of application, the nozzle. Hose reels offer the convenience of retracting the hose with no significant effort by the user to move the hoses out of the work space. This eliminates tripping hazards and it decreases the amount of time it takes to move the hose from the work area. Multiple hose reels can be grouped in parallel and mounted onto the same bracket. In this case, the reels become a reel bank. Hose reels are typically installed overhead on columns, mounted to nearby walls, or are suspended from the ceiling structure. The fluids that the mechanics will be able to dispense include automatic transmission fluid, engine coolant, two types of oil, chassis grease, gear oil, windshield washer fluid, diesel exhaust fluid, compressed air, and water.

*Fluid Management System:*

The volume of several types of fluids that the mechanics dispense can be tracked by use of the fluid management system. The amount of each type of liquid can be monitored by the Fleet Manager to determine the appropriate time to order more bulk fluid from the distributor. The fluid management system tracks the amount of each dispensed liquid by each individual nozzle.

## DESIGN CRITERIA NARRATIVE

With the fluid management system, the user can enter the amount of fluid that they would like to dispense from the nozzle. The pump air controls will allow the transmission of compressed air to the pumps by the storage tank to allow pumping to commence.

### *Waste Recovery System:*

When mechanics drain fluids such as oil and coolant from the vehicles they maintain, they use a mobile receptacle to collect the used fluid. When the mechanics need to empty the used fluid containers, they can roll the units to nearby diaphragm pumps located in the maintenance area and pump the used fluid into their respective storage tanks in the lubrication storage room. Tank level monitors are typically installed in the tanks to signal an alarm to sound when the tank gets above a certain level. When the tank is full, a used fluid evacuation company can be contacted to remove the used fluid from the storage tanks.

### 2.10.21 Support Shop Equipment

Support equipment is included in many areas of the facility to supplement the functions associated with vehicle maintenance. Items such as workbenches, vises, buffer/grinders, drill presses, hydraulic presses, saws, blast cabinets, parts washers, jacks and stands, etc. are all part of an industry standard recommended equipment package.

### 2.10.22 Storage Equipment

Storage systems play a significant role in the layout and operation of a facility. Storage equipment can help with the organization of a

facility, while promoting efficiency in operation and safety. Appropriately sized and located storage equipment also allows for flexibility of storage and shop spaces.

Parts and tool storage areas may consist of a variety of storage equipment items such as shelving units, drawer units, bulk storage and pallet racks, rack system with forklift/crane or motorized carousel and shuttle units.

### 2.10.23 Factors in Equipment Selection

There are several factors that need to be considered in the appropriate storage equipment selection including (but not limited to):

- Desired quantity of stored materials
- Security of stored materials
- Available square footage
- Available height in space

### 2.10.23 Equipment Types

#### *Small Storage Equipment:*

Small storage equipment is used to store a range of small to medium sized parts, materials, and tools. This storage equipment ranges from modular drawer units, shelves, lockable cabinets, and bulk storage racks. Best practices include a mix of these small storage equipment to increase flexibility for the facility.

#### *Bulk, Palletized, and High Density Storage Equipment:*

Bulk, palletized, and high density storage equipment uses the available vertical height and volume of a space to store the materials vertically as opposed to horizontal shelving like traditional shorter shelving racks. These systems reduce the

overall space utilization for parts storage allowing a reduction in the total building area.

This type of storage equipment includes: parts carousels, vertical lift modules, pallet rack, and adjustable racking system.

One issue to consider is the vertical storage of materials may require additional fire protection/suppression systems.

#### *Parts Carousel:*

Parts carousels are an automated parts retrieval and storage system which use the volume of a space to store large amounts of product in a small footprint. The automated system stores product in bins to maximize the storage capacity resulting in less wasted space compared to traditional shelving units.

The Parts carousel system uses bins of various sizes to store parts, materials, and tools. A digital control allows the operator to input a specific part number and the automated shuttle retrieves the tray with the requested part to an opening located at an ergonomic height. This system reduces the distance traveled by the operator to retrieve a parts, increases retrieval accuracy, and increases parts storage security. They also benefit the shelf life of the parts by controlling the environmental and atmospheric impacts on the stored product. The parts carousel length, width, and height is tailored for the specific facility needs. Unlike a vertical lift module, the parts carousels cannot be added on to in the future for additional storage capacity.

## DESIGN CRITERIA NARRATIVE

*Vertical Lift Module:*

Vertical lift modules (VLMs) are an automated parts retrieval and storage system which use the volume of a space to store large amounts of product in a small footprint. The automated system provides greater flexibility in handling different parts, sizes, weights, and accessibility. The VLMs store the trays to maximize the storage capacity and results in less wasted space compared to traditional shelving units. It is estimated VLMs on average save 70-80% of building square footage compared to traditional shelving racks.

The system uses large trays which hold bins of various sizes used to store parts, materials, and tools. A digital control allows the operator to input a specific part number and the automated shuttle retrieves the tray with the requested part to an opening where the operator is standing. This system reduces the distance traveled by the operator to retrieve a part, increases retrieval accuracy, and increases parts storage security. They also benefit the shelf life of the parts by controlling the environmental and atmospheric impacts on the stored product. Another benefit of VLMs is that they offer a means to track inventory effectively.

The VLM length, width, and height is tailored for the specific facility needs. Unlike the parts carousel, if additional storage is needed, VLM height can be increased or extended to allow for increased storage capacity.

The VLM is a costly system compared to traditional storage shelving and racking, but when

comparing it to the amount of equivalent space required to store the same amount of products on traditional shelving, the cost savings is nearly equal. This is due to the fact that the amount of constructed space decreases significantly.

The true savings are realized after the facility is operating as there will be less storage space to heat/cool over the life of the facility. Additionally, the parts staff does not need to spend a significant amount of time walking to retrieve and deliver parts and components.

*Pallet Rack:*

Pallet racks are the most cost effective high density storage solution. The racks are easy to install in a new, renovated, or existing facility and can easily be relocated. Pallet racks are appropriate for storage of larger materials and components.

Pallet racks require a forklift or pallet jack to access the palletized material stored on the racks. Although the pallet rack itself does not require a significant amount of floor space, the access required by a forklift takes up nearly three times the space of the pallet rack.

*Adjustable Racking System:*

Similar to a pallet rack, the adjustable racking system allows for the storage of larger materials, parts, and drums on removable pallets. Unlike traditional pallet rack the adjustable racking system allows for the pallets to be stored at varying heights based on the volume of palletized product. The adjustable racking systems range from 8- to 25-feet high, with the most common systems being around 13- to 15-feet high.

Pallets are stored in "bays" or sections which are sized according to desired pallet size or sizes. The horizontal bay configuration of these systems lends itself to ease of future expansion to the system if necessary.

Pallets are handled by a rack mounted, gantry-type overhead crane and mast. The crane and mast system allows for narrower aisles compared to traditional pallet racks, which typically requires roughly 50% more clearance for forklift access.

This system provides more consistent and organized product storage compared to traditional pallet racks requiring forklift-based solution.

**4.10.24 Tire Storage Equipment***Fabricated Tire Racks:*

Fabricated racks are an economical, durable and low maintenance tire storage option. They can be custom made to meet specific needs for storage capacity, space availability, and room configuration. They can be built vertically up to three tiers high for increased capacity. However, fabricated tire racks require additional equipment, such as a fork lift or pallet jack, for tire retrieval.

This presents the potential for injuries due to dropped tires during the retrieval process.

Depending on configuration, the racks can take up significant floor space, and racks need to be anchored in place to a wall.

## DESIGN CRITERIA NARRATIVE

*Stacking Tire Racks:*

Stacking tire racks allow for vertical storage of entire racks of tires rather than just individual tires, producing time savings when moving large quantities of tires at one time. The racks can be stacked two to three racks high, taking advantage of the vertical space in a shop, while freeing up valuable floor space. The stacks also make it easy and efficient to move an entire rack of tires for shipment or relocation within the shop, rather than moving tires individually.

A forklift or hoist is necessary for retrieval and relocation of racks. Tire retrieval from higher levels of the stacking racks can pose hazards if the racks are fully stacked, or if there is a lack of room to maneuver. Because of the stacked configuration, bottom tires can get a flat spot if stored for too long.

*Tire Storage Carousels*

Tire Storage Carousel systems are one of the more advanced ways to store and organize unmounted tires only. They can be operated with minimal effort by one person for easy tire retrieval. The technician simply rotates the carrier frames, locates the desired set of tires, stops at the proper position, and then, removes the tires safely and efficiently at ground level, all at the touch of a button. In addition to increased efficiency, the system reduces the risk of injuries by letting the machine do the lifting.

Tire Storage Carousels are an automated tire storage system which use the volume of a space to store large quantities of tires in a small footprint. The systems store tires on a series of horizontal beams to maximize the storage

capacity, resulting in less wasted space compared to traditional tire storage racks.

Unlike multi-tier tire racks, tire storage carousels bring the tire to the operator without the aid of a hoist or crane. This results in fewer accidents associated with lifting heavy tires. Tire storage carousels are, however, limited to unmounted rubber tires only. Mounted wheels and tires must be stored on conventional tire storage (floor mounted or multi-level shelving).

The tire storage carousel length, width, and height is tailored for the specific facility needs, including the size of tires to be stored. They are also available in lockable, weatherproof models for placement outside. The tire carousel enables the agency to keep an accurate count of inventory, since all tires are visible and are in one place.

There are a few downsides to tire carousels. As an automated piece of equipment, they require periodic maintenance. This means that tires are not accessible during repairs. The system also becomes inaccessible if an when the power is out. As with any equipment with moving parts, safety protocol is necessary to prevent injuries while the machine is in motion.

**2.10.25 Fall Protection**

Fall protection systems are necessary any time routine maintenance is being performed on the roof of the vehicle and operation of a facility. It is important to note that when fall protection systems are properly integrated into the overall design of the facility it is more likely they will be used on a regular basis.

**2.10.26 Factors in Equipment Selection**

There are several factors that go into the appropriate storage equipment selection including (but not limited to):

- Other Overhead Systems and/or Equipment
- Facility Budget

**2.10.27 Equipment Types***Portable Fall Protection Systems:*

A variety of portable systems are available that allow flexibility among the various bays and are typically less expensive and less impactful on the structure of the facility.

Possibly one of the greatest benefits to the portable fall protection systems is that they do not require any infrastructure such as special beams or bracing. They are a cost-effective solution to a facility renovation or upgrade. Additionally, they can be used anywhere in a facility, even areas with overhead crane equipment.

While these systems may seem like a viable option, one of the drawbacks to these systems is the effort required to move these into position to access the vehicle roof.

*Overhead Fall Arrest Systems:*

Overhead Fall Arrest systems are engineered systems designed into the structural building system. These systems typically operate along a mono-directional path to allow personally to travel the length of the vehicle roof.

The two main options for structurally integrated fall arrest systems are I-beam or track systems. Each option offers a variety of designs that can be

## DESIGN CRITERIA NARRATIVE

tailored to the specific vehicle and condition fall arrest condition.

*I-Beam Fall Arrest System:*

The I-Beam Fall Arrest System is integral to the structure of the building attached to the I-Beam above.

*Track Fall Arrest System:*

Track Fall Arrest System is a separate track that is provided by a manufacturer

*Pit Protection Systems:*

Lower Level Work Areas/Pits require a system to eliminate a potential fall into an open pit. The two main systems are removable steel pit covers and movable nets suspended from cables. Each design allows the technician working in the pit to access the area which they are performing maintenance or inspection work while protecting the opening above.

*Steel Pit Covers:*

The steel pit covers are customized to fit the width and length of the pit opening. The pit covers are positioned on an embedded angle in the pit opening and are typically flush with the finish floor to lessen the chances of personnel tripping while near the opening. The small openings prevent most tools and parts falling through the pit.

The pit covers are removable and allow the mechanic to remove one or multiple adjacent sections to access the underside of a vehicle. The pit covers simply stack on the adjacent cover and when the work is complete, the mechanic slides the section back into place.

Typical lengths of pit covers range from three- to four-feet and must weigh less than 50 pounds per OSHA requirements. Another advantage of the steel pit covers is that they are easy to clean off any oils and grease.

*Pit Safety Netting:*

The pit safety netting is a convenient solution to cover a pit opening. The netting allows a mechanic to enter a pit and easily drag the net the desired length of the opening to inspect the underside of a vehicle. Unlike the pit covers, if work is performed under the center of the vehicle or opening, the mechanic is required to drag the net to the required work position. Whereas the pit covers can be removed a section at a time. Once work on the vehicle is complete, the mechanic must drag the netting to effectively 'close' the opening. If this is forgotten or not performed, the mechanic may drive the vehicle out of the bay and expose the pit opening resulting in a safety hazard.

One advantage of the pit netting is a low installation costs. However, there are significant drawbacks of nets including they will sag over time and should be replaced as recommended by the manufacturer, effectively offsetting the lower initial installation costs. Unlike the pit covers, the netting openings do not prevent small tools and parts from falling through the pit opening. These openings can also be a hazard for personnel who may trip and fall into the pit netting.

## INTRODUCTION

This document presents the Design Criteria for the proposed Hatch San Francisco SFMTA facilities, by providing both micro and macro level design requirements. The Design Criteria format found in this section consists of Functional Area Modules. The Functional Area Module represents a detailed description of specific design issues for each of the areas listed in the Space Needs Program. Reference Space Needs Program for specific Scenarios. All Modules and related equipment are for representation purposes only and do not necessarily depict strict design conformance.

### 3.0 Sustainable Design

There are several sustainable design opportunities which can be approached at the new San Francisco SFTMTA facilities. Regardless of whether San Francisco Metropolitan Transportation Authority chooses to achieve LEED rating or not, these are good design practices. The Sustainable Design section outlines potential sustainable design opportunities appropriate for this type of facility. These options are broken into site features, Building Design and Materials, Mechanical Systems, Electrical Systems, and Plumbing Systems.

### 3.1 Utilities Design

The utilities for the maintenance facility are numerous and require close attention to detail. The coordination of the HVAC, electrical, and plumbing systems are critical to the proper function of the Shop and the heart of the facility. Providing an organized installation and design of these systems will make them easier to maintain in the future.

### 3.2 Abbreviations

A	=	Amperes	ICC	=	International Code Council
ADA	=	American Disabilities Act	IDF	=	intermediate distribution frame
AFF	=	Above Finished Floor	IES	=	Illuminating Engineering Society
AHJ	=	Authority Having Jurisdiction	K	=	1,000 Pounds
ASHRAE	=	American Society of Heating and Refrigeration Association of Engineers	lb	=	Pound
			LED	=	Light Emitting Diode
ATF	=	Automatic Transmission Fluid	LEED	=	Leadership in Energy and Environmental Design
BICSI	=	Building Industry Consulting Service International	LEL	=	Lower Limit Explosive Limit
BRBF	=	Buckling Restrained Brace Frame	LLWA	=	Lower Level Work Area
CA	=	Compressed Air	Max	=	Maximum
CBC	=	California Building Code	MDF	=	Main Distribution Frame
CE	=	Computer Equipment	Mech	=	Mechanical
CEC	=	California Energy Code	Min	=	Minimum
CFC	=	California Fire Code	MPOE	=	Main Point of Entry
CFM	=	Cubic Feet Per Minute	MTC	=	Main Telecommunication Center
CG	=	Chassis Grease	MUD	=	Mixed Use Development

HFHC	=	Hydrochlorofluorocarbons	VAC	=	Volts AC
HO	=	Hydraulic Oil	VCT	=	Vinyl Composite Tile
HVAC	=	Heating, Ventilation and Air Conditioning	VLM	=	Vehicle Lift Module
			VOC	=	Volatile Organic Compound
			VSS	=	Video Surveillance System
			W	=	Water
			WWF	=	Windshield Washer Fluid

## SUSTAINABLE DESIGN

### 3.3 Creating Sustainable Facilities

Sustainability is an essential and fundamental component of the facility. The key sustainability issues that should be explored in the planning and development of the facility include, but are not limited to, the following key points.

### 3.4 Balance Between Economic and Environmental Needs

To balance both economic and environmental needs that minimize environmental impacts, the facility design should maximize employee health, safety, and operation efficiencies. This priority objective should be considered at all stages of development of the facility.

### 3.5 Efficient Use of Resource Materials

Material resources are valuable and an efficient use should be encouraged in the development and operations of the facility. This can be implemented through the use of reusable, recyclable, and biodegradable materials as well as mandating the use of products that are extracted, harvested, and manufactured locally.

### 3.6 Efficient Use of Water Resources

The facility plan should encourage efficient use of water resources by sustaining habitats and ecosystems through resourceful planning. Examples could include the implementation of an effective storm water management plan and the use of environmentally compliant wash bays to service all vehicles.

### 3.7 Energy Efficiency/Renewable Energy Systems

Explore and promote opportunities to increase energy savings at the facility through the use of high-performance systems combined with utilizing renewable energy sources like solar, wind, and daylight harvesting.

### 3.8 Construction Methods

Methods of construction of the facility play a significant role in sustaining the environment. Utilizing strategies that minimize transportation costs by utilizing local resources and recycling procedures during construction to divert material from landfills will conserve energy and minimize pollution.

### 3.9 Sustainable Criteria

The following is a list of potential strategies to achieve sustainable building design.

- Operable windows/natural ventilation
- Lighting controls: Occupancy sensors, vacancy sensors
- Lighting designed to meet targeted LEED points
- Utilize daylighting strategies and daylight harvesting
- Provide user-adjustable comfort and lighting controls
- Underfloor ventilation
- In-floor radiant heating and cooling
- Water reclamation system
- Use of reclaimed water for vehicle washing

### 3.10 LEED Certifications

LEED, or Leadership in Energy & Environmental Design, is a green building certification program that recognizes best-in-class building strategies and practices. To receive LEED certification, building projects satisfy prerequisites and earn points to achieve different levels of certification. Prerequisites and credits differ for each rating system, and teams choose the best fit for their project.

Each rating system groups requirements that address the unique needs of building and project types on their path towards LEED certification. Once a project team chooses a rating system, they'll use the appropriate credits to guide design and operational decisions.

SFMTA guidelines are to meet LEED Gold Certification.

- |             |                 |
|-------------|-----------------|
| ▪ Platinum  | 80+ points      |
| ▪ Gold      | 60 to 79 points |
| ▪ Silver    | 50 to 59 points |
| ▪ Certified | 40 to 49 points |

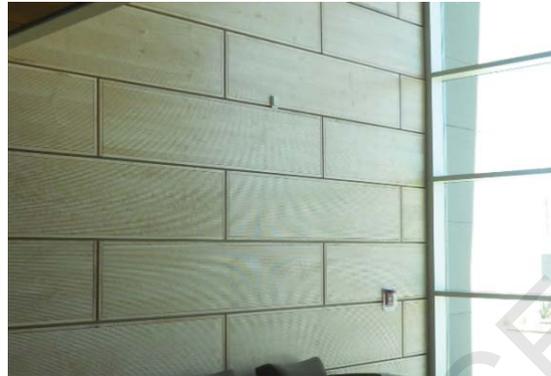

## SUSTAINABLE DESIGN

## 3.11 Building Design and Materials

Design and materials that facilitate sustainability include, but are not limited to:

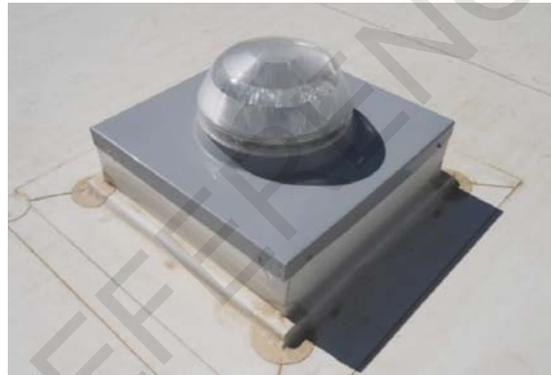

- Use durable long lasting building materials
- Natural light
  - ✓ Skylights
  - ✓ Clerestory
  - ✓ Roof monitors
  - ✓ Windows in bay doors
- Operable windows for natural ventilation
- Low Volatile Organic Compound (VOC) finish materials
- Use of local building products
- Use of recycled content of materials
- High R-Value roof and wall insulation
- Insulated value bay doors
- Low U-value windows and skylights
- Cleanable and maintainable light colored reflective floors, walls, and ceilings

Translucent clerestory windows natural light

Insulated translucent sectional door

Solar tube day lighting strategy

Light reflective floor

## SUSTAINABLE DESIGN

## 3.12 Mechanical Systems

Mechanical systems that facilitate sustainability include, but are not limited to:

- Additional cost alternative: Radiant floor slab heating
- Variable air volume air handling units
- Variable frequency drive motors
- High efficiency motors for air handling units and DX compressors
- Economizers for free cooling with 100% outside air at air handling units
- Demand control ventilation with CO2 and occupancy sensors for reducing ventilation requirements during unoccupied periods

Destratification fan

Heat recovery piping

## 3.13 Additional Cost Alternatives

- Radiant floor slab heating
- Thermal solar heating for domestic water heater
- High efficiency boiler for hydronic heating loop
- Ground source heat pumps
- Destratification fans

Underfloor air distribution vent

Radiant floor system

**SUSTAINABLE DESIGN**

**3.14 Electrical Systems**

Electrical systems that facilitate sustainability include, but are not limited to:

- Provision for photovoltaic panels to be installed on the roof
- Provision for future photovoltaic panels to be installed on shade structures located in the parking lot
- Maximize lighting controls with daylight harvesting and occupancy and vacancy sensors
- LED lighting systems
- Task lighting in Repair Bays
- Efficient process equipment

LED lighting

Photovoltaic panels on roof

**3.15 Plumbing Systems**

Plumbing systems that facilitate sustainability include, but are not limited to:

- Rainwater harvesting for irrigation
- Vehicle wash water reclaim
- Low flow plumbing fixtures
- Sensor operated faucets
- Grey water (purple pipe) for water closets
- Tankless water heaters

Dual flush toilet

Low-flow plumbing fixtures

Wash water reclaim system

Rainwater harvesting

## UTILITIES DESIGN

**4.0 Architectural/Structural**

- Coordinate routing, support systems, and clearances for mechanical ductwork, plumbing piping and electrical conduit
- Routing shall run above forklift and walk aisles
- Group wherever possible

**4.1 Mechanical Systems**

- Route main ventilation ductwork above walk/forklift aisles
- Use mezzanines for mechanical units

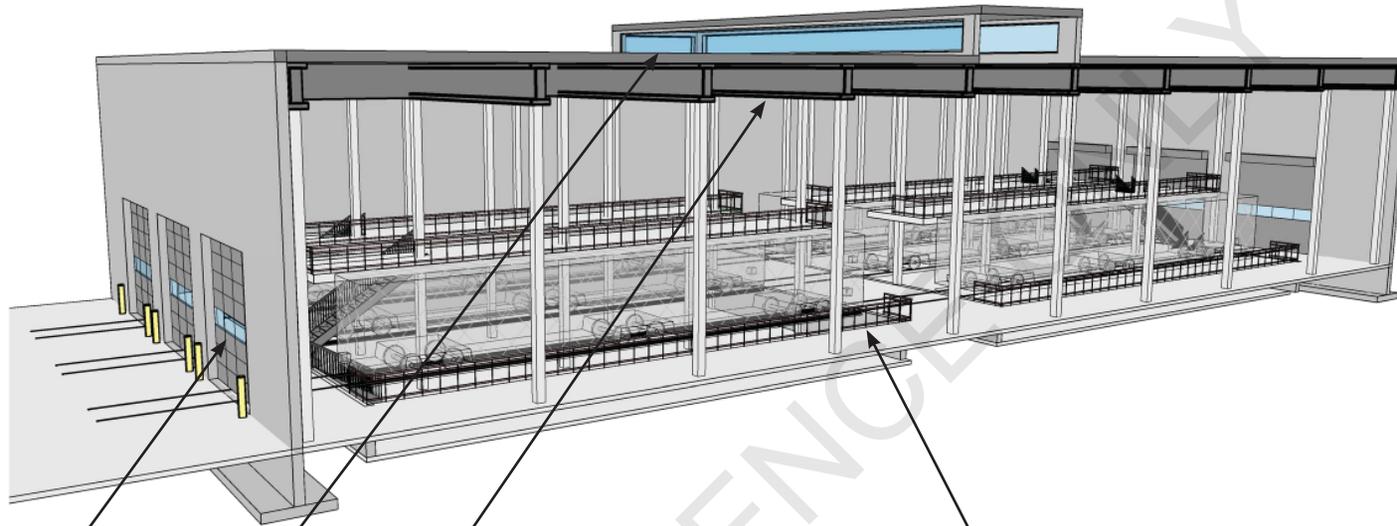

**4.2 Plumbing Systems**

- Route water, gas, service equipment piping above ground and above walk/forklift aisles

**4.3 Electrical Systems**

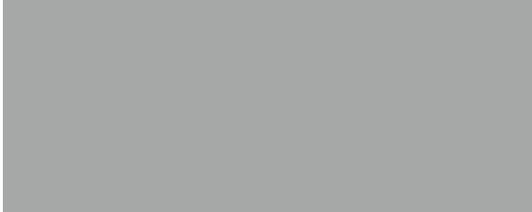

- Route main conduit runs above ground and above walk/forklift aisles.
- Communication systems
- Route branch circuits, equipment feeds above ground to facilitate future renovations

UTILITIES DESIGN

- Geothermal
- Daylighting through skylights/clearstories/roof/monitors/windows in bay doors
- Low VOC finishes
- Operable windows/natural ventilation
- Use of recycled content of materials
- Destratification fans in high bay areas

- Radiant floor slab heating
- Air quality sensors for exhaust fan controls
- Use of durable, long-lasting buildign materials
- Occupancy sensors
- View windows in overhead doors
- Use of local building products

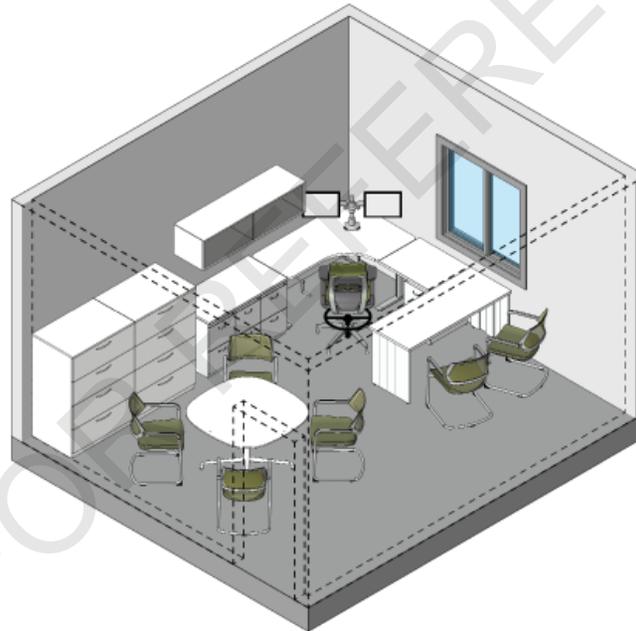

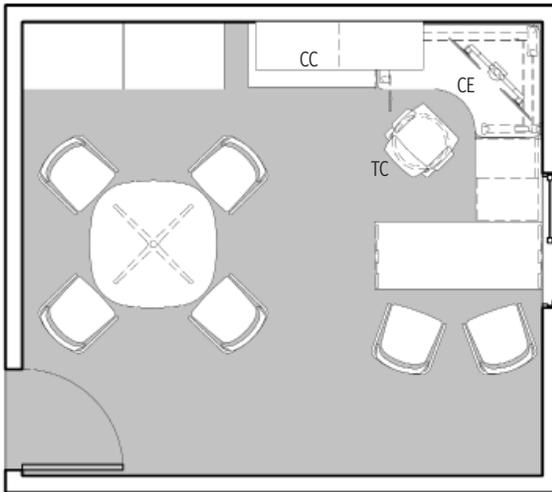

OFFICE MODULES

FOR REFERENCE ONLY

## PRIVATE OFFICE - 224 SF

## FUNCTION

Private office for completing work tasks and holding small meetings.

## RELATIONSHIP TO OTHER AREAS

- Case specific; reference general module: office areas specific to each group

## RECOMMENDED CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

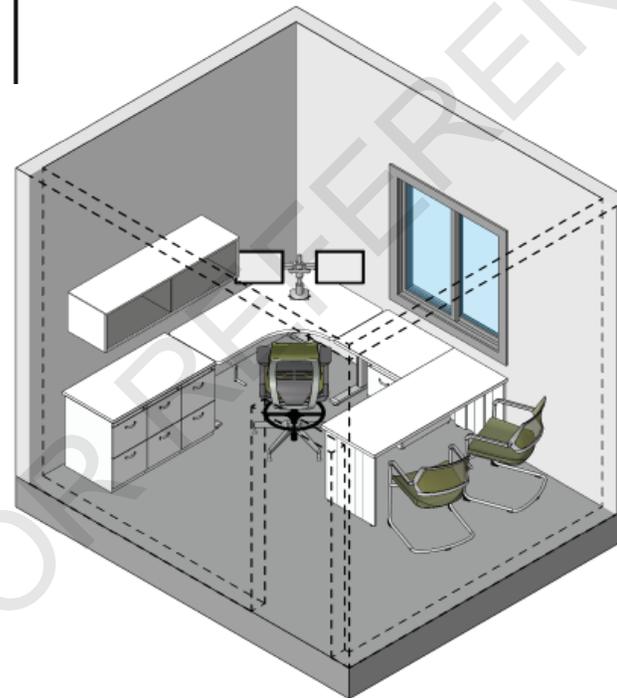

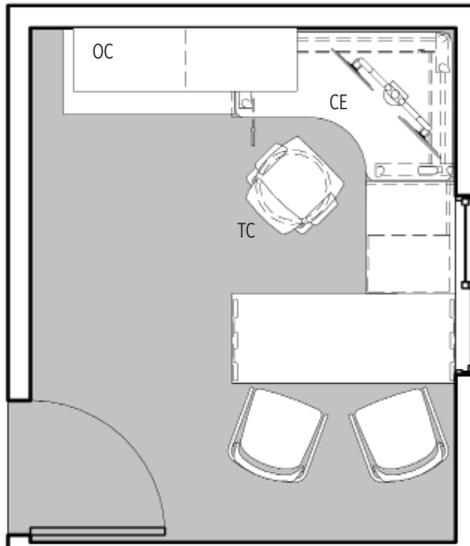

## TYPICAL EQUIPMENT/FURNISHINGS

- Task chair
- Sit/stand workstation
- Under surface vertical files
- Cabinets
- Table & Chairs

## TYPICAL DESIGN FEATURES

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Carpet tile floor with rubber base for Administration or Operations areas (recommended)
  - ✓ Resilient floor covering with base for maintenance areas (recommended).
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" door with loadable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degree Fahrenheit
  - ✓ Cooling set point: 74 degree Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (35 foot candles average)
  - ✓ Provide (four minimum) general purpose duplex receptacles and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and conduit rough-ins to three other locations in room
- Lighting Control:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

## PRIVATE OFFICE - 120 SF

**FUNCTION**

Private office for completing work tasks and holding one on one meetings.

**RELATIONSHIP TO OTHER AREAS**

- Case specific; reference general module: office areas specific to each group

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

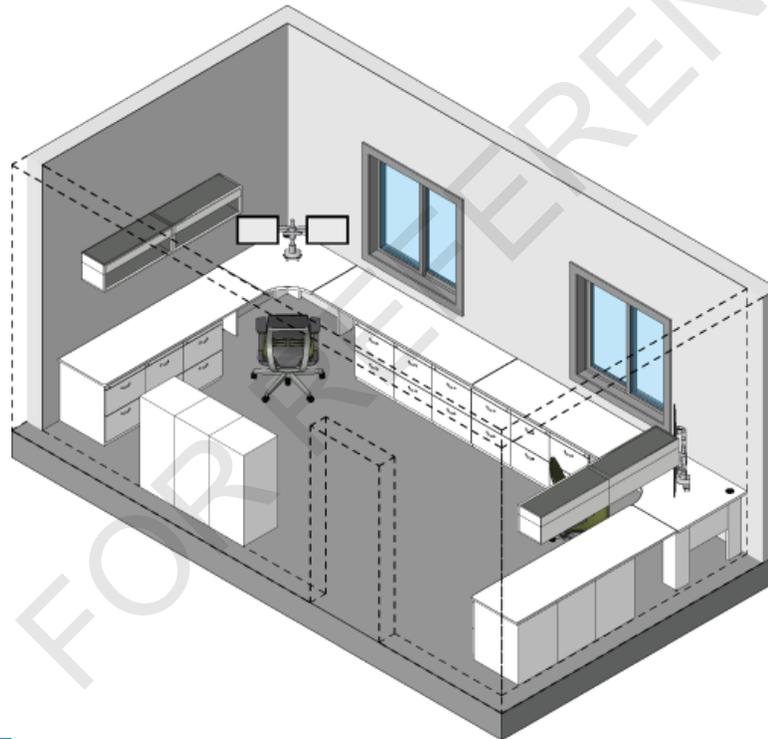

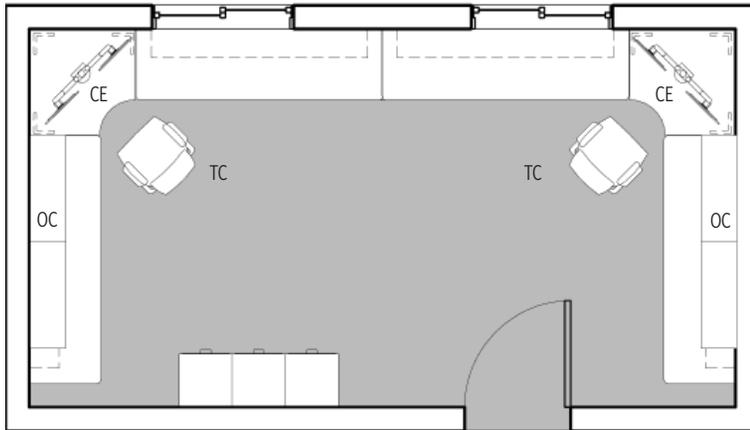

**TYPICAL EQUIPMENT/FURNISHINGS**

- Task chair
- Sit/stand workstation
- Under surface vertical files
- Cabinets
- Guest chairs

**TYPICAL DESIGN FEATURES**

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Carpet tile floor with rubber base for Administration or Operations areas (recommended)
  - ✓ Resilient floor covering with base for maintenance areas (recommended).
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" door with loadable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degree Fahrenheit
  - ✓ Cooling set point: 74 degree Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (35 foot candles average)
  - ✓ Provide (four minimum) general purpose duplex receptacles and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and conduit rough-ins to three other locations in room
- Lighting Control:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

## SHARED OFFICE - 120 SF

## FUNCTION

Enclosed shared office with separate workstations for each occupant to complete work tasks.

## RELATIONSHIP TO OTHER AREAS

- Case specific; reference office general module: office areas specific to each group

## RECOMMENDED CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

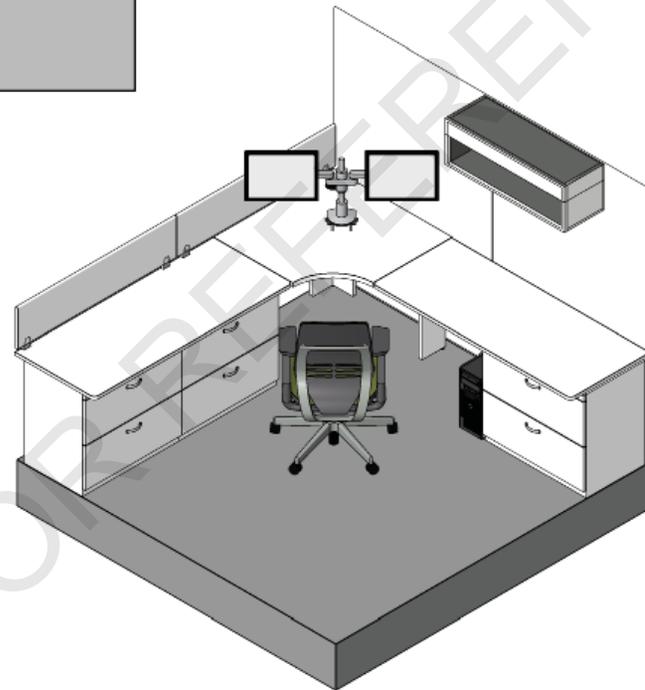

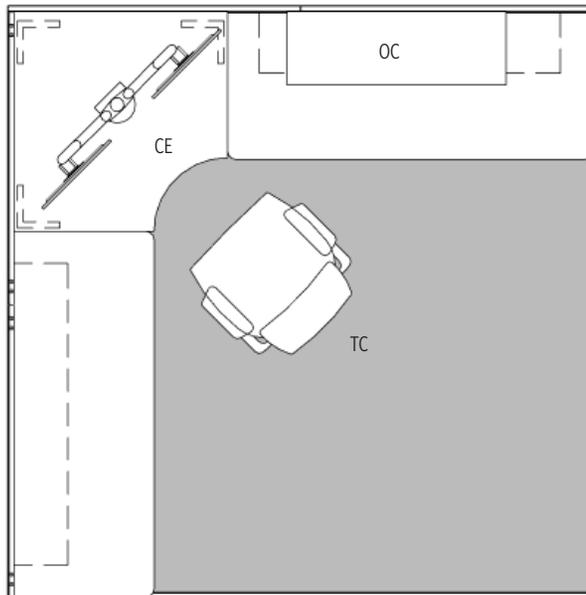

## TYPICAL EQUIPMENT/FURNISHINGS

- Task chair
- Sit/stand workstations
- Under surface vertical files
- Cabinets

## TYPICAL DESIGN FEATURES

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Carpet tile floor with rubber base for Administration or Operations areas (recommended)
  - ✓ Resilient floor covering with base for maintenance areas (recommended).
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" door with loadable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Daylighting: Exterior window or vision glass desired
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degree Fahrenheit
  - ✓ Cooling set point: 74 degree Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (35 foot candles average)
  - ✓ Provide (four minimum) general purpose duplex receptacles and a quad receptacle at each workstation
  - ✓ Provide one data outlet with four data ports at each workstation
  - ✓ Provide box and conduit rough-ins to three other locations in room
- Lighting Control:
  - ✓ Dimmable, indirect lighting with vacancy sensor
  - ✓ Task lighting (recommended)

## WORKSTATION - 64 SF

## FUNCTION

Open office workstation to complete work tasks.

## RELATIONSHIP TO OTHER AREAS

- Case specific; reference office general module: office areas specific to each group

## RECOMMENDED CRITICAL DIMENSIONS

- 9'-0" vertical clearance (minimum)

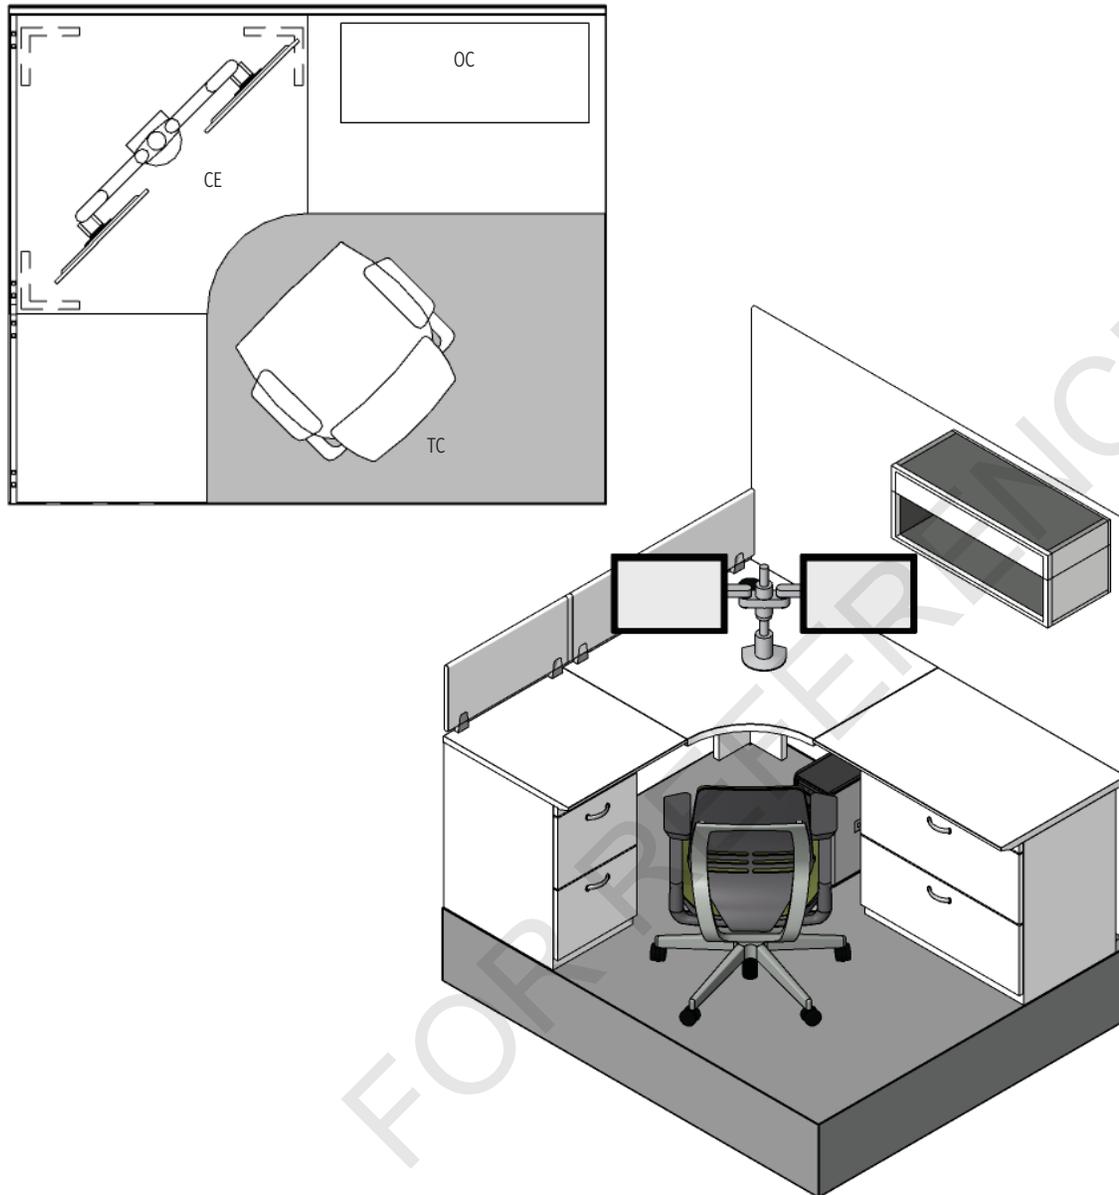

## TYPICAL EQUIPMENT/FURNISHINGS

- Task chair
- Workstation
- Under surface vertical files

## TYPICAL DESIGN FEATURES

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Carpet tile floor with rubber base for Administration or Operations areas (recommended)
  - ✓ Resilient floor covering with base for maintenance areas (recommended).
- Ceiling: Acoustical ceiling tile (recommended)
- Daylighting: Access to natural light
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED lighting in accordance with IES recommendation (35 foot candles average)
  - ✓ Provide (three minimum) general purpose duplex receptacles and a quad receptacle at workstation
  - ✓ Provide one data outlet with four data ports at workstation
- Lighting Control:
  - ✓ Verify feasibility of providing individual control of selected luminaires.
  - ✓ Task lighting (recommended as required)

## WORKSTATION - 36 SF

## FUNCTION

Open office workstation to complete work tasks .

## RELATIONSHIP TO OTHER AREAS

- Case specific; reference office general module: office areas specific to each group

## RECOMMENDED CRITICAL DIMENSIONS

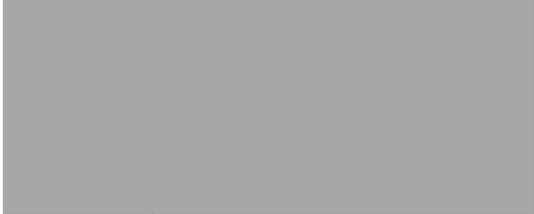

- 9'-0" vertical clearance (minimum)

## TYPICAL EQUIPMENT/FURNISHINGS

- Task chair
- Workstation
- Under surface vertical files
- Cabinets

## TYPICAL DESIGN FEATURES

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Carpet tile floor with rubber base for Administration or Operations areas (recommended)
  - ✓ Resilient floor covering with base for maintenance areas (recommended).
- Ceiling: Acoustical ceiling tile (recommended)
- Daylighting: Access to natural light
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED lighting in accordance with IES recommendation (35 foot candles average)
  - ✓ Provide (three minimum) general purpose duplex receptacles and a quad receptacle at workstation
  - ✓ Provide one data outlet with four data ports at workstation
- Lighting Control:
  - ✓ Verify feasibility of providing individual control of selected luminaires.
  - ✓ Task lighting (recommended as required)

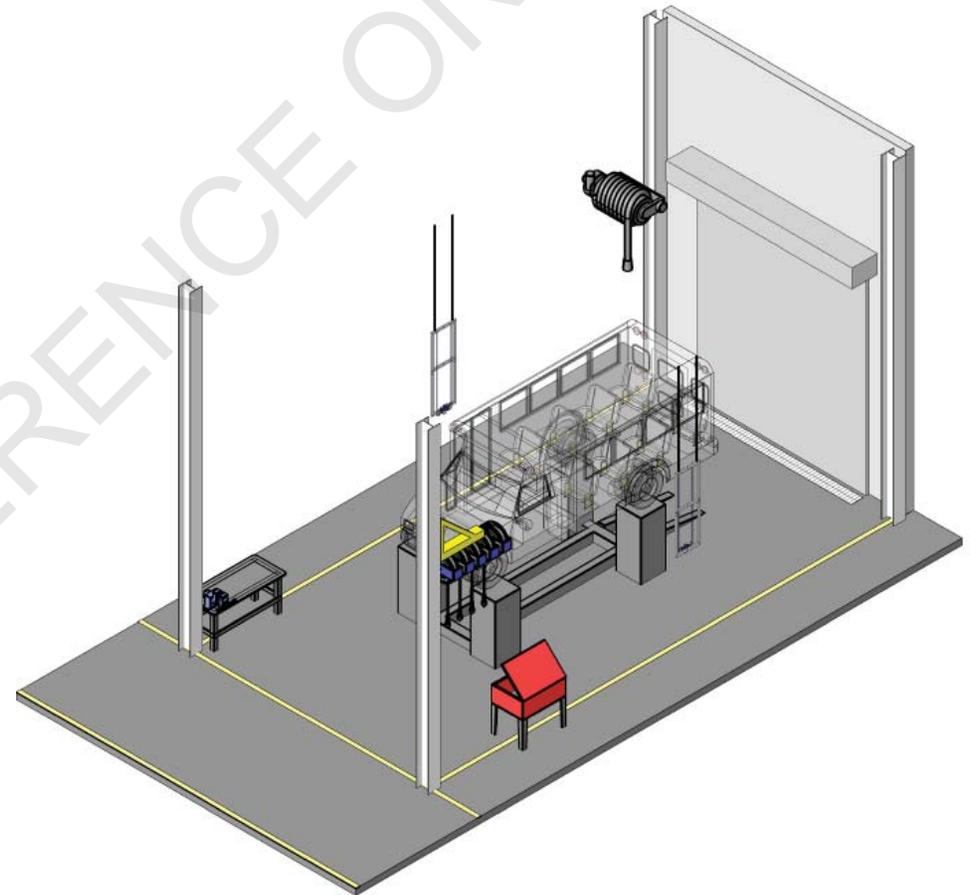

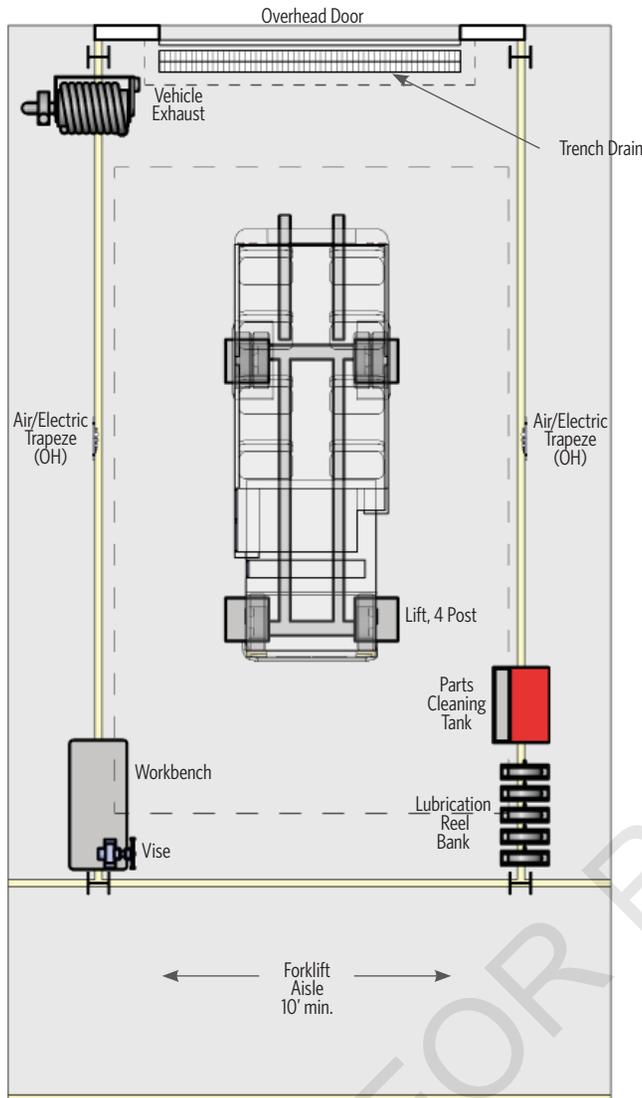

BAYS, SHOPS, & PARTS

FOR REFERENCE ONLY

MAINTENANCE BAYS

**MAINTENANCE BAYS**

**FUNCTION**

Perform general repair and maintenance on paratransit vehicles.

**RELATIONSHIP TO OTHER AREAS**

- Access to Common Work Area, Portable Equipment Storage, Tire and Brake Shop, Parts Room, and Office areas

**RECOMMENDED CRITICAL DIMENSIONS**

- 19'-0" vertical clearance to structure and fixtures
- 20'-0" wide x 40'-0" long

**TYPICAL EQUIPMENT/FURNISHINGS**

- Severe use workbench with vise (one per bay)
- Parts cleaning tank (shared)
- Lubrication reel bank (shared one per two bays)
- Vehicle exhaust (one per bay)
- Air/electric trapese

**TYPICAL DESIGN FEATURES**

- Forklift access
- Blend of lifts and flat floor bays
- Natural Daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities with light colored finish
- Doors:
  - ✓ Personnel door with view panel to meet applicable code exit requirements
  - ✓ Exterior overhead doors: High-lifting sectional, steel, insulated, 14'-0" x 14'-0" with view panels, automatic operator, interior and exterior push button controls with lockout on exterior
  - ✓ Bollards on exterior at jambs of overhead door (two each)

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- Wall mounted or overhead vehicle exhaust system with exhaust hose on a motorized reel with integral exhaust fan and automatic fan switch
- As required by equipment
- Ventilation:
  - ✓ Four air changes per hour continuous exhaust to clear any hazardous gas accumulation
- No heating devices with open flame or heaters with temperatures greater than 800 degrees Fahrenheit in Class 1 Division 2 rated areas (used for alternative fuels only)
- Heating set point: 65 degrees Fahrenheit
- In-floor radiant heat (if desired)

**PLUMBING CONSIDERATIONS**

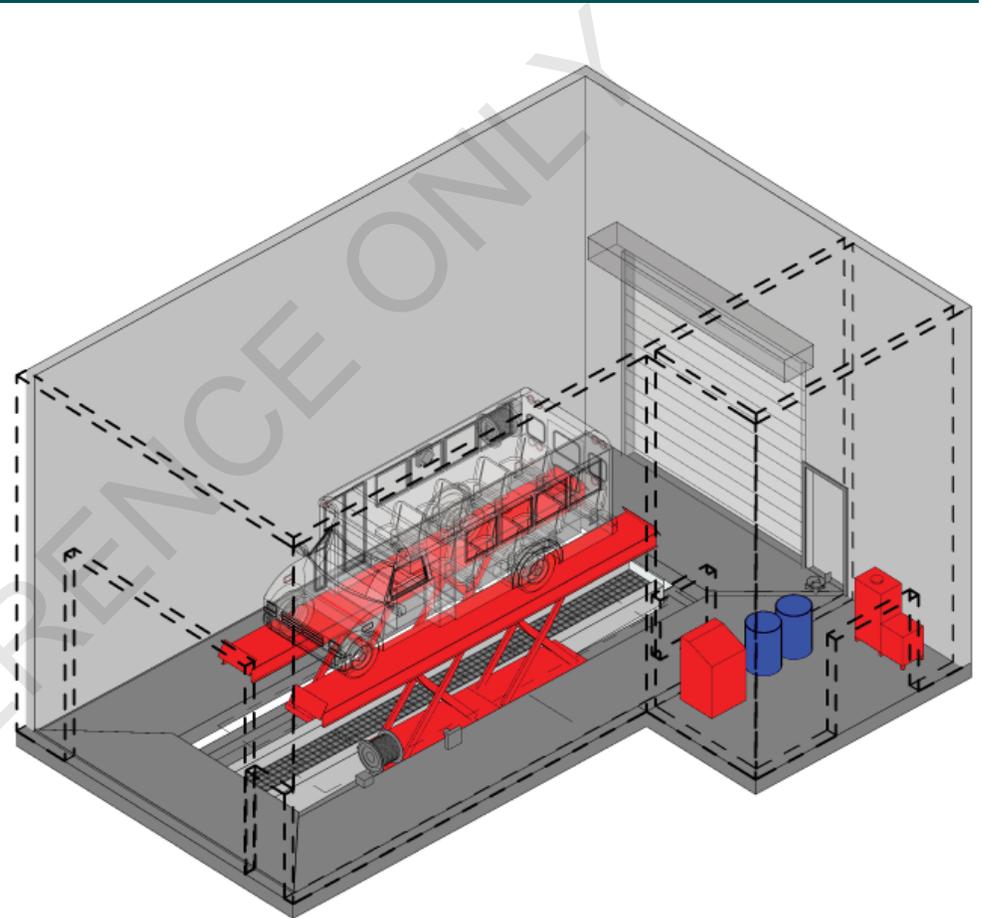

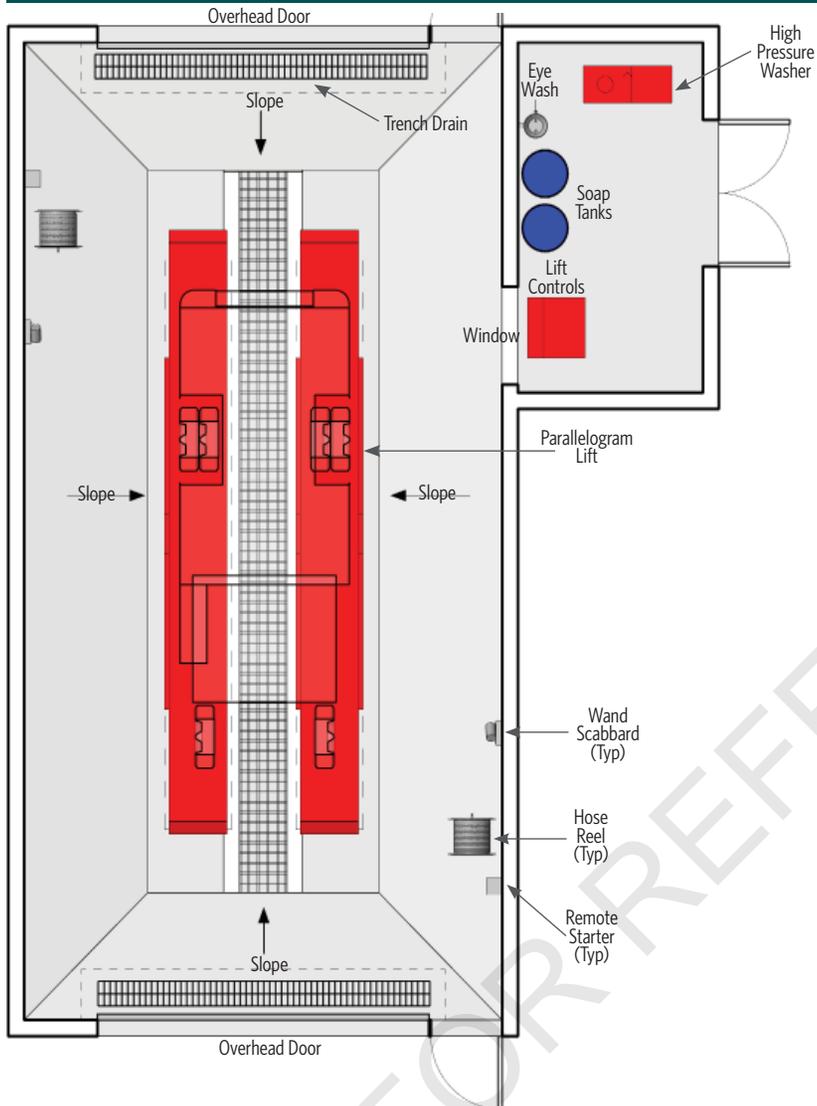

- Trench drain at overhead door with removable cover to central sediment and oil interceptor
- Lubrication reel bank (shared one per two bays)
- 3/4" water hose bibb with standard faucet at rear of bay 2'-0" AFF (one per three bays)
- Compressed air:
  - ✓ 2" compressed air piping loop (minimum)
  - ✓ Compressed air drops with cut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Lighting: LED lighting in accordance with IES recommendation minimum, 75 fc average, fixtures located to illuminate work spaces and around the vehicles
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide (four minimum) general purpose duplex receptacles on walls, columns, and between overhead doors
  - ✓ Dedicated computer receptacle, adjacent to data conduit on column adjacent to workbench
  - ✓ As required by equipment
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns at each bay

**CHASSIS WASH BAY**

**CHASSIS WASH BAY**

**FUNCTION**

Enclosed bay for washing of underside of paratransit vehicles before bringing into repair bays. Wash Equipment Room: A room adjacent to the Wash Bay for high pressure washer and soap drums

**RELATIONSHIP TO OTHER AREAS**

- Access to all other shop areas

**RECOMMENDED CRITICAL DIMENSIONS**

- 19'-0" vertical clearance
- 25'-0" wide x 40'-0" long

**TYPICAL EQUIPMENT/FURNISHINGS**

- Wand scabbard, wash controls, 50'-0" hose with reel
- Wash Equipment Room: High pressure washer and soap drum

**TYPICAL DESIGN FEATURES**

- Forklift access
- Natural Daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry with polyurea coatings treatment for wet and moisture protection
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities with light colored finish
- Doors:
  - ✓ Personnel doors with view panels to meet applicable code exit requirements
  - ✓ Exterior overhead door: Air operated, high lifting sectional, polycarbonate, 14'-0" x 14'-0", with view panels, automatic operator, interior and exterior push button controls and lockout on exterior
- Bollards on exterior jambs of overhead door (two each)

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structural grating over sump pit to accommodate H-20 loading
- Large grated sump with side drain for overflow
- Slope floor to trench drain and sump pit
- Structure as needed to support equipment

**MECHANICAL CONSIDERATIONS**

- Special ventilation to remove moisture, low air supply to eliminate steam
- Water resistant heating system
- In-floor radiant heating (if desired)
- As required by equipment
- Exhaust: Minimum 10 air changes per hour when wash equipment is activated. Minimum one air change per hour when wash equipment is inactive
- Heating set point: 55 degrees Fahrenheit

**PLUMBING CONSIDERATIONS**

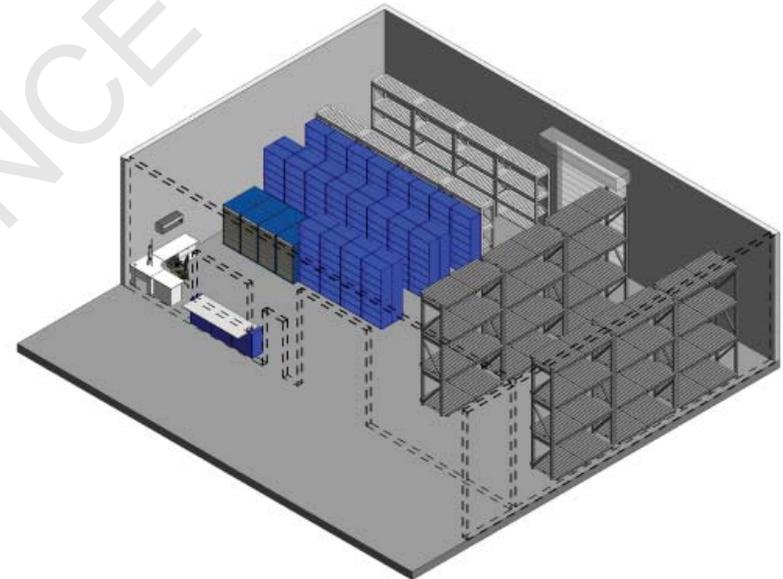

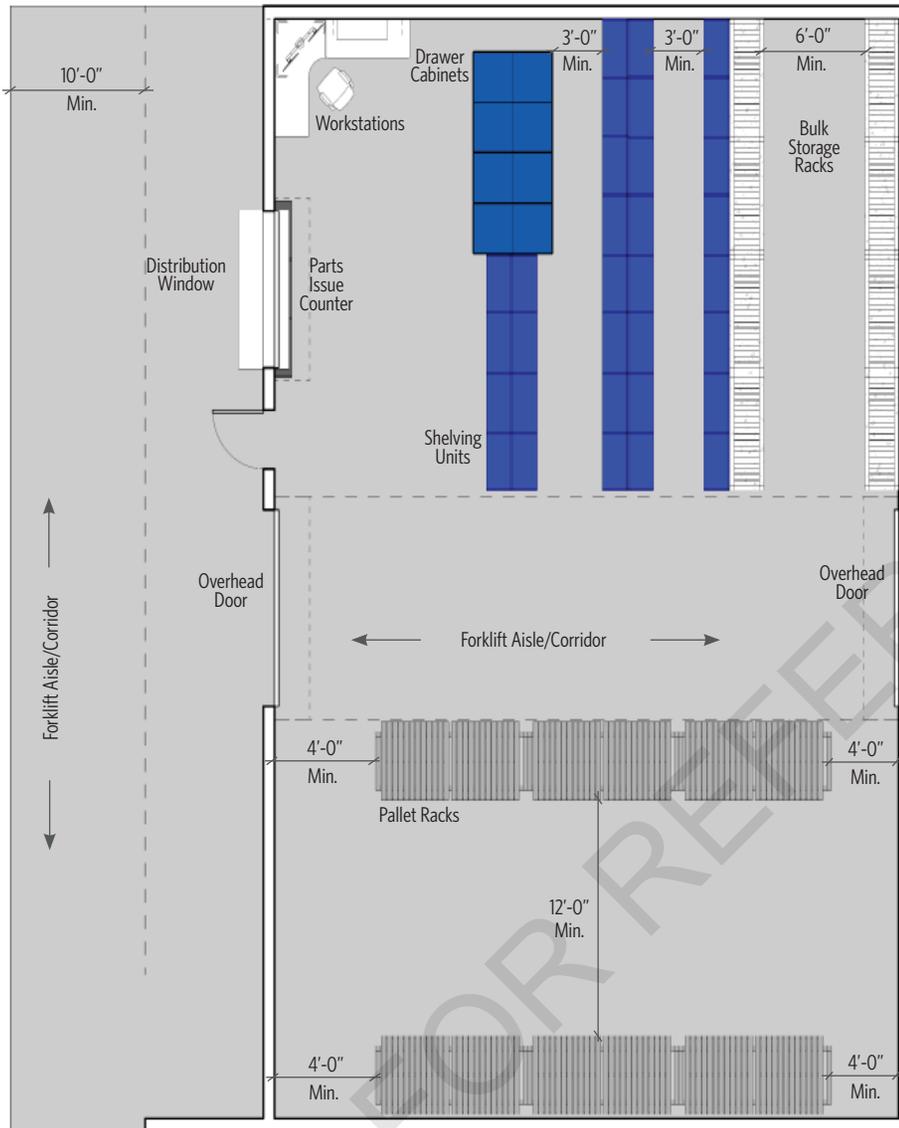

- Compressed air:
  - ✓ 2" compressed air piping loop (minimum)
  - ✓ As required by equipment
- Wash connections from high pressure washer to wand scabbard on both sides of bay
- Water connection to emergency eye wash/shower station
- Trench drain area (with removable cover) to central sediment and oil inceptor
- Large grated sump with side drain overflow to central sediment and oil inceptor
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Lighting: Sealed LED water tight lighting fixtures with no external reset device on walls, 20 fc average, fixtures located to illuminate work space and around vehicles
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide (four minimum) waterproof duplex receptacles on walls
- Communications: Paging/intercom system speakers

**PARTS ROOM**

**PARTS ROOM**

**FUNCTION**

Dedicated secure area for receiving, storage, and issuing of parts, material, and specialized tools

**RELATIONSHIP TO OTHER AREAS**

- Access to exterior for deliveries
- Access from Repair Bays and Shops

**RECOMMENDED CRITICAL DIMENSIONS**

- 12'-0" vertical clearance below mezzanine (min.)(if desired)
- 15'-0" vertical clearance above Mezzanine (min.)(if desired)
- 20'-0" clear for high bay pallet storage (min.)

**TYPICAL EQUIPMENT/FURNISHINGS**

- Shelves
- Bulk racks
- Pallet racks
- Cabinets
- High Density Drawer Units

**TYPICAL DESIGN FEATURES**

- Exterior access for deliveries
- Provide Issue Counter with stainless steel top and fire rated rolling overhead door
- Provide staging area for shipping/receiving with an overhead door to exterior of building
- Forklift access

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities with light colored finish
- Doors:
  - ✓ Personnel door with view panel to meet applicable code exit requirements
  - ✓ Exterior overhead door: High-lifting sectional, steel, insulated 10'-0" by 12'-0" with view panels, automatic operator, interior and exterior push button controls with lockout on exterior
  - ✓ Overhead door at Issue Window
  - ✓ Interior overhead door: coiling steel, 10'-0" by 12'-0", automatic operator, push controls, lockable

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- Cooling set point: 75 degrees Fahrenheit
- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- In-floor radiant heat (if desired)
- As required by equipment

**PLUMBING CONSIDERATIONS**

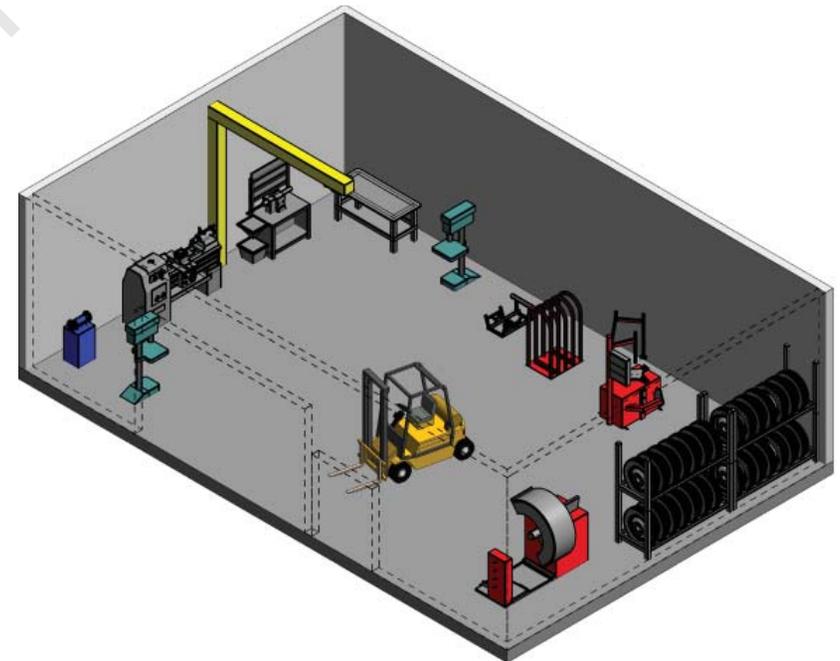

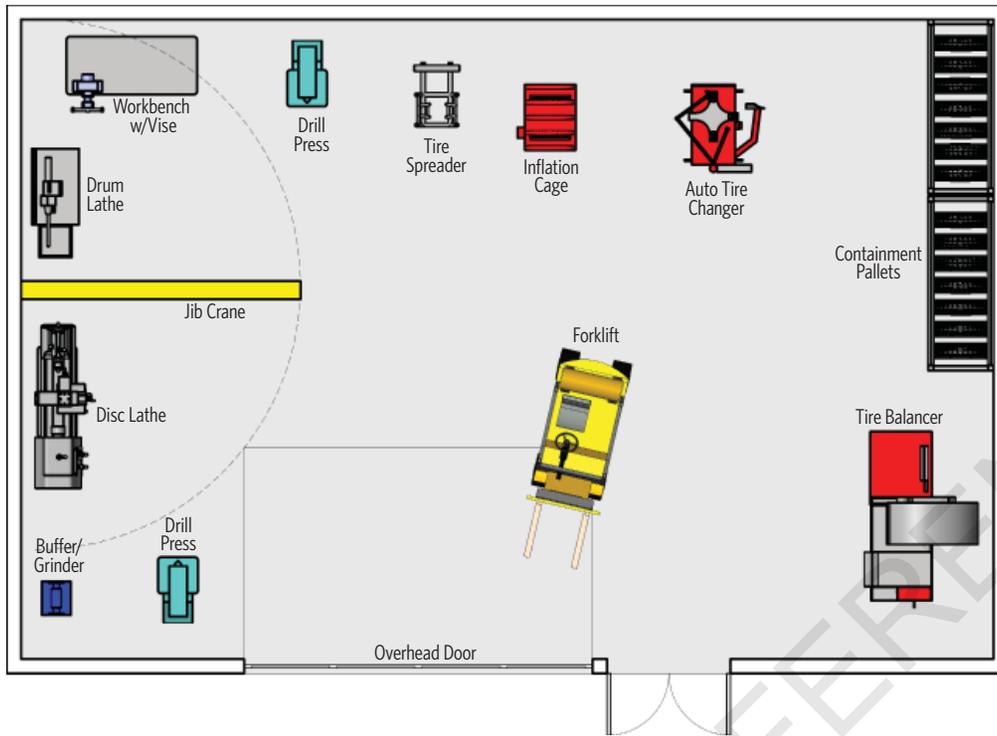

- Water: 3/4" water hose bibb with standard hose bibb at 2'-0" AFF
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Lighting: LED lighting in accordance with IES recommended lighting levels for Parts Window, Shipping/Receiving, and shopkeeper 35 fc average, Storage Area 20 fc average, fixtures located to illuminate work spaces
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide general purpose duplex receptacles on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

TIRE & BRAKE SHOP

**TIRE & BRAKE SHOP**

**FUNCTION**

Designated shop for repair of brake components, minor machining tasks and for turning brake drums. As well as repair, changing, balancing, and storage of tires.

**RELATIONSHIP TO OTHER AREAS**

- Access to Parts Room and Office areas
- Adjacent to Maintenance Bay

**RECOMMENDED CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

**TYPICAL EQUIPMENT/FURNISHINGS**

- Severe use workbench with vise
- Brake lathes with dust collection system
- Jib crane
- Tire balancer
- Auto tire changer
- Tire spreader
- Drill press
- Buffer/grinder
- Disc lathes
- Containment pallets
- Inflatable chamber

**TYPICAL DESIGN FEATURES**

- Forklift access
- Physically separated from other areas to prevent migration of noise, dirt and fumes, if possible
- Electronically secure entry
- Natural Daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry Ceiling: Painted exposed structure, ductwork, conduit and utilities with light colored finish
- Doors:
  - ✓ Personnel doors with view panels to meet applicable code exit requirements
  - ✓ Overhead door (if desired): High-lifting sectional, steel, insulated, 10'-0" by 10'-0" with view panels, automatic operator, interior and exterior push button controls with lock out on exterior

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- Mechanical: In-floor radiant heat (if desired)
  - ✓ Heating set point: 65 degrees Fahrenheit
  - ✓ General ventilation (per code)
  - ✓ Exhaust and makeup air for dust collection system
  - ✓ As required by equipment

**PLUMBING CONSIDERATIONS**

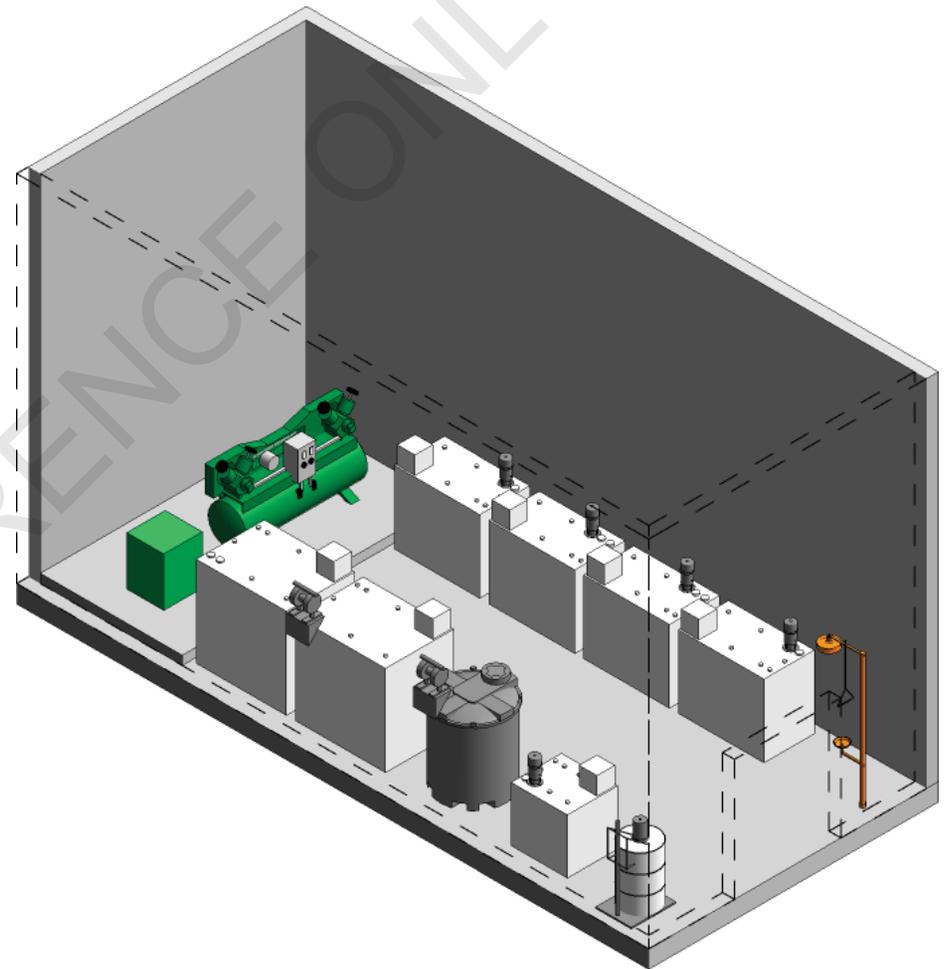

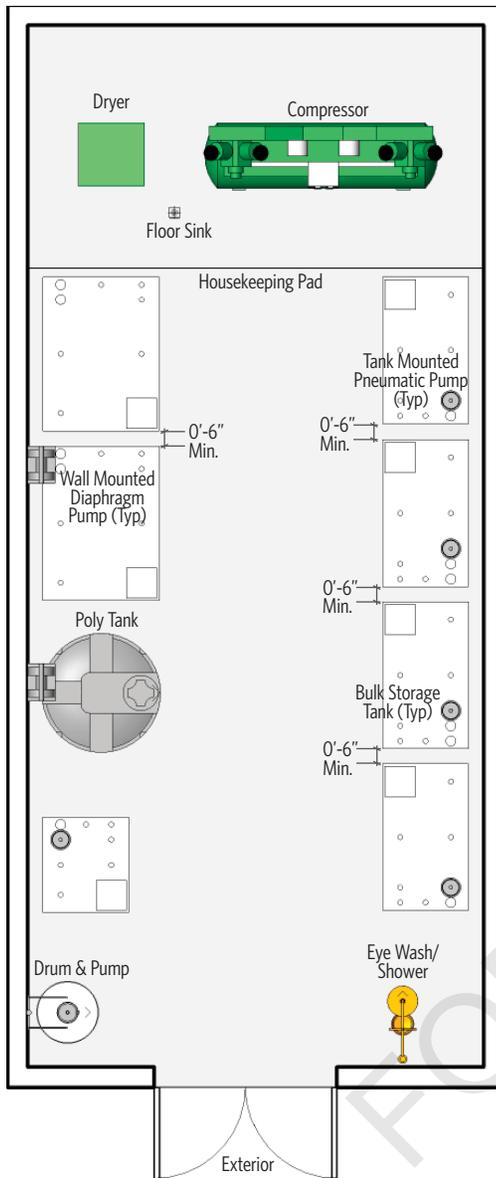

- Compressed air drop:
  - ✓ 2" compressed air piping loop (minimum)
  - ✓ Compressed air drops with cut-off valve, union separator, regulator with gauge, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- Water: 3/4" water hose bibb with standard hose bibb at 2'-0" AFF
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

- Lighting: LED lighting in accordance with IES recommendation minimum, 50 fc average, fixtures located to illuminate work spaces and around the vehicles
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide (four minimum) general purpose duplex receptacles on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

FLUID & COMPRESSOR

**FLUID & COMPRESSOR**

**FUNCTION**

Enclosed room for storage and central distribution of lubricants. Space shall include a compressor(s) and refrigerated air dryer(s).

**RELATIONSHIP TO OTHER AREAS**

- Access to exterior for deliveries

**RECOMMENDED CRITICAL DIMENSIONS**

- 12'-0" vertical clearance to structure and fixtures

**TYPICAL EQUIPMENT/FURNISHINGS**

- Above grade fluid storage tanks, air piston and diaphragm pumps, drums, and a poly tank
- Air compressor
- Refrigerated air dryer

**TYPICAL DESIGN FEATURES**

- Exterior access for deliveries
- Acoustically and physically separated from other areas to prevent migration of noise, dirt, and fumes

**ARCHITECTURAL CONSIDERATIONS**

- Finishes:
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry sound absorption material
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish sound absorption material
- Doors:
  - ✓ Personnel door with view panel to meet applicable code exit requirements
  - ✓ Double 6'-0" wide door with interior exit device
  - ✓ No thresholds
- Acoustics: Determine based on equipment and location of adjacent spaces

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- 6" housekeeping pad for both the air compressor and refrigerated air dryer
- Structure as needed to support equipment
- Containment pit for 110% of largest tank (per local code)

**MECHANICAL CONSIDERATIONS**

- Mechanical:
  - ✓ Heating set point: 55 degrees Fahrenheit
  - ✓ Exhaust: Minimum 1.0 CFM per square foot
  - ✓ Negative pressurization
  - ✓ As required by equipment

**PLUMBING CONSIDERATIONS**

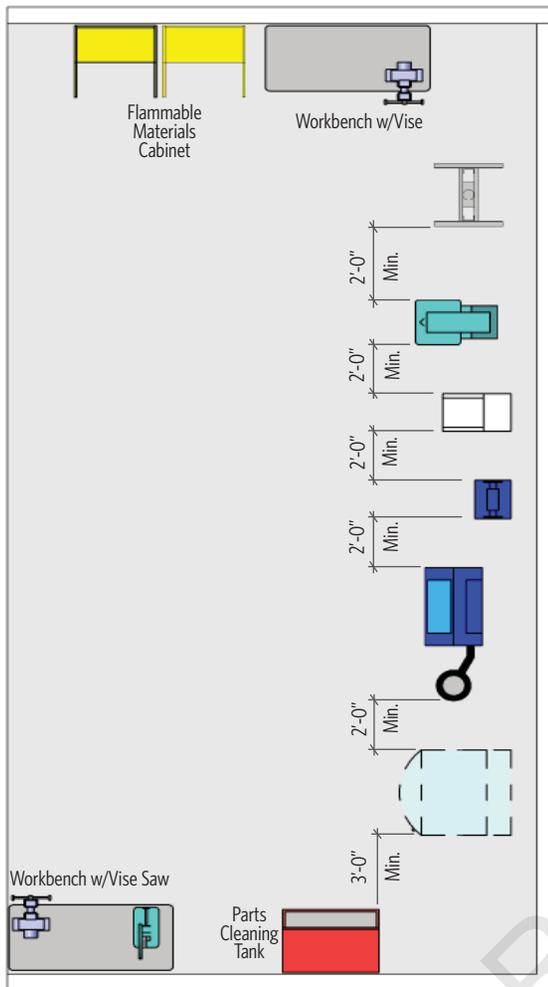

- Compressed air:
  - ✓ Duplex air compressor, air dryer, and air receiver
  - ✓ Floor sink between air compressor and dryer. Plumb to central sediment and oil interceptor
  - ✓ 2" compressed air piping loop (minimum) started in the Lube/Compressor Room
  - ✓ Compressed air line with 3/8" and 1/2" cut-off valve, separator, regulator with gauge, lubricator, and quick disconnect on wall at 4'-0" AFF
  - ✓ Connect to lubricant pumps
- Tank mount all piston lubricant pump(s)
- Wall mount all diaphragm pump(s)
- CG pump mounted to an air operated hoist (if required)
- Plumb tanks to corresponding lube reel banks located in the Repair Bays
- Plumb UO and UC tanks to corresponding pumps located in the Repair Bays (if required)
- 3/4" water hose bib with standard faucet 2'-0" AFF
- Emergency eyewash

**ELECTRICAL CONSIDERATIONS**

- Lighting: LED lighting in accordance with IES recommendation minimum, 25 fc average, fixtures located to illuminate work spaces
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide (four minimum) general purpose duplex receptacles on walls
  - ✓ Lube/Compressor: 25 fc
  - ✓ As required by equipment

EQUIPMENT & SUPPORT

Hydraulic Press

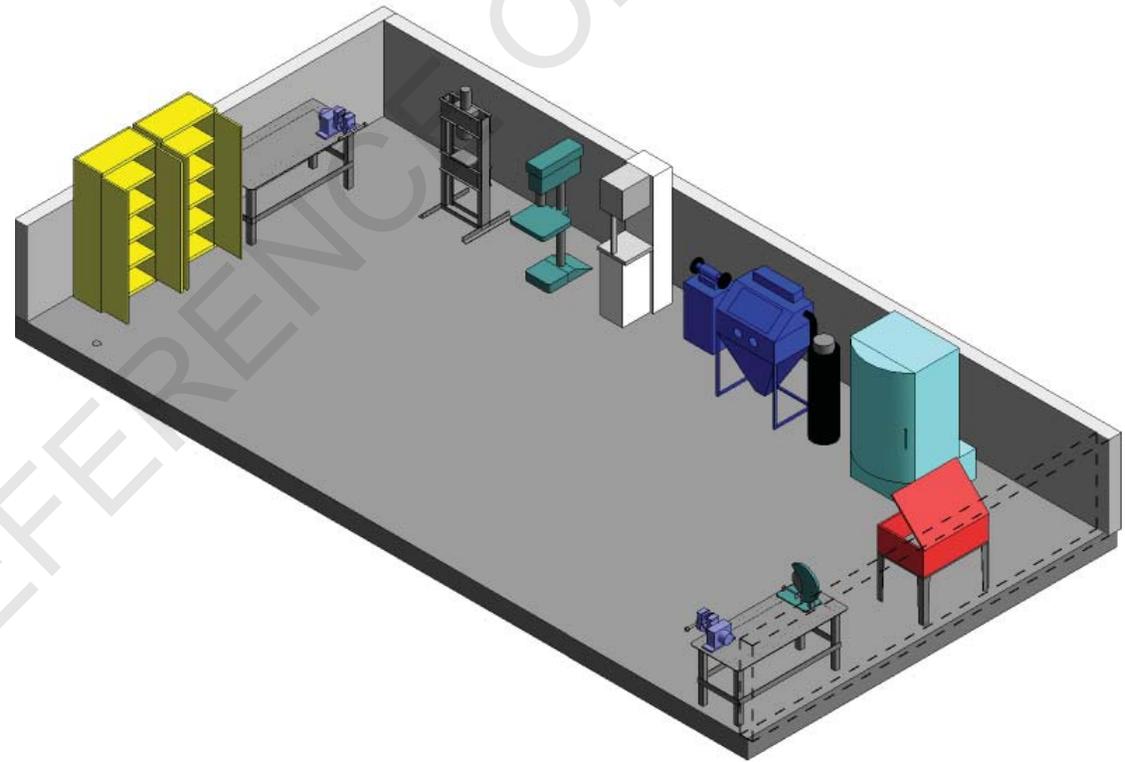

Drill Press

Bandsaw

Buffer/Grinder

Cabinet w/  
Dust Collector

Parts Washer

**EQUIPMENT & SUPPORT**

**FUNCTION**

Designated area for common fixed shop equipment which supports all repair bays and associated shop areas

**RELATIONSHIP TO OTHER AREAS**

- Access from Maintenance office areas
- Adjacent to Repair Bays, Parts Room, and Portable Equipment Storage

**RECOMMENDED CRITICAL DIMENSIONS**

- 12'-0" to vertical clearance to structure and fixtures

**TYPICAL EQUIPMENT/FURNISHINGS**

- Severe use workbench(es) with vise
- Buffer grinder with dust collector
- Hydraulic press
- Drill press
- Abrasive blast cabinet
- Horizontal bandsaw
- Cut-off saw
- Parts washer

**TYPICAL DESIGN FEATURES**

- Half-height 54" walls on 3 sides for utilities and to prevent blocking vision of shop from office areas and repair bays
- Forklift access
- Natural Daylighting desired

**ARCHITECTURAL CONSIDERATIONS**

- Finishes
  - ✓ Floor: Soil, grease, water, slip resistant concrete with integral non-metallic light reflective hardener, and chemical bonded concrete sealer
  - ✓ Walls: Soil and grease resistant, light colored finished concrete or masonry
  - ✓ Ceiling: Painted exposed structure, ductwork, conduit and utilities, light colored finish
- Doors: None

**STRUCTURAL CONSIDERATIONS**

- Control joints in floor slab at adequate spacing
- Structure as needed to support equipment
- Floor slab designed to accommodate in-floor radiant heat (if desired)
- Floor slab designed to accommodate forklift access

**MECHANICAL CONSIDERATIONS**

- Heating set point: 65 degrees Fahrenheit
- General ventilation (per code)
- In-floor radiant heat (if desired)
- As required by equipment

**PLUMBING CONSIDERATIONS**

- Compressed air drop:
  - ✓ 2" compressed air piping loop (minimum)
  - ✓ Compressed air drops with cut-off valve, union separator, regulator with gauge, lubricator, and quick disconnects on 4'-0" AFF
  - ✓ Provide disconnects for 3/8" and 1/2" impact tools at locations to be determined during detailed design
  - ✓ As required by equipment
- Water: 3/4" water hose bibb with standard hose bibb at 2'-0" AFF
- As required by equipment

**ELECTRICAL CONSIDERATIONS**

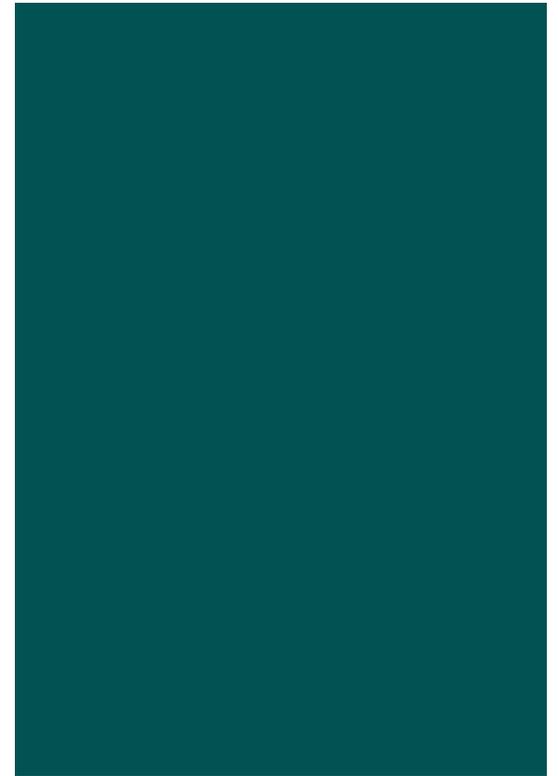

- Lighting: LED lighting in accordance with IES recommendation minimum, 50 fc average, fixtures located to illuminate work spaces
- Power:
  - ✓ All receptacles and outlets at 3'-6" AFF
  - ✓ Provide (ten minimum) general purpose duplex receptacles on walls and columns
  - ✓ Dedicated computer receptacle, adjacent to data conduit on wall or column
  - ✓ As required by equipment
- Communications:
  - ✓ Paging/intercom system speakers
  - ✓ Data conduit on columns and/or walls

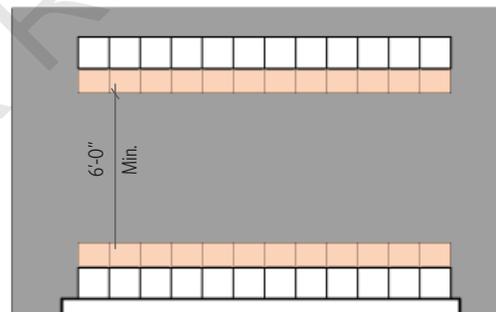

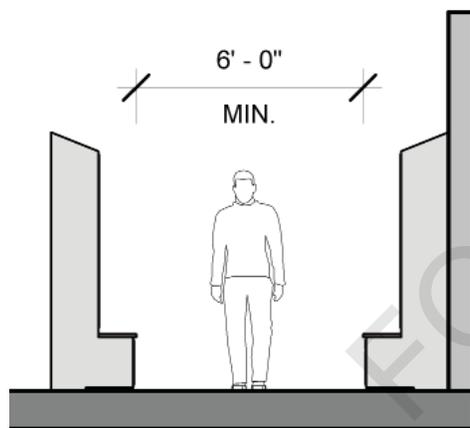

MAINTENANCE

FOR REFERENCE ONLY

**MEN'S & WOMEN'S LOCKERS**

**FUNCTION**

Locker area for each male and female Bus Maintenance employee.

**RELATIONSHIP TO OTHER AREAS**

- Access by Repair and Shop Areas
- Located within each Men and Women Restrooms

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

**TYPICAL EQUIPMENT/FURNISHINGS**

- 6-foot high gear, well-ventilated lockers with built-in bench

**TYPICAL DESIGN FEATURES**

- Flooring: Tile covering or finished concrete (recommended)
- Walls: Tile covering or painted masonry (recommended)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
- Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (15 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**DISPATCH WINDOW**

**FUNCTION**

Area for Operators to report, receive information, and write reports

**RELATIONSHIP TO OTHER AREAS**

- Adjacent to Driver Ready Room
- Adjacent to Dispatch

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

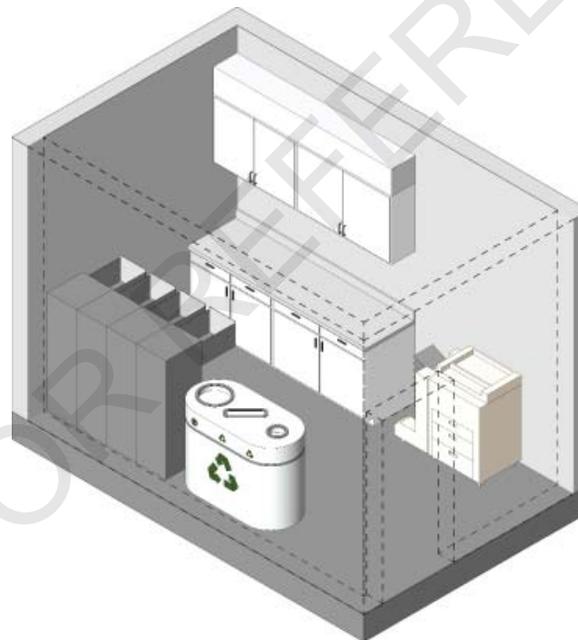

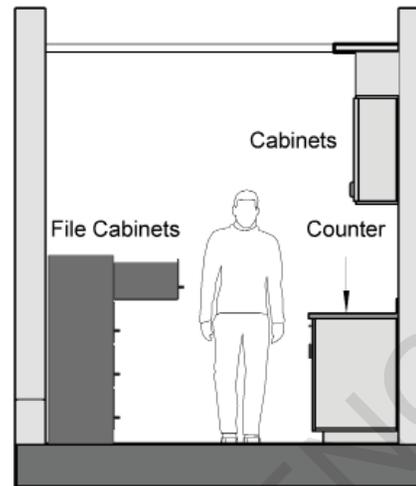

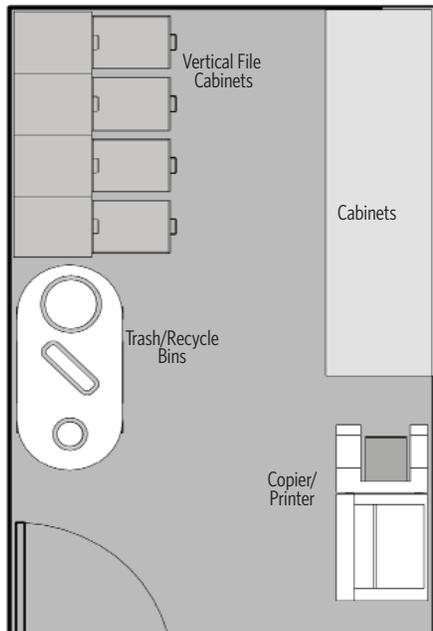

**TYPICAL EQUIPMENT/FURNISHINGS**

- Computer workstations
- Bulletin board
- Counter

**TYPICAL DESIGN FEATURES**

- Flooring:
  - ✓ Resilient floor covering with base or finished concrete (recommended)
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED lighting in accordance with IES recommendation (20 fc of indirect lighting average) (no glare)
  - ✓ Provide (three minimum) general purpose duplex receptacles
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**COPY/SUPPLY**

**FUNCTION**

Dedicated alcove or room for copier/printer/scanner/fax machine, storage for office supplies, and work surface

**RELATIONSHIP TO OTHER AREAS**

- Access to all office areas

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

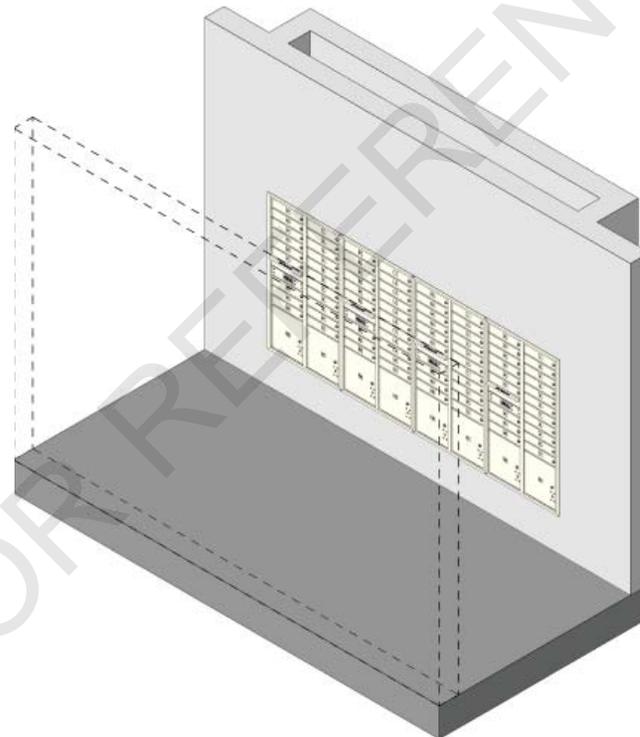

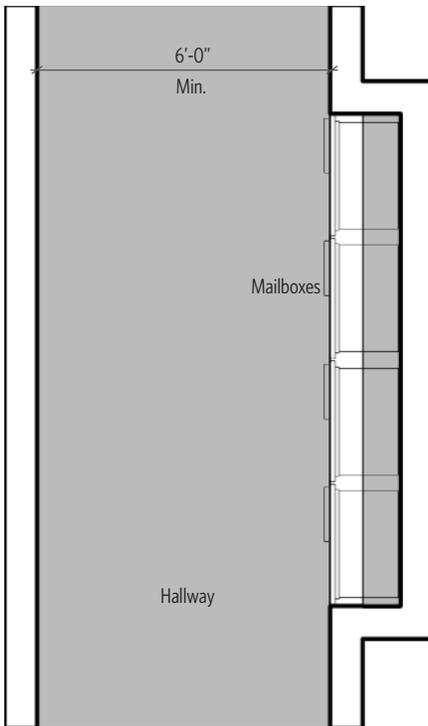

**TYPICAL EQUIPMENT/FURNISHINGS**

- Copier/printer/scanner/fax machine
- Work surface with cabinets below and above
- Filing cabinets

**TYPICAL DESIGN FEATURES**

- Flooring: Resilant floor covering with base or finished concrete
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" door with lockable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
  - ✓ Provide one data outlet with four data ports
  - ✓ Provide box conduit rough-ins to three other locations in the room
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**MAILBOX ALCOVE**

**FUNCTION**

Alcove area for staff and Post Man to drop off and pick up mail.

**RELATIONSHIP TO OTHER AREAS**

- Access to all office areas

**RECOMMENDED CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

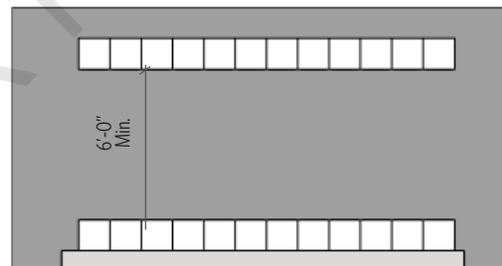

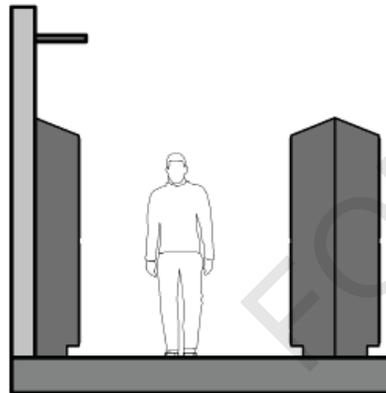

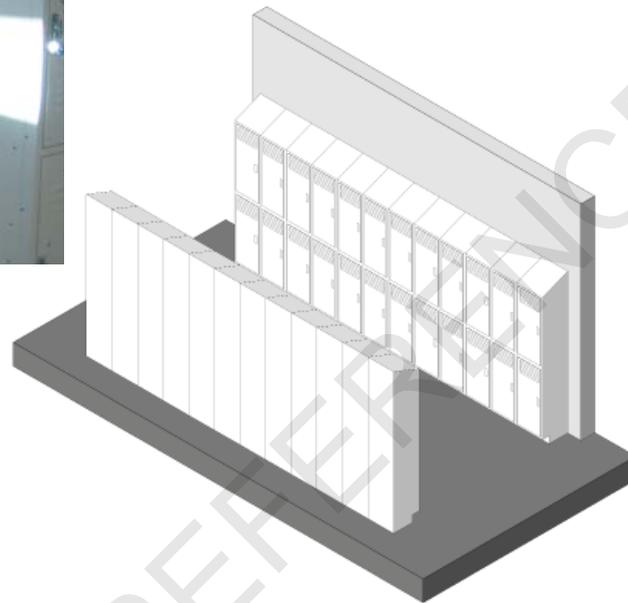

**TYPICAL EQUIPMENT/FURNISHINGS**

- Mailboxes

**TYPICAL DESIGN FEATURES**

- Flooring: Resilant floor covering with base or finished concrete
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" door with lockable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
  - ✓ Provide one data outlet with four data ports
  - ✓ Provide box conduit rough-ins to three other locations in the room
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**DISPATCH/CALL CENTER LOCKER ALCOVE**

**FUNCTION**

Alcove for the Operators to store personal gear and clothing in half-height lockers. Co-ed locker area, changing area in respective restrooms.

**RELATIONSHIP TO OTHER AREAS**

- Connected to Gilley Room
- Adjacent to Restroom/Showers

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

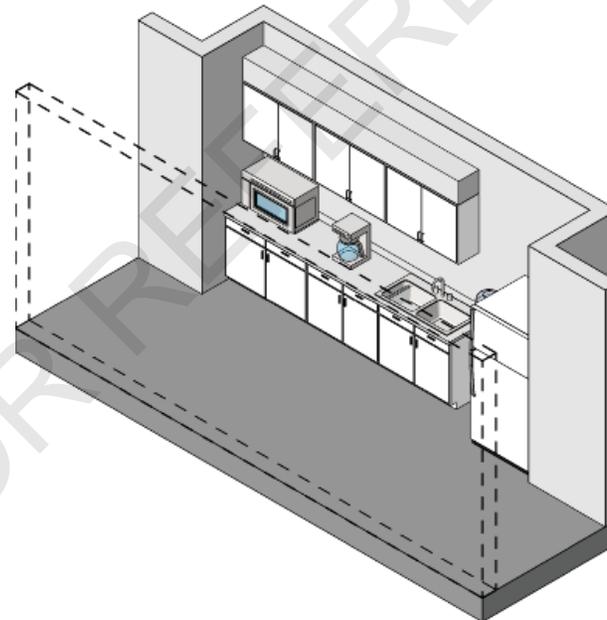

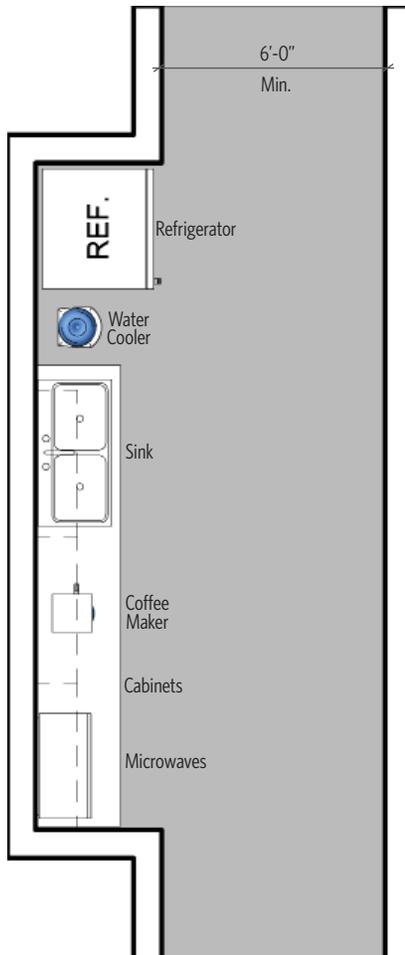

**TYPICAL EQUIPMENT/FURNISHINGS**

- Heavy duty, two tier, 3-foot, well-ventilated, half-height lockers; one each per Operator assigned to the facility

**TYPICAL DESIGN FEATURES**

- Flooring:
  - ✓ Tile covering or finished concrete (recommended)
- Walls: Tile covering or painted masonry (recommended)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
- Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**OFFICE COFFEE ALCOVE**

**FUNCTION**

Alcove for coffee to be stored

**RELATIONSHIP TO OTHER AREAS**

- Centrally located
- Access to all office areas, repair areas, and Restrooms

**RECOMMENDED CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

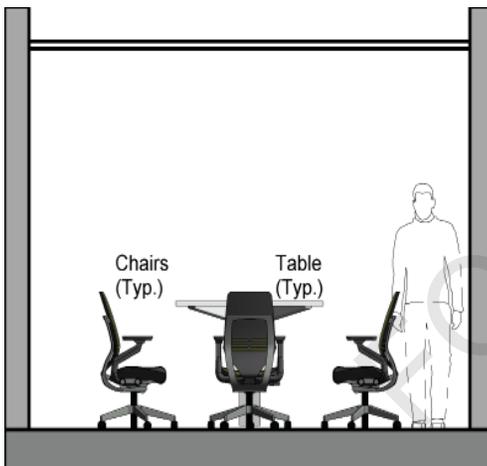

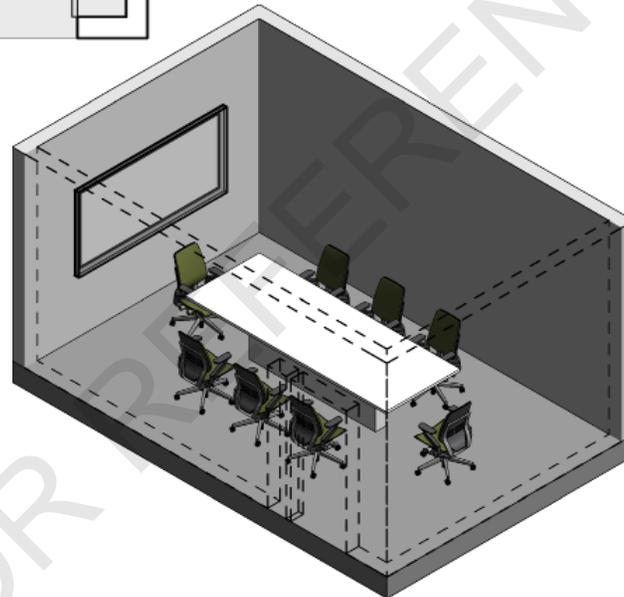

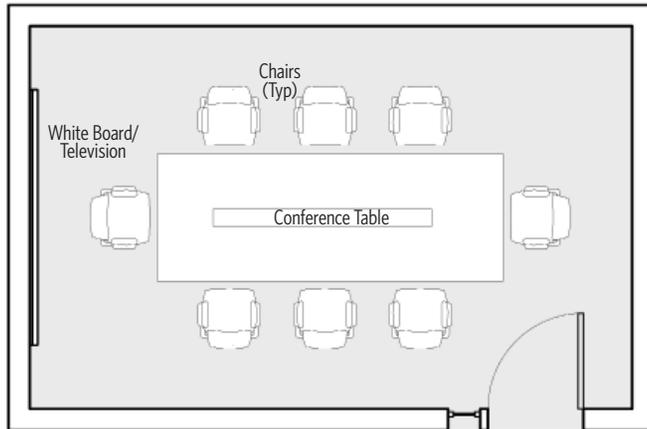

**TYPICAL EQUIPMENT/FURNISHINGS**

- Counter space, upper and lower cabinets, sink, microwaves, refrigerator, coffee maker, water filter, and water cooler

**TYPICAL DESIGN FEATURES**

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Resilient floor covering with base or finished concrete (recommended)
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Plumbing: rough in for equipment
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
  - ✓ Provide data outlets with four data ports (two minimum)
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

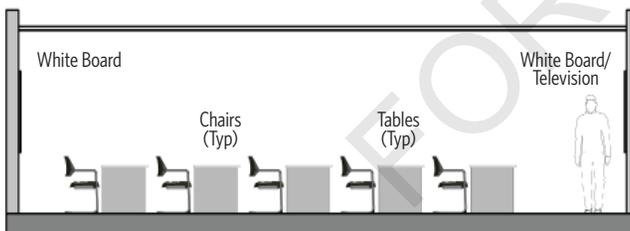

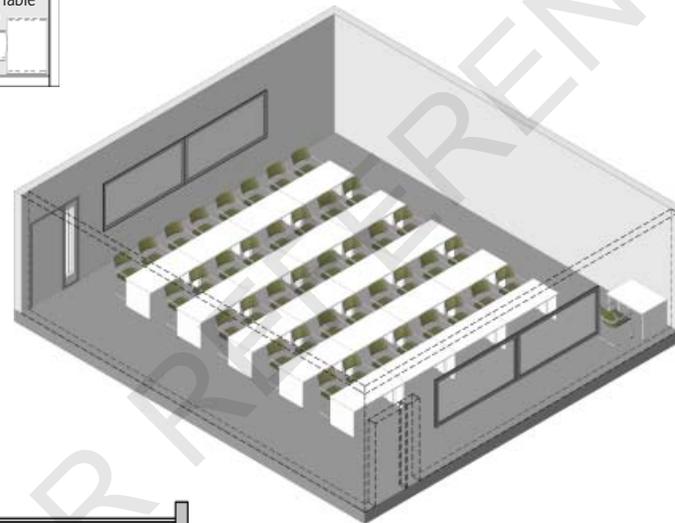

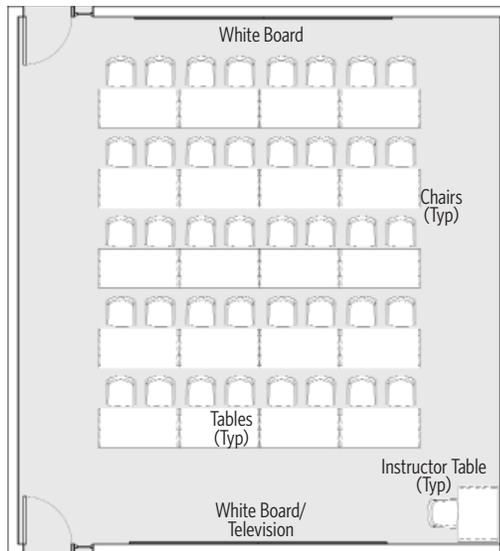

**CONFERENCE ROOM**

FUNCTION	
Room for up to a ten person meeting.

• White bo

**DRIVER READY ROOM/KITCHENETTE**

**FUNCTION**

Enclosed room used as a break area for staff.

**RELATIONSHIP TO OTHER AREAS**

- Centrally located
- Access to all office areas, repair areas, and Restrooms

**RECOMMENDED CRITICAL DIMENSIONS**

- 9' -0" vertical clearance (minimum)

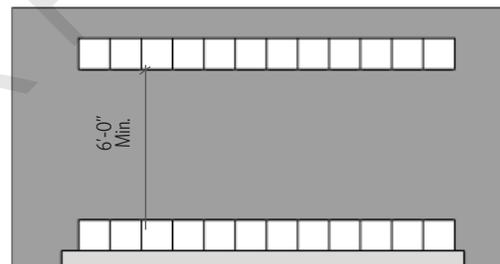

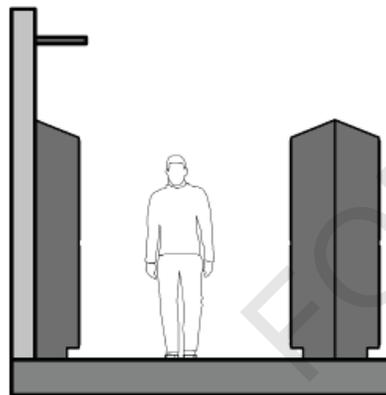

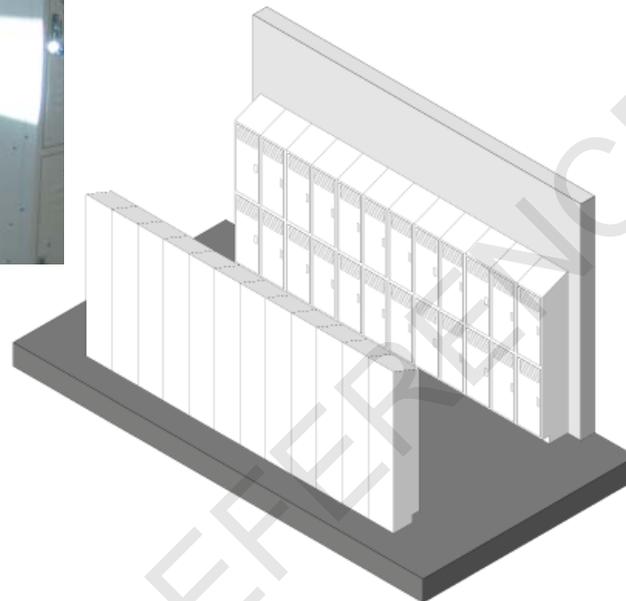

**TYPICAL EQUIPMENT/FURNISHINGS**

- Counter space, upper and lower cabinets, sink, microwave, refrigerators, coffee maker, ice maker, water filter, vending machines, water coolers, tables, chairs, trash/recycling/compost bins

**TYPICAL DESIGN FEATURES**

- Furniture: Use owner furniture standards (if applicable)
- Flooring:
  - ✓ Resilient floor covering with base or finished concrete (recommended)
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" doors (two minimum) with lockable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Daylighting: Exterior window desired
- Plumbing: rough in for equipment
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
  - ✓ Provide CO2 detection
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
  - ✓ Provide data outlets with four data ports (two minimum)
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**DRIVER MEN'S & WOMEN'S LOCKERS**

**FUNCTION**

Alcove for the Operators to store personal gear and clothing in half-height lockers. Co-ed locker area, changing area in respective restrooms.

**RELATIONSHIP TO OTHER AREAS**

- Connected to Gilley Room
- Adjacent to Restroom/Showers

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

**TYPICAL EQUIPMENT/FURNISHINGS**

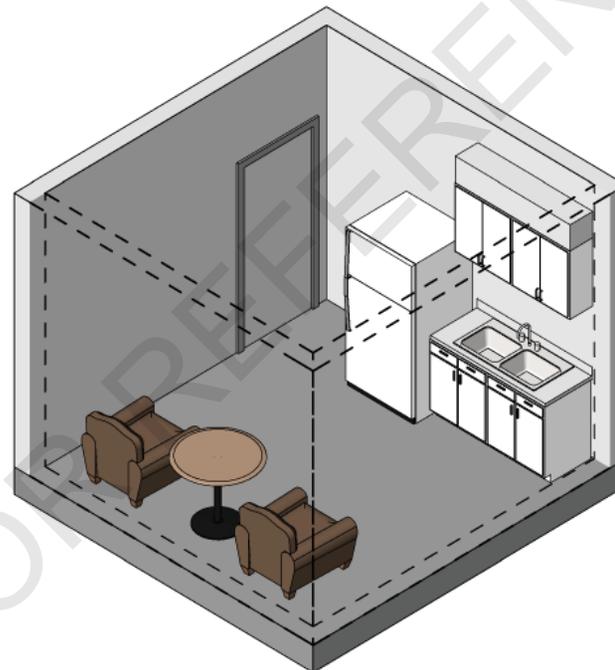

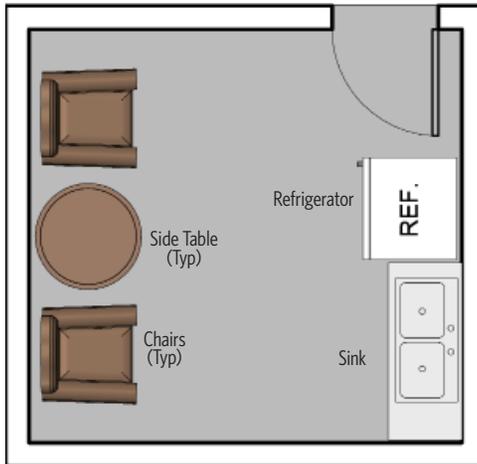

- Heavy duty, two tier, 3-foot, well-ventilated, half-height lockers; one each per Operator assigned to the facility

**TYPICAL DESIGN FEATURES**

- Flooring:
  - ✓ Tile covering or finished concrete (recommended)
- Walls: Tile covering or painted masonry (recommended)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile or painted exposed structure (recommended)
- Doors: Single leaf 3'-0" door
- Mechanical:
  - ✓ Provide appropriate balanced cooling, heating, ventilation, and exhaust (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED Lighting in accordance with IES recommendation (20 fc average)
  - ✓ Provide (six minimum) general purpose duplex receptacles
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

**LACTATION ROOM**

**FUNCTION**

Dedicated room for privacy to take care of personal matter and storage of first aid supplies.

**RELATIONSHIP TO OTHER AREAS**

- Accessible from department office areas

**RECOMMENDED CRITICAL DIMENSIONS**

- 9'-0" vertical clearance (minimum)

**TYPICAL EQUIPMENT/FURNISHINGS**

- Chairs
- Sink with countertops and cabinets
- Secure storage for equipment and supplies
- Side tables
- Refrigerator

**TYPICAL DESIGN FEATURES**

- Flooring:
  - ✓ Resilient floor covering with base or finished concrete (recommended)
- Walls:
  - ✓ Gypsum board on metal studs (typical) with wall finishes or painted masonry (optional gypsum board furring)
  - ✓ Wall protection as needed
- Ceiling: Acoustical ceiling tile (recommended)
- Doors: Single leaf 3'-0" door with lockable lever set hardware (recommended)
  - ✓ Electronically secured entry (as required)
- Plumbing: Rough-in for fixtures
- Mechanical:
  - ✓ Provide appropriate, balanced cooling, heating, and ventilation (per code)
  - ✓ Heating set point: 68 degrees Fahrenheit
  - ✓ Cooling set point: 74 degrees Fahrenheit
- Electrical:
  - ✓ LED lighting in accordance with IES recommendation (20 fc indirect lighting average)
  - ✓ Provide (three minimum) general purpose duplex receptacles
- Lighting Control:
  - ✓ Dimmable, indirect lighting with occupancy sensor
  - ✓ Task lighting (recommended)

3. Power Factor .....	9
Study Updates.....	10

## Introduction

SFPUC has submitted a request to Pacific Gas & Electric Co for a new primary electric service located on 2500 Mariposa St (Mix), San Francisco. The requested maximum net three phase electrical load demand for this service is estimated to be 7.8 MW. The customer’s proposed Commercial Operation Date (COD) is Q3 2023.

The System Impact Study (SIS) will analyze the:

1. Request by SFPUC to interconnect a new electrical load demand of 7.8 MW.
2. System reinforcements necessary to mitigate the adverse impacts of the new load.
3. Facilities required for system reinforcements with a non-binding good faith estimate of cost responsibility and a non-binding good faith estimated time to construct.

This SIS will form the basis by defining the scope, content, assumptions, and terms of reference.

The SIS assumes no additional generation, renewables or otherwise, will be installed at the site. Should SFPUC wish to install generation, renewable or otherwise, at the site in the future, an application is required pursuant to the WDT.

## Project and Interconnection Information

Table 1 below lists the general information about the Project as provided by the Customer.

Table 1: Project General Information

Project Location	2500 Mariposa St (Mix)
PG&E Planning Area	San Francisco
Maximum Load	7.80 MW
Power Factor	The Distribution Provider’s initially required corrected Power Factor (Section 20.4 of Tariff and Section 13.3 of this Service Agreement) will be as follows. Peak Load PF 95% @ 12:00 PM to 6:00 PM: ± 0.01 Minimum Load PF 95% @ 6:01 PM to 11:59 AM: ±0.02
Connection Voltage	12 kV
Primary Service Entrance	PG&E approved Phase and Ground protection

Figure 2: Electrical Single Line Diagram of Facility

## Study Assumptions

The infrastructure and protection evaluation will identify any new PG&E substation facilities or distribution upgrades necessary to interconnect the Customer's facility using the following assumptions:

1. The maximum net electrical load demand to be served at 2500 Mariposa St (Mix) is 7.80 MW.
2. The customer will engineer, procure, construct, own, and maintain its project facilities up to the intervening facility.
3. The study will consider all PG&E distribution projects in the Project vicinity.

PG&E has estimated a study fee of \$25,000 for performing the SIS based upon the scope of this study plan. The final cost to complete the SIS will be based on actual cost.

PG&E will provide the SFPUC a record of actual costs for performing this SIS roughly two months after the SIS is completed. PG&E will bill the SFPUC the remaining balance if the actual cost is higher than the estimated \$25,000. If the actual cost is less than the estimated study fee, PG&E will return the balance to the SFPUC within thirty (30) days of such determination.

**Evaluation of Distribution Interconnection**

PG&E's Distribution Planning Department evaluated the capability of the existing distribution system to serve the maximum load at 2500 Mariposa St (Mix).

**Infrastructure Scope and Feasibility:** To mitigate forecasted overloads triggered by the new primary service load, it is required to install and extend a new 12 kV distribution feeder from Potrero Substation. The scope is the following: installing a new 12 kV breaker and IPAC relay package at Potrero Substation, extending new mainline cable from the breaker to an existing 6" conduit system on Illinois St and 23<sup>rd</sup> St, installing ~9,500 ft of 1100 AL EPR in existing 6" conduits up to 17<sup>th</sup> St and Arkansas St, and trenching and installing additional 1100 AL EPR up to 17<sup>th</sup> and Hampshire St. Additional 1100 AL EPR will be installed along 6" conduits to land on a new 600 Amp switch – interrupter – switch in a #7 box. 600 AL EPR will be installed from the PG&E interrupter to the SFPUC interrupter to feed 2500 Mariposa St (Mix). A tie will be installed between each PG&E switch-interrupter-switch serving 2500 Mariposa loads.

Distribution reinforcement details are as follows:

<u>Install New Feeder at SF A Substation and Line Extension</u>	<u>\$ Cost</u>
<b><u>Direct Assignment Facilities:</u></b>	
<b>Tie-in Electric Service to New Feeder (12 months)</b>	
Install 600 Amp switch-interrupter-switch in #7 box	\$120,000
Trench and install ~20 ft of 600 AL EPR in 6" conduit + 6" spare	\$15,600
<b><u>Distribution Upgrades:</u></b>	
<b>Install New Substation Transformer (48 months)</b>	
Install 75 MVA 115/12 kV transformer and switchgear at SF A Substation (Ongoing)	\$0
Install new 12 kV bus section and switchgear at SF A Substation (Ongoing)	\$0
<b>Install New Feeder at SF A Substation and Line Extension (36 months)</b>	
Install new feeder breaker and associated IPAC relay package	\$950,000
Install 600 Amp 3-way 3-way switch	\$80,000
Trench and install ~300 ft of 1100 CU LSZH + 3 6" spare conduits	\$330,000
Trench and install ~200 ft of 1100 AL EPR in 6" conduit + 3 6" spares	\$156,000
Install ~9,500 ft of 1100 AL EPR in existing 6" conduit	\$5,700,000
Trench and install ~2,900 ft of 1100 AL EPR in 6" conduit + 6" spare	\$2,262,000
Install ~600 ft of 1100 AL EPR in 6" conduit	\$360,000
Estimated Cost	<b>\$9,973,600</b>

- WORK REQUIRED

## Cost Estimates

Costs provided in this report are non-bMixing good faith cost estimates only. These costs have little degree of accuracy and are provided for informational purposes only.

Cost estimates will be provided, if applicable, when the Project progresses to the Facilities Study. Charges for implementing these interconnections and facility modifications, if the SFPUC decides to proceed, will be made based upon the actual costs incurred.

## Ownership of Facilities

If this SIS determines that equipment needs to be installed in SFPUC's facilities, such installation will be the responsibility of SFPUC. Any equipment found to be required within PG&E's facilities will be the responsibility of PG&E, and the terms of the WDT will determine who is financially responsible to pay for such equipment.

## Technical Requirements

In addition to interconnection requirements listed in this SIS, the electric and gas service requirements, and policies for establishing electric or gas service for new or remodeled customer installation are detailed in PG&E's Greenbook. The PG&E Greenbook provides detailed connection requirements for grounding and safety, among other requirements. A copy of the PG&E Greenbook can be downloaded under the following website: <http://www.pge.com/greenbook/>

### 1. Metering

Metering will be measured at the "change in ownership" point. It is the responsibility of SFPUC to provide the necessary structures, substructures, foundations, and disconnect switches for mounting and connection of the metering transformer. The meter location and grounding must meet all the requirements of IEEE80 for equipment safety and touch and step potential protection. Specific design details should be presented for review and approval prior to construction.

### 2. Voltage Regulation

SFPUC should specify tap ratios for its transformers to support appropriate low-side voltage.

### 3. Power Factor

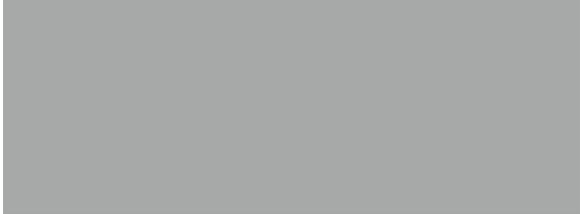

SFPUC will be obligated to meet its power factor requirements as outlined in WDT.

## **Study Updates**

The SIS will be performed in accordance with the assumptions listed in the Section titled “Study Assumptions”. If these assumptions become invalid, an updated study may be required to re-evaluate SFPUC’s interconnection impact on PG&E’s electric distribution system. Changes that might prompt an updated study are:

1. Change in the interconnection date or the timing of subsequent load additions.
2. Change in the projected amount of initial load or subsequent loads.
3. Change in the interconnection plan.

The SFPUC would be responsible for paying for any such updating study.

APPENDIX I:  
SDAT REVIEW LETTER 1.19.2023  
(FOR REFERENCE)

# SDAT REVIEW LETTER

Date: 1/19/2023

*Project Address:* 2500 Mariposa Street  
*Planning Record Number:* 2019-021884PRJ  
*Assigned Planners:* Mat Snyder, Gabriela Pantoja, Jennifer McKellar, Trent Greenan, Patrick Race

The Street Design Advisory Team (SDAT) provides design review and guidance to projects working within the City’s public right-of-way. SDAT is composed of representatives from the San Francisco Planning Department (SF Planning), the San Francisco Fire Department (Fire), San Francisco Public Works (Public Works), the San Francisco Municipal Transportation Agency (SFMTA), and the San Francisco Public Utilities Commission (SFPUC).

### SDAT REVIEW HISTORY:

1st Review	2nd Review	3rd Review
May 11, 2020	November 15, 2022	

Below are the SDAT comments from the 2nd SDAT review.

### PROJECT DESCRIPTION:

The proposal is to rebuild, expand, and modernize the Potrero Yard Muni Bus Maintenance Facility located at 2500 Mariposa Street, (bounded by Mariposa Street, Hampshire Street, Bryant Street and 17th Street), and replace it with an approximately 145-foot, mixed-use building with a four-story bus garage and eight levels of residential for a total area of 1,300,000 square feet. Of the 1,300,000 square feet, 723,000 square feet will be dedicated to the public facility, 544,000 square feet for the residential use (575 dwelling units), and 33,000 square feet of commercial space at the ground floor. The proposal includes two new curb cuts along Mariposa Street, new ADA ramps at all four intersections, 42 street trees, 37 Class 2 bicycle parking spaces, and three new bulbouts.

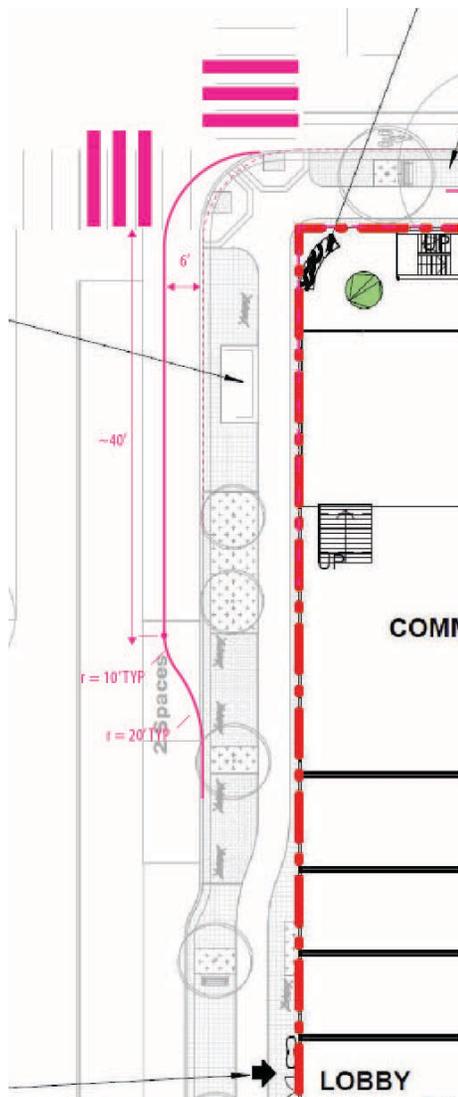

### CONDITIONS REQUIRING STREET DESIGN REVIEW:

- Planning Code [138.1](#) (required streetscape improvements per the [Better Streets Plan](#))
- Vision Zero
- Other:

**SDAT COMMENTS**

**1. Bulbout (required per Planning Code Sec. 138.1)**

- SDAT appreciates the addition of bulb-outs projecting into Bryant Street and Hampshire Street at the Mariposa Street intersection, and projecting into Hampshire Street at the 17<sup>th</sup> Street intersection, per May 11, 2020, SDAT comments. Given the high volume of bus movements to/from the project site, it is critical that all bulbs are analyzed for bus turning movements – particularly right turns from southbound Hampshire Street to westbound Mariposa Street (and into bus yard entry), from westbound Mariposa Street to northbound Bryant Street and from eastbound 17<sup>th</sup> Street to southbound Hampshire Street.
- SDAT recommends coordinating with SFMTA to confirm future plans for the bus stop at this intersection and installing a transit bulb out projecting into Bryant Street at the 17<sup>th</sup> Street intersection if the bus stop will remain. This may require the shifting of loading south of the transit bulb. Please coordinate with SFMTA on the layout and provision for a transit shelter, if applicable.

*Transit Bulb into Bryant Street at SE corner of 17th Street*

- The project is responsible for any utility work associated the construction of the bulb-out including potential work related to the relocation of the high-pressure fire hydrant shut-off valve if needed.
- Turn Templates: With your next submission to SDAT, please submit the following turn templates for all bulbouts and intersections. Note that turn templates must be approved by SDAT prior to Planning entitlement.
  - AASHTO 2011 WB-40
  - AASHTO Bus 45
  - Custom SFMTA 60’ Bus
  - Custom SFFD Engine
  - Custom SFFD Ladder

<b>Follow-up for Bulbouts</b>	Pre-entitlement/Next SDAT <ul style="list-style-type: none"> <li>• Sponsor to submit revised plans to SDAT showing required bulbout(s) as any relevant turn templates</li> <li>• Bulbout curb returns shall conform to SF Public Works’ Standard Plan for Curb Bulbs. See: <a href="http://sfpublicworks.org/sites/default/files/87%2C175.pdf">http://sfpublicworks.org/sites/default/files/87%2C175.pdf</a></li> </ul>
	Pre- or Post-entitlement <ul style="list-style-type: none"> <li>• Obtain relevant permits from BSM <a href="http://www.sfpublicworks.org/services/permits">www.sfpublicworks.org/services/permits</a></li> </ul>

**2. 17<sup>th</sup> St Street Frontage**

- SDAT has significant concerns about the pedestrian and bicycle experience and safety along the 17<sup>th</sup> Street frontage, given how the building is designed now with a blank wall and inactive frontage. This is especially concerning given that this is the frontage facing onto the park, and given how unsafe and unpleasant blank frontages on existing MTA facilities already have proven to be today (e.g., 15<sup>th</sup>, 16<sup>th</sup>, and Folsom Street frontages of the nearby Flynn Division, the Masonic Ave frontage of Presidio Yard, the Indiana St frontages of Woods Yard, and the San Jose and Ocean Ave frontages of Cameron Beach Yard).
- Given that this project is both a major and a public development project, its streetscape design should lead by example and be a model of the most up-to-date street design best practice. SDAT draws your attention to the following from the Better Streets Plan’s governing Admin Code 98.1(d)(10): “Major new developments, both public and private, often include the rebuilding of portions of public right-of-ways and should serve as models of the Better Streets Policy. Special efforts should be made to ensure that such new developments lead by example. *Public projects should establish model street and open space designs and private projects should incorporate stronger street design and landscaping standards.*” If an inactive façade on 17<sup>th</sup> Street is unavoidable, the sidewalk and building façade design of 17<sup>th</sup> Street should be a model for how to design an important street with an inactive façade.
- We strongly encourage exploring all avenues for targeted building program and design modifications that could enable more active use of the 17<sup>th</sup> Street ground-floor. If the bus ramps are the primary barrier standing in the way of activation of 17<sup>th</sup> Street as currently designed, any feasible way to shift them inward should be explored, if it has not been already. Shifting them ~30’ to the next structural bay would be ideal, if at all possible, and could even allow another liner of housing.
- At minimum, we request that you clearly describe and illustrate the design intent for the 17th Street frontage if active uses are not practical for the entirety of the frontage given the various requirements of the Project.

**3. Accessible Curb Ramps (Required per Public Works Order No: 185854 ) and Accessibility Requirements**

- The project is required to upgrade/install accessible pedestrian ramps at all street corners with existing curb ramps that do not comply with current City Standards, including the midblock crossing along Mariposa at York Street.
- See exhibit below for which illustrates red circles at curb ramp locations triggered by the project. Submit Existing Curb Ramp Inspections and corresponding photographs for all existing curb ramps proposed to remain as part of Street Improvement Permit.
- Construct new SE-R and NE-L curb ramps at York and Mariposa as part of this project. Revise site plan to show 6 directional curb ramps at this intersection. The midblock crosswalk(s) at York should be marked on the project plans.
- Public Works Order 184,350 requires sponsors installing ADA-compliant curb ramps at crosswalks to install receiving ramps at the opposite end of the crosswalk if none exist or if an existing ramp does not comply with current City standards. In addition to the ramps required along the project frontage, the project sponsor will be required to install new ramps on the receiving end of each crossing, if the existing receiving ramps do not comply with current City Standards.

**Sidewalk Encroachments and Standard Paving Materials**

- Set back elements from private plazas including benches so they do not encroach into the Public ROW. Revise design of the Bryant Street sidewalk accordingly to remove encroachments.
- Revise design to provide SF City Standard Sidewalk Paving Material from back of walk to the furnishing zone of the sidewalk. Eliminate proposed change in material at frontage zone. If the planned need is sidewalk tables and chairs, that can be handled with an approved BSM Tables and Chairs permit and movable pedestrian diverters.
- Remove proposed building frontage zones from sidewalk adjacent to bus stops and passenger loading zones. Building frontage zones may be problematic at these areas due to higher pedestrian use and potential for congestion.

Follow-up	Pre-entitlement/Next SDAT <ul style="list-style-type: none"> <li>• Show conceptual ramp locations in future SDAT submittal.</li> </ul>
	Pre- or Post-entitlement <ul style="list-style-type: none"> <li>• Meet with the Public Works Disability Access Coordinator’s Office to ensure ramp designs meet City standards. (Public Works Standard Curb Ramp Plans)</li> <li>• Obtain relevant permits from BSM</li> </ul>
Contacts	Karina Lairet ( <a href="mailto:karina.lairet@sfdpw.org">karina.lairet@sfdpw.org</a> ), Public Works Disability Access Coordinator’s Office

**4. Curb Cuts (Required by Public Works and SFMTA)**

- City policy prohibits curb cuts the sole purpose of which are used to transfer trash bin to and from the curb. Remove the proposed curb cut for waste collection on Hampshire Street.

**5. Driveways & Garage Access**

- Turn Templates: With your next submission to SDAT, please submit the following turn templates for all access points for buses into and out of the bus yard from Mariposa Street. Note that turn templates must be approved by SDAT prior to Planning entitlement.
  - AASHTO Bus 45
  - Custom SFMTA 60’ Bus
  - Other expected design vehicle

Follow-up for curb cuts, driveways & garage access	Pre-entitlement/Next SDAT submittal <ul style="list-style-type: none"> <li>• Submit loading demand analysis and loading operations plan</li> <li>• Submit turn templates for design vehicle</li> </ul>
Contacts	Coordinate with your assigned Planner

**6. On-street Loading**

- It is unclear to SDAT who the on-street commercial loading is for on the south side of Mariposa Street and the east side of Hampshire Street.
- Commercial Loading: please detail commercial loading space lengths and intended design vehicle in next plan submittal.

- Passenger loading zones shall comply with accessibility requirements. Revise site plan to show proposed passenger loading zones (white curb) and revise layout to comply with Standard Accessible Passenger Loading Zone Drawings at the link below:  
[https://sfgov.org/mod/sites/default/files/Documents/Bulletin10\\_PassengerLoadingZones.pdf](https://sfgov.org/mod/sites/default/files/Documents/Bulletin10_PassengerLoadingZones.pdf)
- On-site passenger loading requires a vertical clearance of not less than 114 inches and room to maneuver paratransit size vans in and out with turn around. Any planned valet parking requires an accessible passenger loading zone within the parcel.
- Bike racks are not permitted on sidewalk adjacent to passenger loading zones. Relocate bike racks accordingly.
- The project shall come back to SDAT prior to finalizing the project description for environmental review and the sponsor shall submit the project’s loading needs analysis and a loading operations plan regarding both off-street and on-street loading operations. While developing the project description, the sponsor shall work with the project’s environmental/transportation planner and with Paul Kniha (paul.kniha@sfmta.com), SFMTA Color Curb Program Manager, and Karina Lairret (karina.lairret@sfdpw.org), Associate Engineer with the Public Works Disability Access Coordinator, to discuss and revise the project’s loading needs and corresponding accessibility requirements.

<p><b>Follow-up</b></p>	<p>Pre-entitlement/Next SDAT</p> <ul style="list-style-type: none"> <li>• Sponsor to submit written statement to Planning expressing intention to follow-up on this item</li> <li>• Submit the project’s loading needs analysis and a loading operations plan regarding both off-street and on-street loading operations</li> <li>• The project shall come back to SDAT prior to finalizing the project description for environmental review and the sponsor shall submit the project’s loading needs analysis and a loading operations plan regarding both off-street and on-street loading operations.</li> <li>• If it has not happened already, meet with both SFMTA Loading Team &amp; Public Works Accessibility Coordinator to coordinate design of loading zone(s) .</li> </ul> <p>Post-entitlement (Post-Certificate of Occupancy)</p> <ul style="list-style-type: none"> <li>• Sponsor to apply for on-street loading zones from the SFMTA permits from SFMTA <a href="https://www.sfmta.com/online-color-curb-application">https://www.sfmta.com/online-color-curb-application</a>)</li> </ul>
<p><b>Contacts</b></p>	<p>Karina Lairret (<a href="mailto:karina.lairret@sfdpw.org">karina.lairret@sfdpw.org</a>), Associate Engineer with the Public Works Disability Access Coordinator                  Paul Kniha (<a href="mailto:paul.kniha@sfmta.com">paul.kniha@sfmta.com</a>), SFMTA Color Curb Program Manager                  Jennifer McKellar (<a href="mailto:Jennifer.mckellar@sfgov.org">Jennifer.mckellar@sfgov.org</a>), Senior Environmental Planner, SF Planning</p>

**7. Street Trees**

- The project is required to install street trees along all frontages. Please coordinate with SF Public Works Bureau of Urban Forestry for guidance on spacing of tree basins.
- Per SFMTA standards, trees are not allowed within 25 feet of the corner property line on approach, but trees can be placed closer to the intersection on exit, to enhance pedestrian visibility and safety. One tree proposed along 17<sup>th</sup> Street approaching Hampshire should be verified it’s not within 25 feet of the corner property line.

- Trees are generally not permitted at T-intersections with pedestrian mid-block crossings as is present at Mariposa and York. This is due to limited sightlines between pedestrians, bicyclists and vehicles approaching the crosswalk. Please coordinate with SF Public Works Bureau of Urban Forestry for guidance.
- The existing trees along all frontages shall remain unless determined otherwise by SF Public Works Bureau of Urban Forestry (BUF). Any proposed new, removed, or relocated street trees and/or landscaping within the public sidewalk may require a permit from SF Public Works Bureau of Urban Forestry (BUF).

Follow-up	<p>Pre-entitlement/Next SDAT</p> <ul style="list-style-type: none"> <li>• Sponsor to submit written statement to Planning expressing intention to follow-up on this item</li> <li>• Submit plans that differentiate existing trees from new trees</li> <li>• Submit revised plans that address tree placement comments above</li> </ul> <p>Post-entitlement</p> <ul style="list-style-type: none"> <li>• Sponsor to obtain any required permits from Public Works Bureau of Urban Forestry (BUF)</li> </ul>
Contacts	Public Works Bureau of Urban Forestry, <a href="mailto:urbanforestry@sfdpw.org">urbanforestry@sfdpw.org</a> , 628-652-8733

**8. Street Lighting**

- If existing lighting conditions on fronting the project site do not meet City standards, the project will be required to upgrade street lighting and/or pedestrian lighting. To determine if lighting improvements are required, the sponsor will need to provide photometric studies for street lighting plans to the SFPUC.
- Please coordinate with the SFPUC Streetlights Division on this item at [Streetlights@sfwater.org](mailto:Streetlights@sfwater.org). The sponsor shall submit written statement to SDAT expressing intention to follow-up on this item.

**9. Transformer**

- SDAT supports the proposed location of a transformer room. Confirm all location and access requirements with PG&E prior to submitting the final building designs to the Planning Department.

Follow-up	<p>Pre-entitlement/Next SDAT</p> <ul style="list-style-type: none"> <li>• Sponsor to show proposed transformer locations on plans to be submitted and approved by SDAT</li> <li>• Coordinate with SFPUC or PG&amp;E to ensure proposed transformer location meets relevant standards.</li> </ul>
Contacts	<ul style="list-style-type: none"> <li>• Transformer Location: Coordinate with your assigned Current Planner on this item</li> <li>• Transformer Location Technical Feasibility: Coordinate with electrical power utility (SFPUC or PG&amp;E) and Public works BSM.</li> </ul>

**10. Waste Collection**

- Please provide trash loading and removal strategy explaining how trash bins will be moved between the trash storage area and the street on pickup days.
- Provision for trash removal should not be in the public right-of-way as is indicated on the plans. Please update plans to reflect no incursion into the public right-of-way.

- See item #3. City policy prohibits curb cuts the sole purpose of which are used to transfer trash bin to and from the curb. Remove the proposed curb cut for waste collection on Hampshire Street.

Follow-up	Pre-entitlement/Next SDAT <ul style="list-style-type: none"> <li>• Sponsor to submit trash loading and removal strategy to SDAT</li> </ul>
Contacts	Coordinate with Recology to ensure proposed trash strategy is feasible

#### 11. Outswing Doors

- Out-swinging doors on all project frontages shall be recessed from the plane of the exterior wall to prevent pedestrian traveling on the sidewalk from being struck by opening doors.

### ADDITIONAL STREET DESIGN CONSIDERATIONS

#### 12. Related City Projects – Area Plans/Public Realm Plans

- The project is located within the Eastern Neighborhoods Plan (Mission) and the Mission District Streetscape Plan. The project sponsor is encouraged to read both plans and integrate planning work done to date.
  - Eastern Neighborhoods Plan: <https://generalplan.sfplanning.org/Mission.htm>
  - Mission District Streetscape Plan: [https://sfplanning.org/sites/default/files/archives/CDG/docs/missionstreets/MDSP\\_FINAL\\_DRAFT\\_OCT2010.pdf](https://sfplanning.org/sites/default/files/archives/CDG/docs/missionstreets/MDSP_FINAL_DRAFT_OCT2010.pdf)

#### 13. 17<sup>th</sup> Street Bikeway

- SDAT encourages the project to consider a raised cycle track along the 17<sup>th</sup> Street frontage rather than an at-grade facility.

#### 14. Hampshire Street Sidewalk

- 90-degree curb returns cannot be cleaned by Public Works mechanical street sweepers. Please revise curb returns to meet SF Public Works' Standard Plan for Curb Bulbs or confirm plans for street sweeping.

### ADDITIONAL INFORMATION REQUIRED FOR NEXT SDAT REVIEW

- Existing/proposed curb cuts and curb cuts to be removed
- Street names
- Dimensions of existing and proposed sidewalk and curb extensions on plans
- Dimensions of existing and proposed curb cuts on plans
- Dimensions of existing and proposed transit stops
- Site plan with streetscape features (e.g., bulbouts, trees, transit shelters, benches, bike racks)
- Proposed street tree locations
- Adjacent ROW widths
- Locations of existing utility poles and hydrants
- Turn templates for bus yard access
- Curb-to-curb section, including dimensions of tree wells and path of travel
- Proposed transformer vault location
- A written statement clarifying that Standard SDAT Comments have been reviewed

**STANDARD SDAT COMMENTS**

For your next SDAT submittal, please review the “Standard SDAT Comments” which can be found on the SDAT website (<https://sfplanning.org/project/street-design-advisory-team>), and include a written statement clarifying that this task has been completed and that all plans are consistent with guidelines/standards enumerated in the “Standard SDAT Comments”.

## **GEOTECHNICAL BASELINE REPORT SFMTA Potrero Facility Rebuild San Francisco, California**

### **1.0 INTRODUCTION**

This Geotechnical Baseline Report (GBR) has been prepared by Langan CA, Inc. (Langan) for the new San Francisco Municipal Transit Authority (SFMTA) Potrero facility in San Francisco, California. The project site occupies one city block and is bound by 17<sup>th</sup> Street on the north, Hampshire Street on the east, Mariposa Street on the south, and Bryant Street on the west, as shown on Figure 1. The proposed development will be a 7- to 13-story mixed-use structure that will include a new bus maintenance facility and affordable and mixed income housing.

This GBR presents baselines with respect to certain subsurface conditions that are expected to be encountered during construction that may influence the contractor's rate of progress, tooling selection, tool wear, or approach to bidding the project. The GBR establishes a contractual basis for allocation of geotechnical risk during performance of the work; it does not define the single correct interpretation of geotechnical conditions. This baseline report represents the conditions the contractor is to assume for bidding purposes and for which the contractor is responsible for during construction.

This report includes:

- a summary of the geological and geotechnical information obtained for the project;
- interpretation of anticipated ground and groundwater conditions to be encountered, including interpretive geologic and geotechnical subsurface profiles;
- a summary of how these anticipated conditions have influenced the project design and are expected to impact construction;
- discussion of other design and construction considerations that will impact construction.

Interpretation of subsurface information contained in this GBR has included interpolation between widely spaced subsurface exploration points, extrapolations beyond points of exploration, and review of laboratory test data. Soil and rock deposits vary in type, strength, and other important properties between points of exploration. The judgements assume the use of appropriate means, methods, and levels of workmanship. Ultimately, the behavior of the soil and rock deposits present in the surface and subsurface excavations will be influenced by the contractor's means and methods, and levels of workmanship.

This GBR is to be read in conjunction with the following project Geotechnical Design Report (GDR), which is part of the Contract Documents:

- Geotechnical Investigation Report (Draft), SFMTA Potrero Facility Rebuild, San Francisco, California, dated 23 June 2023, by Langan.

Some of the technical concepts, terms, and descriptions in the GBR may not be familiar to bidders. It is highly recommended that bidders engage a California registered geotechnical engineer or engineering geologist who is familiar with all topics of this report, to carefully review and explain this information so that a complete understanding of the information presented in the GBR can be developed prior to submitting a bid.

Certain drawings and figures contained in other documents in the Contract are referenced by the GBR as an aid to bidders in understanding the elements of the work. Such drawings are not reproduced in the GBR, so this GBR shall be reviewed in conjunction with the Drawings and Specifications and all documents in the Contract.

The GBR was performed in general accordance with our scope of services outlined in our add service request dated 15 December 2023.

## 2.0 PROJECT DESCRIPTION

The project site is rectangular with plan dimensions measuring approximately 480 by 410 feet. It is occupied by an existing paved electrified-bus parking area on the western portion of the site and a one- to two-story bus maintenance facility with rooftop parking and below-grade vehicle service pits on the eastern portion, as shown on Figure 2. The existing grade of the surrounding streets generally slopes down towards the southwest, with the high point at the corner of 17<sup>th</sup> Street and Hampshire Street and lowest point at the corner of Mariposa Street and Bryant Street. The current SFMTA facility is generally at the elevation of Mariposa Street to the south at Elevation 53.5 feet<sup>1</sup>, with up to about 22 feet of retained soil and rock at the northeastern corner of the site where existing adjacent street grade is highest.

According to a review of the 50 percent schematic design drawings (IBI Group, 2023), we understand that the current plans are to demolish the existing paved electrified-bus parking area

---

<sup>1</sup> All elevations reference the City & County of San Francisco Vertical Datum of 2013 based on North American Vertical Datum of 1988 (CCSF-VD13); ground surface elevations are based on the ALTA/NSPS Land Title Survey by IBI Group, dated 3 May 2023.

and the bus maintenance facility and replace them with a 7- to 13-story mixed-use structure that will include a new bus maintenance facility and affordable and mixed income housing.

The proposed finished floor elevation of the ground floor is currently Elevation 50 feet, and the maximum building height is anticipated to be 145 feet above the ground floor, excluding penthouses. A description of the proposed development is as follows:

- The footprint of the new bus maintenance facility will be east of gridline B<sup>2</sup>, as shown on Figure 3. The new bus maintenance facility will occupy the lower four levels (designated as Bus Floor), with the Bus Floor level heights ranging from 12 feet to 20.5 feet, with the roof of the bus maintenance facility 70 feet above the ground floor.
- East of gridline B, four- to seven-levels of affordable and mixed income housing units are planned above the new bus maintenance facility. West of gridline B, 13 floors of housing units are planned.
- The western portion of the site will have a one level basement, as shown on Figure 3; the proposed basement extends 20 feet below the ground floor elevation, with the finished floor elevation of the basement at Elevation 30 feet. In addition, a lower-level work area located between gridlines F to G and 8 to 10.5, as shown on Figure 3, is planned below the ground floor on the southeast portion of the site; according to Sheet S3003 of the structural drawings (Nabih Youssef Structural Engineers, 2023), the finished floor of the lower-level work area is 8.5 feet below the ground floor level, corresponding to a finished floor elevation of Elevation 41.5 feet. The remaining footprint of the site will have the ground floor at Elevation 50 feet.

### 3.0 MANMADE FEATURES

Most of the site along the east side is occupied by a 215-foot-wide bus maintenance facility, as shown on Figure 2. It is a double-height, single-story structure, and the floor level of the maintenance facility conforms to the elevations of Mariposa Street. The garage area of the maintenance facility includes below-grade vehicle service pits. There is roof parking on top of the maintenance facility, which is accessed from 17<sup>th</sup> Street. At this time, as-built drawings of the existing maintenance facility were not available for review.

The geotechnical investigation report by SCI (SCI, 1989), indicates the existing maintenance building is supported on spread footings extending to depths of up to six feet bgs. An asphalt and concrete paved electrified bus parking area occupies the remainder of the site. The bus

---

<sup>2</sup> Gridline based on Sheet A1001 titled, "Site Plan" by IBI Group dated 3 May 2023.

parking area includes ancillary facilities such as support poles for the overhead catenary system, guy wires and electrical lines, a bus washing station and trash compactor facility.

According to borings drilled in the electrified-bus parking area, the area is covered by a section of asphalt over concrete that has thicknesses ranging from 10 to 13 inches. Borings drilled in the existing maintenance building show the building's concrete slab is 6 to 14 inches thick. However, an environmental boring drilled recently in the southeast section of the existing maintenance building cored 22 inches through the existing concrete floor slab and did not find the bottom of the slab.

The site is relatively level as a result of being benched into a natural slope. Elevations of the parking area vary from Elevation 54 feet in the northeast corner to Elevation 48 feet in the southwest corner. Street grades along 17<sup>th</sup> Street are relatively flat along the eastern 1/3 of the street with elevations ranging from Elevation 75 to 77 feet; the western 2/3 of the street slope steeply with elevations varying from Elevation 75 to 62 feet at the intersection of 17<sup>th</sup> Street and Bryant Street. Grades along Bryant and Hampshire Street slope down towards Mariposa Street to Elevation 48 and 54 feet, respectively. The site grades generally conform to the street grades along Mariposa Street.

The site is surrounded by reinforced concrete retaining walls up to 23 feet high along Bryant and 17<sup>th</sup> Street and within the maintenance building along the eastern portion of 17<sup>th</sup> Street and along Hampshire Street. The available as-built records of the retaining walls that were included in the Arup/RYCB report (Arup, 2019) are included in Appendix A. According to the available as-built records, the walls are concrete walls supported on shallow foundations. The as-built records indicate that the shallow footings are of varying dimensions and embedment depths. According to the as-built records, the north and west retaining walls are backdrained; however, drawings with the details of the east wall were not available for our review. Detail sections on Drawing DL-9809 (see as-built drawings in Appendix A) shows granular drain material, surrounded by filter fabric, along the back of the existing north and west walls and a six-inch-diameter perforated pipe near the base of the walls; drawings of the east wall were not available for our review. If these walls are to be incorporated into the new building, the functionality of the drainage system shall be confirmed. In addition, new basement walls and associated floor slabs shall have drainage panels and underdrains, respectively to prevent the buildup of hydrostatic pressures. For baseline purposes, the contractor shall expect to use sumps to pump out water collected beneath the basement level and lower-level work area.

#### **4.0 SOURCES OF GEOLOGIC AND GEOTECHNICAL INFORMATION**

Details of the field exploration activities, laboratory testing and geophysical surveys are described in geotechnical investigation report (Langan, 2023).

Subsurface information was provided by the SFMTA's geotechnical engineer for the design-build bids, which consisted of a report titled *San Francisco Public Works, SFMTA Potrero Facility Rebuild, Geotechnical Engineering Report*, dated 11 November 2019 by Arup/RYCG A Joint Venture (Arup/RYCG). The Arup/RYCG's report included subsurface data by Subsurface Consultants Inc. (SCI), Earth Mechanics Consulting Engineers (EMCE) and by Treadwell & Rollo, Inc. (T&R) from borings performed at and in the site vicinity. The locations of previous exploration points are shown on Figures 2 and 3. Boring logs by SCI, ECME and T&R are presented in Appendix A. Arup/RYCG drilled six additional borings and performed in-situ seismic measurements using active and passive surface wave techniques along four seismic lines. The boring logs and laboratory tests from the Arup/RYCG's report, are presented in Appendix B and the geophysical survey is presented in Appendix C.

To further evaluate the subsurface conditions and excavatability of the bedrock at and in the vicinity of the site, Langan performed additional geophysical surveys. The locations of the geophysical surveys are shown on Figure 2. The geophysical survey results and a brief evaluation by Norcal are presented in Appendix D.

Results of the laboratory testing from the Arup/RYCG 2018 investigation are included in Appendix E.

#### **5.0 GEOLOGIC SETTING**

The project is in the northern part of the San Francisco Peninsula, which falls under the Coastal Ranges geomorphic province. This province is characterized by a series of north-northwest trending mountains and valleys. However, because of recent deposition, these ridges are generally not very visible in San Francisco. Only a few outcrops such as Russian Hill, Nob Hill, Telegraph Hill, Twin Peaks, Potrero Hill, Mount Sutro, Mount Davidson, and the Bayview Hills are exposed (Arup, 2018).

On the basis of our review of the map titled *Geologic Map of the City and County of San Francisco* (AEG, 2018, Modified from Blake and others, 2000; Bonilla, 1998, 1971; and Schlocker, 1974), the northeast portion of the site is underlain by bedrock of the Franciscan or Coast Range Ophiolite, specifically of the Hunters Point Serpentinite-Matrix Melange, while the southern and

western portions of the site are underlain by Pleistocene deposits as presented in Figure 4. The bedrock is mapped primarily as Serpentinite, but also includes zones of sheared shale. For baseline purposes, the contractor shall expect the serpentinite to contain naturally occurring asbestos (NOA).

## 6.0 GROUND CHARACTERIZATION

Our conclusions regarding the subsurface conditions described in this section of the report are based on the previously performed borings and laboratory tests and the results of the geophysical surveys performed at the site.

### 6.1 Subsurface Conditions

For engineering analyses, excavations and supporting systems, the soils at the were subdivided into soil Units 1 through 3 and bedrock as Unit 4. Interpretive subsurface profiles have been developed based on the information in the GDR and is provided shown on Figures 5 and 6.

#### Unit 1 - Fill:

Unit 1 consists of fill, consisting of loose to dense silty sand, sand with silt, sand with gravel, clayey gravel, and silty gravel and soft to stiff sandy clay, was encountered beneath the existing pavement section and building slab. With the exception of BH-04, the fill thickness encountered was six feet or less; deeper fill, consisting of loose to medium dense silty gravel, clayey gravel, and silty sand with gravel, and medium stiff to stiff sandy clay was encountered to 11 feet bgs at BH-04, which was reported by Arup/RYCG as fill that is possibly associated with the construction of the maintenance building. Where tested, the fines of the silty sand fill have a plasticity index (PI) of 29 which indicates a high expansion potential.

For baseline purposes, the contractor shall expect the fill to be heterogenous, with loose to dense sand and gravel with varying fines, and soft to stiff clay and silt with high expansion potential. In addition, the contractor shall expect to encounter fill up to 11 feet below the existing ground surface elevation beneath the site and the fill includes man-made debris.

#### Unit 2 – Clay and Sand:

Unit 2 consists of 6 to 9½ foot thick layer of soft to medium stiff sandy clay and loose to medium dense clayey sand and sand with clay and was encountered at the southeast corner of the site (Borings BH-SCI-05, BH-04, and BH-06) beneath the fill. Where tested, the sandy clay layer has PIs ranging between 20 to 22 and is moderately expansive.

For baseline purposes, the contractor shall expect up to 10 feet of loose to medium dense sand with varying fines and soft to medium stiff moderately expansive clays to be encountered beneath the fill at the southeast portion of the site.

**Unit 3 - Colma Formation:** Unit 3 consists of a medium dense to very dense sand with varying amounts of fines, known as the Colma Formation. The unit was encountered at the western and southeastern portions of the site. Where encountered, the sand is approximately 5 to 68 feet thick. The Colma Formation was encountered at depths ranging from approximately two feet (Elevation 51.4 feet) to 12 feet (Elevation 37.4 feet). Where tested, it contained 23 and 43 percent fines (particles passing the No. 200 sieve). The shear wave velocity measured in the Colma Formation is 1,000 to 2,000 feet per second.

For baseline purposes, the contractor shall expect the medium dense to very dense Colma Formation sand with fines content ranging from 20 to 45 percent to be encountered at the western and southeastern portions of the site. The contractor shall expect the top of the unit to be encountered at the elevations shown on the contour plan on Figure 7. The contractor shall expect the thickness of the unit to range from 5 to 70 feet.

**Unit 4 - Bedrock:** Unit 4 consists of bedrock of the Franciscan or Coast Range Ophiolite, specifically of the Hunters Point Serpentinite-Matrix Melange. The bedrock is mapped primarily as Serpentinite, but also includes zones of sheared shale. Serpentinite is expected to contain naturally occurring asbestos (NOA). During the site investigation, shale and serpentinite were both encountered where explored.

For baseline purposes, the contractor shall expect the unit to consist of bedrock of the Franciscan and Coast Range Ophiolite Formations and is soft to hard, weak to moderately strong and highly to completely weathered. The contractor shall assume the serpentinite bedrock contains naturally occurring asbestos (NOA). The contractor shall expect the top of the unit to be encountered at the elevations shown on the contour plan on Figure 8.

**Groundwater:** Groundwater was encountered at the site in two of the borings drilled by Arup/RYCG. In BH-01, groundwater was encountered at depths between 30 and 35 feet bgs, corresponding to Elevation 21.8 feet and Elevation 16.8 feet. Arup/RYCG reported perched groundwater above the bedrock encountered in BH-06 at a depth of approximately 9 feet bgs (Elevation 44.9 feet).

For baseline purposes, the contractor shall expect groundwater to be encountered at Elevation 22 feet or perched eight feet above the bedrock where bedrock is encountered above Elevation 22 feet. The contractor shall expect groundwater to exist in seams and fractures in the bedrock.

## 6.2 Soil Corrosivity

CERCO Analytical, Inc. had performed tests on five soil samples from the site to evaluate corrosion potential to buried metals and concrete for Arup/RYCG. The results of the tests as reported by Arup/RYCG in their geotechnical report are summarized in Table 3.

**TABLE 3**  
**Summary of Corrosivity Test Results**

<b>Test Boring</b>	<b>Sample Depth (feet)</b>	<b>pH</b>	<b>Sulfate (mg/kg)</b>	<b>Min. Resistivity (ohms-cm)</b>	<b>Chloride (mg/kg)</b>
BH-01	7	7.44	28	1,400	N.D.
BH-01	41	7.95	N.D.	7,500	N.D.
BH-02	30	7.67	N.D.	8,400	N.D.
BH-02	48	7.27	60	320	N.D.
BH-03	2.5	8.77	22	1,900	N.D.

Note:

1. N.D. = Not detected

According to the resistivity measurements, the soil samples of the fill tested are classified as "corrosive" to buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron. All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron shall be properly protected against corrosion depending upon the critical nature of the structure. All buried metallic pressure piping such as ductile iron firewater pipelines shall be protected against corrosion.

For more detailed recommendations regarding the corrosion protection of buried metals and concrete, a licensed corrosion consultant shall be retained.

### **6.3 Naturally Occurring Asbestos (NOA)**

Serpentinite bedrock containing NOA in the form of green rock fragments exhibiting chrysotile fibers (based on visual observations) has been encountered in Franciscan Complex bedrock. Chrysotile is a grey to green, soft, fibrous silicate mineral in the serpentine subgroup and is one of the most commonly encountered forms of NOA. Any asbestiform material shall be sampled and analyzed via the California Air Resource Board (CARB) 435 method for asbestos content.

Serpentinite bedrock was encountered at the site and therefore the site will be subject to the CARB Asbestos Airborne Toxic Control Measure (ATCM) for construction, grading, quarrying, and surface mining operations dated July 2001 during redevelopment. The CARB's Asbestos ATCM is enforced locally by the Bay Area Air Quality Management District (BAAQMD) and requires construction projects greater than one acre to prepare a site-specific Asbestos Dust Monitoring Plan (ADMP) for agency approval. The ADMP specifies dust mitigation measures that must be

initiated at the start and maintained throughout the duration of the excavation and grading activity per the ATCM. This shall include the following:

- Construction vehicle speed at the work site must be limited to 15 miles per hour (mph) or less.
- Prior to any ground disturbance, sufficient water must be applied to the area to be disturbed to prevent visible dust emissions from crossing the property line.
- Areas to be graded or excavated must be kept adequately wetted<sup>3</sup> to prevent visible dust emission from crossing the property line.
- Storage piles must be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile.
- Equipment must be washed down before moving from the property onto a paved public road.
- Visible track-out on the paved public road must be cleaned using a wet sweeping or a high-efficiency particulate air (HEPA) filter equipped vacuum device within 24 hours.

The project will be required to install a perimeter dust air monitoring network. This typically includes one upwind and two downwind dust monitors, the collection and analysis of daily samples (three per day at a minimum), and daily reporting of those results to BAAQMD throughout the duration of construction grading<sup>4</sup>. Once prepared, the ADMP will be enforceable at the site until post construction stabilization is complete, which shall include one or all of the following:

- establishment of a vegetative cover;
- placement of at least three inches of non-asbestos-containing material; and/or
- fully encapsulating the site in hardscape (i.e., asphalt, sidewalk, or building foundation).

---

<sup>3</sup> "Adequately Wetted" means sufficiently moistened with water to minimize the release of particulate matter into the ambient air as determined by the test method in ATCM subsection (h) (5).

<sup>4</sup> "Construction grading" means any surface disturbance conducted with powered equipment or any related activity, including, but not limited to, all surface and subsurface cuts and fills, excavation, trenching, stockpiling, bulldozing, and landfills.

## 7.0 CONSTRUCTION CONSIDERATIONS

From a geotechnical standpoint, the proposed project is feasible provided the recommendations presented in the GDR (Langan, 2023) are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical issues for this project include:

- presence of undocumented fill and soft to medium stiff clays and loose to medium dense sands above the Colma Formation (Unit 3) at the southeast portion of the site,
- adequate foundation support,
- shoring for the proposed basement excavations and excavation into bedrock,
- potential presence of naturally occurring asbestos (NOA) in the serpentinite bedrock, and
- potential presence of groundwater perched on the bedrock and in bedrock seams and fractures.

### 7.1 Foundation and Settlement

For baseline purposes, the contractor shall expect bedrock (Unit 4) to be exposed at or just beneath the existing maintenance facility in the northeast portion of the site. The contractor shall expect the remainder of the site to be underlain by fill (Unit 1) over Colma Formation (Unit 3), with the exception of the southeast corner of the site where sand and clay (Unit 2) was encountered above the Colma Formation (Unit 3).

The primary factor influencing the design of the foundation system is the variability in the subsurface conditions across the site at the depths of the proposed foundations for the proposed building. Bedrock (Unit 4) and the Colma Formation (Unit 3) have a relatively high bearing capacity and low compressibility and where bedrock or Colma Formation (Unit 3) sand are encountered at or near the subgrade level, the structure can be supported on spread footing foundations. Where the depth to Colma Formation (Unit 3) or bedrock (Unit 4) renders footings uneconomical, drilled piers taking support in Colma Formation (Unit 3) or bedrock (Unit 4) may be used to support the structure. We expect footings and drilled piers supported in Colma Formation (Unit 3) or bedrock (Unit 4) will settle less than an inch.

For baseline purposes, the contractor shall expect where the finished floor elevation is less than five feet above the top of the Colma Formation (Unit 3) a shallow foundation system will be used. Where finished floor is greater than five feet above the top of the Colma Formation (Unit 3), the contractor shall install a drilled pier; this assumes a maximum practical footing depth of five feet.

The contractor shall anticipate the transition between footings and drilled pier foundations to occur where the top of Colma Formation (Unit 3) is at approximate Elevation 45 feet or deeper (see Figure 6 for the Elevation 45-foot top of Colma Formation (Unit 3) elevation contour line) where the proposed finished floor is at Elevation 50 feet. During initial stages of construction, the contractor shall expect to perform exploratory pits, borings, or piers along the proposed foundation transition line to verify the baseline assumptions.

## **7.2 Groundwater Considerations**

The groundwater elevation is likely influenced by wet and dry seasons and will fluctuate a few feet. For baseline purposes, the contractor shall expect the groundwater will be encountered at Elevation 22 feet or at the top of bedrock (Unit 4) if bedrock is shallower than Elevation 22 feet.

Because the site is currently benched into a bedrock slope and groundwater may be perched on bedrock. During excavation groundwater may be encountered perched on top of bedrock or in fractures and may flow into the excavation. The contractor shall be prepared to control groundwater flowing into excavations by installing a drainage system and localized dewatering. The contractor shall be aware the City and County of San Francisco's permit requirements and fees for disposal of groundwater. Alternatively, an impervious shoring system could be installed in lieu of local dewatering and/or drainage system.

## **7.3 Excavation and Dewatering**

According to the current project drawings (IBI Group, 2023), the proposed basement will have a finished floor elevation of Elevation 30 feet. In addition, a lower-level work area located between gridline F to G and 8 to 10.5, will have a finished floor elevation of Elevation 41.5 feet. Assuming average footing excavations of three feet, we anticipate the bottom of excavation elevations will range from Elevation 27 feet for the basement and Elevation 38.5 feet for the lower-level work area. According to the topographic map of the existing street and site grades, we estimate retaining heights ranging from 21 feet to 44 feet for the proposed basement and 10 feet for the lower-level work area.

It is anticipated that dense to very dense Colma Formation (Unit 3) sand and interbedded shale and serpentinite bedrock (Unit 4) with varying degrees of weathering will be encountered at the bottom of excavations. Although weak bedrock can be excavated with conventional earth-moving equipment, such as loaders and backhoes, capable of breaking the moderately hard bedrock, such as hoe-rams and large excavators will likely be required to remove some bedrock. For baseline purposes, the contractor shall expect to use conventional earth-moving equipment

for the excavation of Units 1, 2 and 3 and expect the need for larger equipment, such as hoe-rams and large excavator, for Unit 4. The seismic refraction reports by GEOVision and Norcal (Appendices C and D) have more information regarding the excavatability of the bedrock and shall be reviewed by excavation contractor prior to bidding on the project.

For baseline purposes, the contractor shall expect heavier equipment, such as hoe-rams and large excavators, will be required to remove any remnants of buried foundations or walls from previous buildings that might have occupied the site, or of the existing facilities that interfere with the proposed development. The contractor shall review as built drawings of the existing foundation system and walls to estimate the volume of concrete and assume that they will need to use heavier equipment to remove them.

When preparing the subgrade for the spread footings, areas of loose or disturbed soil may be encountered in localized areas. If loose areas are encountered, the loose material shall be removed and replaced with either lean or structural concrete.

During excavation, the contractor shall expect groundwater will be perched on top of bedrock or in the fractures. The contractor shall expect the portions of the excavations for the basement and lower-level work area that will be in exposed bedrock will require a system of sumps and collection trenches. The contractor shall be familiar with any permit requirements and fees for the installation of wells and for disposal of the groundwater.

Even with active dewatering, wet, disturbed subgrade soil/rock could be exposed at the bottom of excavations and require stabilization prior to placement of improvements. For baseline purposes, the contractor shall expect that in order to stabilize the subgrade, the wet and disturbed subgrade shall be overexcavated and replaced with a lean concrete rat slab.

For drilled shafts, if more than six inches of water is present during concrete placement, either the water shall be pumped out or the concrete be placed into pier shafts using the tremie method and/or a pumper pipe. Concrete shall be placed from the bottom up in a single operation. The tremie pipe shall be maintained at least five feet below the upper surface of the concrete during casting of the piers. To develop the design skin friction value provided in the geotechnical investigation report (Langan, 2023), concrete used for pier construction shall have a slump between seven and nine inches. As the concrete is placed, casing used to stabilize the hole can be withdrawn. The bottom of the casing shall be maintained at least three feet below the surface of the concrete.

## 7.4 Shoring

Where space permits, excavations shallower than five feet may be vertical; however, for deeper excavations, adjacent improvements shall be retained by temporary shoring during excavation for the basement and construction of the building in accordance with the Occupational Safety and Health Administration (OSHA) standards (29 CFR Part 1926). There are several key considerations in selecting a suitable shoring system. Those we consider to be primary concerns are:

- reuse of existing walls along the perimeter of the site to provide temporary support;
- protection of surrounding improvements including the existing streets and buildings;
- ease of installation;
- proper installation of the shoring system to reduce the potential of ground movement, and
- construction cost.

Currently, the site has retaining walls along the northwest, north and northeast property line. The shoring designer shall consider reusing the existing retaining walls as part of their shoring system if they do not interfere with the proposed improvements and are considered structurally sound.

If the existing walls cannot be used as shoring, there are several methods of providing lateral support for the excavation including sheet piles, soldier piles and lagging and soil nailing. Sheet piles are difficult to install into the dense Colma Formation (Unit 3) sand and bedrock (Unit 4). The presence of cohesionless soil precludes soil nailing the entire excavation. Therefore, considering the depths of the proposed cuts, expected soil conditions and our past experiences, soldier pile and lagging system with tiebacks shall be considered the baseline shoring system for the project by the contractor. The presence of sand and bedrock may cause some difficulty with installation of the soldier piles and tiebacks. However, this system has been successfully used in a number of major projects in the vicinity of this site with similar subsurface conditions.

A soldier-pile-and-lagging system consists of concrete encased steel beams placed in predrilled holes extending below the bottom of the excavation. Wood lagging is placed between the piles as the excavation proceeds. Shoring will require tiebacks or internal bracing for lateral support if a cantilever shoring system is not appropriate for the basement excavation.

The shoring system selected shall be designed by a civil engineer knowledgeable in the specific type of construction. The shoring contractor shall select the shoring system based on the subsurface conditions.

Because of the presence of loose to medium dense sand, steel piles shall not be vibrated into place. Our experience has shown that vibration causes settlement of sand and distress to existing improvements. Steel piles shall be placed in predrilled holes backfilled with concrete. For baseline purposes, the contractor shall expect that drilling of the shafts for the soldier piles will require casing and/or the use of slurry to prevent caving of sand layers. If water is encountered in the shafts or drilling mud is used, concrete shall be placed by tremie method. The contractor shall expect drilling of the holes for the soldier beams in the bedrock will be problematic where hard competent rock is encountered. Because the tiebacks will extend beneath the public streets and adjacent buildings, the contractor shall expect encroachment permits will be required. The contractor shall expect deep utility vaults present beneath sidewalks and streets, which will limit the use of tiebacks or require them to.

Where space allows, temporary slopes may be used. Temporary slopes shall not be steeper than 1.5:1 (horizontal to vertical) for slopes up to 10 feet in height. The contractor shall anticipate where temporary slopes are greater than 10 feet, the temporary slopes shall be analyzed on a case-by-case basis by the geotechnical engineer for factor of safety (FS) of at least 1.3. Vertical cuts can be used where the excavation is less than four feet, but the contractor shall expect soil to slough or not remain vertical where cohesionless soil is encountered. The contractor shall remove soil which sloughs into an excavation.

If there is insufficient space to slope the excavation, then a shoring system shall be used to retain the sides of the excavations. Because the depth of the excavations for the basement on the western portion of the site will be on the order of 20 feet, which will require a retained height of 21 to 44 feet, the contractor shall expect the shoring be tied back or internally braced.

## **7.5 Site Preparation and Earthwork**

For baseline purposes, the contractor shall expect that demolition in areas to be developed shall include removal of existing pavement, utility lines, wells, and underground obstructions, including foundations of existing structures. Any vegetation and organic topsoil shall be stripped in areas to receive new site improvements. Stripped organic soil shall be stockpiled for later use in landscaped areas, if approved by the owner and architect; organic topsoil shall not be used as compacted fill.

For baseline purposes, the contractor shall expect brick, rock, concrete, old foundations, and other building rubble will be encountered in the fill (Unit 1). The fill (Unit 1) is likely contaminated and special handling and disposal may be required; the contractor shall review available environmental reports. The contractor shall expect installation of shoring and foundations and excavation will also be difficult in some areas of the site as a result of the obstructions in the fill. In addition, the contractor shall expect serpentinite bedrock containing naturally occurring asbestos (NOA) will be encounter when excavating for footings, the basement level and lower-level work area. Detailed discussion regarding NOA is presented in Section 6.3 and the monitoring for NOA is presented in Section 8.2.

From a geotechnical standpoint, asphalt and concrete removed from the site may be crushed and reused, provided it is free of organic material and rocks or lumps greater than three inches in greatest dimension. The acceptability of using crushed asphalt at the site shall be verified by the property owner, architect, and environmental consultant. Where crushed asphalt pavement materials are used, particles between 1½ and 3 inches in greatest dimension shall comprise no more than 20 percent of the fill by weight.

Where utilities to be removed extend off site, they shall be capped or plugged with grout at the property line. It may be feasible to abandon utilities in-place, provided they will not impact future utilities or building foundations. If utilities are abandoned in-place, they shall be completely filled with flowable cement grout over their entire length. Existing utility lines encountered during construction shall be addressed on a case-by-case basis. However, for baseline purposes, the contractor shall expect existing utilities within four feet of final grades shall be removed, and the resulting excavation shall be properly backfilled.

Where the proposed improvements are to be supported on drilled piers, it will be necessary to remove any obstructions that will interfere with installation of the drilled piers and construction of the footings, pier caps and grade beams. It may be possible to leave some obstructions in place; however, this shall be determined on a case-by-case basis. Excavations resulting from demolition activities shall be backfilled accordingly.

Loose to medium dense sands or gravels are present in the surficial soils. Heavy equipment is typically required to install drilled piers. This type of equipment can disturb the subgrade and may require that the subgrade be winterized or repaired after installation of the drilled pier elements. The contractor shall expect vertical excavations in sand to not be stable and will need to be formed. If caving of footings, pier caps or grade beams occur, the excavation will need to be cleaned out prior to pouring concrete.

## **8.0 INSTRUMENTATION AND MONITORING**

A monitoring program shall be established to evaluate the effects of the construction on the adjacent improvements. The contractor shall install surveying points to monitor the movement of shoring, adjacent improvements, and settlement of the adjacent ground surface during below-grade construction activities. The shoring system and adjacent improvements shall be monitored for movements throughout the excavation and at least until the ground-level slab is cast. Details regarding the location and frequency of the monitoring is presented in the following subsections.

### **8.1 Ground Movement Monitoring**

The conditions of existing buildings within 100 feet of the site shall be photographed and surveyed prior to the start of construction and monitored periodically during construction. A thorough crack survey of the adjacent buildings, especially those surrounding the proposed excavation shall be performed prior to the start of construction and immediately after its completion.

The purpose of these observations is to provide photographic and/or video documentation representative of general existing conditions, and to identify obvious visual deficiencies. The preconditions observations shall also identify areas requiring specific monitoring during construction. Structural integrity is not addressed in such documentation. This baseline information is often critical in the event of future damage claims resulting from construction activities. The preconstruction conditions documentation shall be used to inform an observational and instrumentation monitoring program that can be used to evaluate the performance of adjacent structures and construction procedures.

To monitor ground movements and shoring movements during the excavation activities, the contractor shall install the instrumentation listed below:

Slope inclinometers: For baseline purposes, the contractor shall install slope inclinometers adjacent to the proposed shoring system. The number of inclinometers will be determined once the location of the temporary shoring system has been finalized. However, for baseline purposes, the contractor shall expect to install two inclinometers behind each shoring wall. The slope inclinometers shall be installed following the installation of the shoring walls and prior to excavation. Langan shall obtain inclinometer readings regularly. Initially, depending upon the speed of excavation, the instrumentation shall be read weekly. The frequency of readings may, in the later stage of construction, be modified as appropriate.

Survey points: Survey points shall be installed on the adjacent streets and improvements that are within 100 feet of the proposed excavation. In addition, survey points shall be installed at the tops of the shoring walls at 20-foot-spacing. These points shall be used to monitor the vertical and horizontal movements of the shoring and these improvements. These points shall be selected with the help of the geotechnical engineer, so they can provide the most value to the project. The survey shall be read regularly, and the results shall be submitted to us in a timely manner for review. For estimating purposes, assume that the survey points will be read as follows:

- prior to any shoring work at the site;
- after installing soldier piles;
- after excavation of each lift;
- after the excavation reaches the planned excavation level;
- every two weeks until the street-level floor slab is constructed.

## **8.2 NOA**

As discussed in Section 6.3, the site will be subject to the CARB Asbestos Airborne Toxic Control Measure (ATCM) for construction, grading, quarrying, and surface mining operations dated July 2001 during redevelopment. Also, the project will be required to install a perimeter dust air monitoring network. Upon completion of construction grading and post-construction stabilization, a written closure request is submitted to BAAQMD, and a final district approved site inspection is completed. Based on the discovery of serpentinite, the subsurface lithology beneath the site, and proposed excavation activities, Langan recommends notifying BAAQMD on the discovery of serpentinite at the site and the preparation of an ADMP for BAAQMD review and approval for regulatory compliance prior to construction.

In addition, Langan recommends that the project team consult with a Certified Industrial Hygienist (CIH) to provide health and safety recommendations for potential worker exposure to NOA per California Occupational Safety and Health Administration (OSHA) requirements. Based on our experience on other NOA construction projects in the San Francisco Bay Area, the health and safety recommendations provided by a CIH shall include the following:

- Update the site-specific Health and Safety Plan (HASP) to address the presence of NOA at the site.
- Perform NOA worker training for each trade performing activities in or disturbing NOA.

In our experience, training must be conducted for each applicable subcontractor and individual employees working in NOA or with potential exposure to NOA.

- Perform a series of negative exposure assessments (i.e., personal air monitoring) for each activity and each subcontractor disturbing NOA (excavation and grading, foundation work, etc.).
- During the initial personal air monitoring, personnel protective equipment (PPE) is typically upgraded to Level C (as determined by the CIH). The CIH will work with the subcontractors to determine which activities require personal air monitoring. This typically needs to be repeated for each subcontractor and each new activity.
- Document acceptable personal air monitoring results below the OSHA permissible exposure limit (PEL) for asbestos and deescalate PPE to Level D (if monitoring results are below the OSHA PEL) For baseline purposes, the contractor shall expect that if monitoring results are elevated above OSHA PELs, the CIH will recommend that Level C PPE remain in place until monitoring results indicated acceptable air quality for workers.

A CIH will be able to provide more details on hazard notification and appropriate Cal OSHA compliance requirements. Langan recommends consulting with a CIH before continuing any work in potential areas containing NOA.

4030	Electrical Work - New Service & Switchboard, Light & Power
4031	Electrical Work - Light & Power for Shop Building
4032	Trolley Service Platform
4033	Trolley Pole Supports and Guy Anchors.

**GENERAL NOTES**

THESE NOTES APPLY TO ALL DRAWINGS AND GOVERN UNLESS OTHERWISE SHOWN OR NOTED.

**DATUM:** All elevations shown on the plans are referred to datum, which is a bench mark marked "B.M." on Drawing 4020 and is located 5'-6" east of the northwest corner of the existing building at York St. The assumed elevation of this B.M. is taken as elevation 64.00.

**CONSTRUCTION JOINTS:** The location and type of all proposed construction joints must be approved by the Engineer prior to starting work. At all construction joints in exterior walls, form keys in face of pair by setting pieces of 2" x 4" x 1'-6" long every 3'-0" on centers along the center of wall in the freshly poured concrete. The 2" x 4" pieces are to be removed after concrete has set.

**REINFORCING STEEL:** Bars shall be kept apart a clear distance of 1 1/2 diameters at splices and shall NOT be tied together unless such tie is authorized by the Engineer. Stagger adjacent laps wherever practicable.

**COVER OF REINFORCING:** The following is the clear distance from face of concrete to reinforcing steel: Walls 1"; Columns and Piers 1" to ties; Beams and Spandrels 1" to stirrups; 6" and 8" thick Slabs 1"; 4" Slabs 3/4"; Top of Parapets 2".

All reinforcing steel shall be rigidly supported away from the forms by means of metal spreaders, and/or tie wires. No wall ties or spreaders shall extend closer than 1" to face of concrete.

**BAR SUPPORTS:** Walls reinforced with steel in each face shall have curtain spreaders at not over 4'-0" on centers each way.

Joists shall have 3" Snap-in type joist bar chairs per span.

Beams and Girders shall have beam chairs at not over 5'-0" on centers.

All slab steel shall be rigidly supported by means of "Snap-in" type low slab chairs and continuous high chairs.

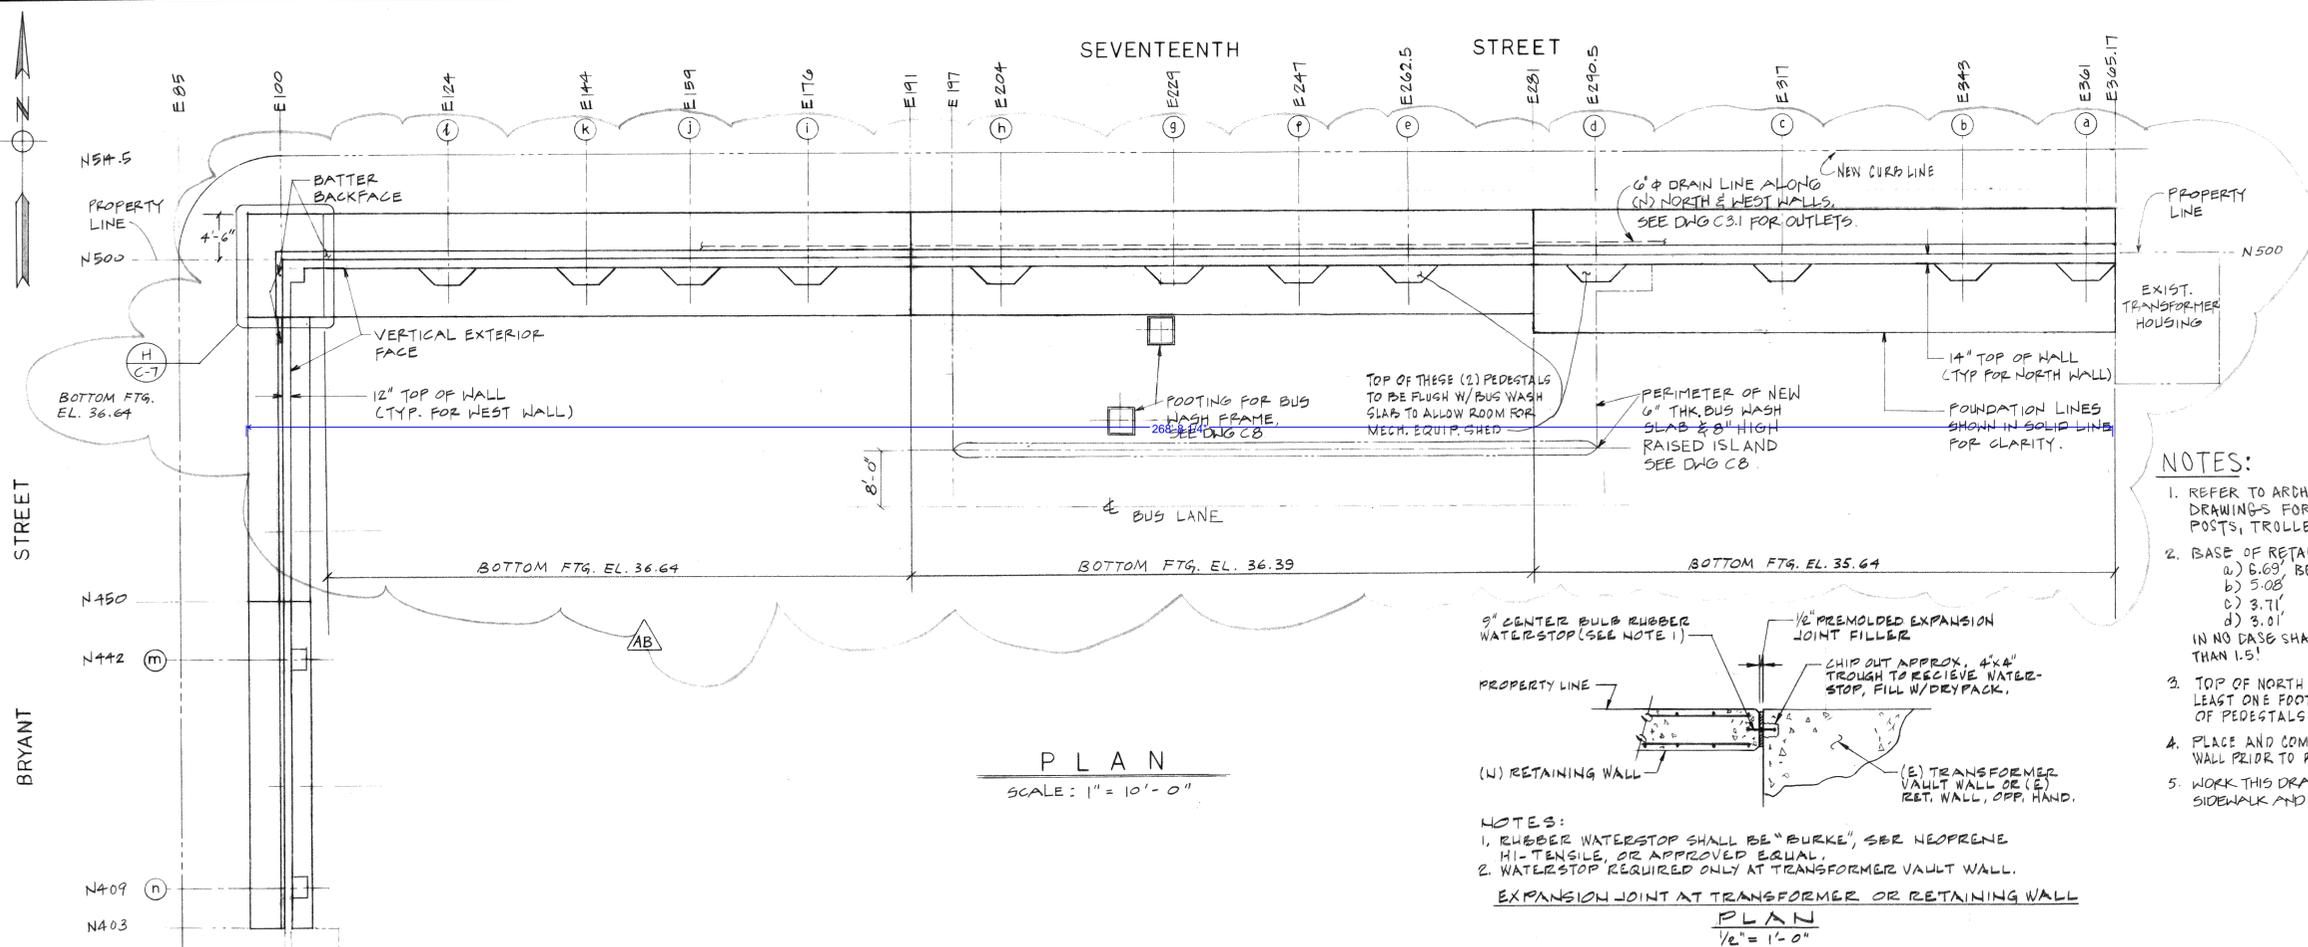

Where mesh in slabs over joists is spliced the laps shall be tied together at 1'-0" intervals along each edge, staggered, thus:

PLATE  
**10**

**BEDDING OF SEDIMENTARY ROCKS**

Very thick-bedded .....	Greater than 4.0	} Bed thickness in feet
Thick-bedded .....	2.0 to 4.0	
Thin-bedded .....	0.2 to 2.0	
Very thin-bedded .....	0.05 to 0.2	
Laminated .....	0.01 to 0.05	
Thinly laminated .....	less than 0.01	

**FRACTURING**

Very little fractured .....	Greater than 4.0	} Size of pieces in feet
Occasionally fractured .....	1.0 to 4.0	
Moderately fractured .....	0.5 to 1.0	
Closely fractured .....	0.1 to 0.5	
Intensely fractured .....	0.05 to 0.1	
Crushed .....	less than 0.05	

**HARDNESS**

- Soft ..... reserved for plastic material alone.
- Low hardness ..... can be gouged deeply or carved easily with a knife blade.
- Moderately hard ..... can be readily scratched by a knife blade; scratch leaves a heavy trace of dust and is readily visible after the powder has been blown away.
- Hard ..... can be scratched with difficulty; scratch produces little powder and is often faintly visible.
- Very hard ..... cannot be scratched with knife blade; leaves a metallic streak.

**STRENGTH**

- Plastic ..... very low strength.
- Friable ..... crumbles easily by rubbing with fingers.
- Weak ..... an unfractured specimen of such material will crumble under light hammer blows.
- Moderately strong ... specimen will withstand a few heavy hammer blows before breaking.
- Strong ..... specimen will withstand a few heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.
- Very strong ..... specimen will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

**WEATHERING**

- Deep ..... moderate to complete mineral decomposition, extensive disintegration, deep and thorough discoloration, many fractures, all extensively coated or filled with oxides, carbonates and/or clay or silt.
- Moderate ..... slight change or partial decomposition of minerals, little disintegration; cementation little to unaffected. Moderate to occasionally intense discoloration. Moderately coated fractures.
- Little ..... no megascopic decomposition of minerals; little or no effect on normal cementation. Slight and intermittent, or localized discoloration. Few stains on fracture surfaces.
- Fresh ..... unaffected by weathering agents. No disintegration or discoloration. Fractures usually less numerous than joints.

480 POTRERO AVENUE  
San Francisco, California

### CLASSIFICATION CHART

**Treadwell & Rollo**

Date 12/08/04

Project No. 4048.01

Figure A-3

**I FRACTURING**

<b>Intensity</b>	<b>Size of Pieces in Feet</b>
Very little fractured	Greater than 4.0
Occasionally fractured	1.0 to 4.0
Moderately fractured	0.5 to 1.0
Closely fractured	0.1 to 0.5
Intensely fractured	0.05 to 0.1
Crushed	Less than 0.05

**II HARDNESS**

1. **Soft** - reserved for plastic material alone.
2. **Low hardness** - can be gouged deeply or carved easily with a knife blade.
3. **Moderately hard** - can be readily scratched by a knife blade; scratch leaves a heavy trace of dust and is readily visible after the powder has been blown away.
4. **Hard** - can be scratched with difficulty; scratch produced a little powder and is often faintly visible.
5. **Very hard** - cannot be scratched with knife blade; leaves a metallic streak.

**III STRENGTH**

1. **Plastic** or very low strength.
2. **Friable** - crumbles easily by rubbing with fingers.
3. **Weak** - an unfractured specimen of such material will crumble under light hammer blows.
4. **Moderately strong** - specimen will withstand a few heavy hammer blows before breaking.
5. **Strong** - specimen will withstand a few heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.
6. **Very strong** - specimen will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

**IV WEATHERING** - The physical and chemical disintegration and decomposition of rocks and minerals by natural processes such as oxidation, reduction, hydration, solution, carbonation, and freezing and thawing.

- D. Deep** - moderate to complete mineral decomposition; extensive disintegration; deep and thorough discoloration; many fractures, all extensively coated or filled with oxides, carbonates and/or clay or silt.
- M. Moderate** - slight change or partial decomposition of minerals; little disintegration; cementation little to unaffected. Moderate to occasionally intense discoloration. Moderately coated fractures.
- L. Little** - no megascopic decomposition of minerals; little or no effect on normal cementation. Slight and intermittent, or localized discoloration. Few stains on fracture surfaces.
- F. Fresh** - unaffected by weathering agents. No disintegration or discoloration. Fractures usually less numerous than joints.

**ADDITIONAL COMMENTS:**

**V CONSOLIDATION OF SEDIMENTARY ROCKS:** usually determined from unweathered samples. Largely dependent on cementation.

- U = unconsolidated
- P = poorly consolidated
- M = moderately consolidated
- W = well consolidated

**VI BEDDING OF SEDIMENTARY ROCKS**

<b>Splitting Property</b>	<b>Thickness</b>	<b>Stratification</b>
Massive	Greater than 4.0 ft.	very thick-bedded
Blocky	2.0 to 4.0 ft.	thick bedded
Slabby	0.2 to 2.0 ft.	thin bedded
Flaggy	0.05 to 0.2 ft.	very thin-bedded
Shaly or platy	0.01 to 0.05 ft.	laminated
Papery	less than 0.01	thinly laminated

## INTRODUCTION

**GEO***Vision* acquired PS Suspension data in one borehole at the Municipal Transportation Agency's Potrero Facility in San Francisco, California. This work was performed for Arup, Inc. Data analysis and report were reviewed by a **GEO***Vision* licensed California professional engineer or geophysicist.

## SCOPE OF WORK

This report presents the results of PS Suspension velocity data collected on March 15<sup>th</sup>, 2018 as detailed in Table 1. The purpose of these measurements was to supplement stratigraphic information obtained during the drilling investigation.

The OYO Suspension PS Logging System (Suspension System) was used to obtain in-situ horizontal shear ( $S_H$ ) and compressional (P) wave velocity measurements in one uncased borehole at 1.3 foot (0.4 m) intervals. Measurements followed **GEO***Vision* Procedure for PS Suspension Seismic Velocity Logging, revision 1.5. Acquired data were analyzed and a profile of velocity versus depth was produced for both  $S_H$  and P waves.

A detailed reference for the suspension PS velocity measurement techniques used in this study is:

Guidelines for Determining Design Basis Ground Motions, Report TR-102293,  
Electric Power Research Institute, Palo Alto, California, November 1993, Sections  
7 and 8.

# INSTRUMENTATION

## Suspension Velocity Instrumentation

Suspension velocity measurements were performed using the suspension PS logging system, manufactured by OYO Corporation, and their subsidiary, RG. This system directly determines the average velocity of a 3.3-foot high segment of the soil column surrounding the boring of interest by measuring the elapsed time between arrivals of a wave propagating upward through the soil column. The receivers that detect the wave, and the source that generates the wave, are moved as a unit in the boring producing relatively constant amplitude signals at all depths.

The suspension system probe consists of a combined reversible polarity solenoid horizontal shear-wave source ( $S_H$ ) and compressional-wave source (P), joined to two biaxial receivers by a flexible isolation cylinder, as shown in Figure 1. The separation of the two receivers is 3.3 feet, allowing average wave velocity in the region between the receivers to be determined by inversion of the wave travel time between the two receivers. The total length of the probe as used in these surveys is approximately 22 feet, with the center point of the receiver pair 12.5 feet above the bottom end of the probe.

The probe receives control signals from, and sends the digitized receiver signals to, instrumentation on the surface via an armored multi-conductor cable. The cable is wound onto the drum of a winch and is used to support the probe. Cable travel is measured to provide probe depth data using a sheave of known circumference fitted with a digital rotary encoder.

The entire probe is suspended in the boring by the cable, therefore, source motion is not coupled directly to the boring walls; rather, the source motion creates a horizontally propagating impulsive pressure wave in the fluid filling the boring and surrounding the source. This pressure wave is converted to P and  $S_H$ -waves in the surrounding soil and rock as it impinges upon the wall of the borehole. These waves propagate through the soil and rock surrounding the borehole, in turn causing a pressure wave to be generated in the fluid surrounding the receivers as the soil waves

pass their location. Separation of the P and S<sub>H</sub>-waves at the receivers is performed using the following steps:

1. Orientation of the horizontal receivers is maintained parallel to the axis of the source, maximizing the amplitude of the recorded S<sub>H</sub> -wave signals.
2. At each depth, S<sub>H</sub>-wave signals are recorded with the source actuated in opposite directions, producing S<sub>H</sub>-wave signals of opposite polarity, providing a characteristic S<sub>H</sub>-wave signature distinct from the P-wave signal.
3. The 6.3 foot separation of source and receiver 1 permits the P-wave signal to pass and damp significantly before the slower S<sub>H</sub>-wave signal arrives at the receiver.
4. In saturated soils, the received P-wave signal is typically of much higher frequency than the received S<sub>H</sub>-wave signal, permitting additional separation of the two signals by low pass filtering.
5. Direct arrival of the original pressure pulse in the fluid is not detected at the receivers because the wavelength of the pressure pulse in fluid is significantly greater than the dimension of the fluid annulus surrounding the probe (feet versus inches scale), preventing significant energy transmission through the fluid medium.

In operation, a distinct, repeatable pattern of impulses is generated at each depth as follows:

1. The source is fired in one direction producing dominantly horizontal shear with some vertical compression, and the signals from the horizontal receivers situated parallel to the axis of motion of the source are recorded.
2. The source is fired again in the opposite direction and the horizontal receiver signals are recorded.
3. The source is fired again and the vertical receiver signals are recorded. The repeated source pattern facilitates the picking of the P and S<sub>H</sub>-wave arrivals; reversal of the source changes the polarity of the S<sub>H</sub>-wave pattern but not the P-wave pattern.

The data from each receiver during each source activation is recorded as a different channel on the recording system. The Suspension PS system has six channels (two simultaneous recording channels), each with a 1024 sample record. The recorded data are displayed as six channels with a common time scale. Data are stored on disk for further processing.

Review of the displayed data on the recorder or computer screen allows the operator to set the gains, filters, delay time, pulse length (energy), and sample rate to optimize the quality of the data before recording. Verification of the calibration of the Suspension PS digital recorder is performed every twelve months using a NIST traceable frequency source and counter, as presented in Appendix B.

## MEASUREMENT PROCEDURES

### Suspension Velocity

One borehole was logged uncased and filled with drilling fluid. Measurements followed the *GEOVision* Procedure for P-S Suspension Seismic Velocity Logging, revision 1.5. Prior to the logging run, the probe was positioned with the top of the probe even with a stationary reference point. The electronic depth counter was set to the distance between the mid-point of the receiver and the top of the probe, minus the height of the stationary reference point, if any, verified with a tape measure, and recorded on the field logs. The probe was lowered to the bottom of the borehole, stopping at 1.3 foot (400 mm) intervals to collect data, as summarized in Table 2.

At each measurement depth the measurement sequence of two opposite horizontal records and one vertical record was performed, and the gains were adjusted as required. The data from each depth were viewed on the computer display, checked, and saved before moving to the next depth.

Upon completion of the measurements, the probe zero depth indication at the depth reference point was verified prior to removal from the boring.

## DATA ANALYSIS

### Suspension Velocity

Using the proprietary OYO program PSLOG.EXE version 1.0, the recorded digital waveforms were analyzed to locate the most prominent first minima, first maxima, or first break on the vertical axis records, indicating the arrival of P-wave energy. The difference in travel time between receiver 1 and receiver 2 (R1-R2) arrivals was used to calculate the P-wave velocity for that 1.0 meter segment of the soil column. When observable, P-wave arrivals on the horizontal axis records were used to verify the velocities determined from the vertical axis data. The time picks were then transferred into a Microsoft Excel<sup>®</sup> template to complete the velocity calculations based on the arrival time picks made in PSLOG.

The P-wave velocity over the 6.3-foot interval from source to receiver 1 (S-R1) was also picked using PSLOG, and calculated and plotted in Microsoft Excel<sup>®</sup>, for quality assurance of the velocity derived from the travel time between receivers. In this analysis, the depth values as recorded were increased by 4.8 feet to correspond to the mid-point of the 6.3-foot S-R1 interval. Travel times were obtained by picking the first break of the P-wave signal at receiver 1 and subtracting 0.35 milliseconds, the calculated and experimentally verified delay from source trigger pulse (beginning of record) to source impact. This delay corresponds to the duration of acceleration of the solenoid before impact.

As with the P-wave records, the recorded digital waveforms were analyzed to locate clear S<sub>H</sub>-wave pulses, as indicated by the presence of opposite polarity pulses on each pair of horizontal records. Ideally, the S<sub>H</sub>-wave signals from the 'normal' and 'reverse' source pulses are very nearly inverted images of each other. Digital Fast Fourier Transform – Inverse Fast Fourier Transform (FFT – IFFT) lowpass filtering was used to remove the higher frequency P-wave signal from the S<sub>H</sub>-wave signal. Different filter cutoffs were used to separate P- and S<sub>H</sub>-waves at different depths, ranging from 600 Hz in the slowest zones to 4000 Hz in the regions of highest velocity. At each depth, the filter frequency was selected to be at least twice the fundamental frequency of the S<sub>H</sub>-wave signal being filtered.

Generally, the first maxima were picked for the 'normal' signals and the first minima for the 'reverse' signals, although other points on the waveform were used if the first pulse was distorted. The absolute arrival time of the 'normal' and 'reverse' signals may vary by +/- 0.2 milliseconds, due to differences in the actuation time of the solenoid source caused by constant mechanical bias in the source or by boring inclination. This variation does not affect the R1-R2 velocity determinations, as the differential time is measured between arrivals of waves created by the same source actuation. The final velocity value is the average of the values obtained from the 'normal' and 'reverse' source actuations.

As with the P-wave data, S<sub>H</sub>-wave velocity calculated from the travel time over the 6.3-foot interval from source to receiver 1 was calculated and plotted for verification of the velocity derived from the travel time between receivers. In this analysis, the depth values were increased by 4.8 feet to correspond to the mid-point of the 6.3-foot S-R1 interval. Travel times were obtained by picking the first break of the S<sub>H</sub>-wave signal at the near receiver and subtracting 0.35 milliseconds, the calculated and experimentally verified delay from the beginning of the record at the source trigger pulse to source impact.

Poisson's Ratio,  $\nu$ , was calculated in the Microsoft Excel<sup>®</sup> template using the following formula:

$$\nu = \frac{\left(\frac{v_s}{v_p}\right)^2 - 0.5}{\left(\frac{v_s}{v_p}\right)^2 - 1.0}$$

Data and analyses were reviewed by a **GEOVision** California professional geophysicist or engineer as a component of the in-house data validation program.

Figure 2 shows an example of R1 - R2 measurements on a sample filtered suspension record. In Figure 2, the time difference over the 3.3 foot interval of 1.88 milliseconds for the horizontal signals is equivalent to an S<sub>H</sub>-wave velocity of 1745 feet/second. Whenever possible, time differences were determined from several phase points on the S<sub>H</sub>-waveform records to verify the data obtained from the first arrival of the S<sub>H</sub>-wave pulse. Figure 3 displays the same record before filtering of the S<sub>H</sub>-waveform record with a 1400 Hz FFT - IFFT digital lowpass filter, illustrating the presence of higher frequency P-wave energy at the beginning of the record, and distortion of the lower frequency S<sub>H</sub>-wave by residual P-wave signal.

## RESULTS

### Suspension Velocity

Suspension R1-R2 P- and S<sub>H</sub>-wave velocities for borehole BH-POT-02 are presented in Figure 4. The suspension velocity data presented in this figure are also presented in Table 3. The Microsoft Excel<sup>®</sup> analysis file is also provided in the data directory that accompanies this report.

P- and S<sub>H</sub>-wave velocity data from R1-R2 analysis and quality assurance analysis of S-R1 data are plotted together in Figure A-1 to aid in visual comparison. It should be noted that R1-R2 data are an average velocity over a 3.3-foot segment of the soil column; S-R1 data are an average over 6.3 feet, creating a significant smoothing relative to the R1-R2 plots. The S-R1 velocity data displayed in these figures are also presented in Table A-1 and are included in the Microsoft Excel<sup>®</sup> analysis file. The Microsoft Excel<sup>®</sup> analysis file also includes Poisson's Ratio calculations, tabulated data and plots.

# SUMMARY

## Discussion of Suspension Velocity Results

Suspension PS velocity data are ideally collected in an uncased, fluid filled boring drilled with rotary mud (rotary wash) methods, as was the case for this project.

Suspension PS velocity data quality is judged based upon 5 criteria.

	<b>Criteria</b>	<b>BH-POT-02</b>
<b>1</b>	Consistent data between receiver to receiver (R1 – R2) and source to receiver (S – R1) data.	Yes.
<b>2</b>	Consistency between data from adjacent depth intervals.	Yes
<b>3</b>	Consistent relationship between P-wave and SH -wave (excluding transition to saturated soils)	Yes Saturation occurs about 45 ft and top of rock is about 66 ft.
<b>4</b>	Clarity of P-wave and SH-wave onset, as well as damping of later oscillations.	This is very good data.
<b>5</b>	Consistency of profile between adjacent borings, if available.	Not Applicable

## **Quality Assurance**

These borehole geophysical measurements were performed using industry-standard or better methods for measurements and analyses. All work was performed under **GEOVision** quality assurance procedures, which include:

- Use of NIST-traceable calibrations, where applicable, for field and laboratory instrumentation
- Use of standard field data logs
- Independent review of calculations and results by a registered professional engineer, geologist, or geophysicist

## **Suspension Velocity Data Reliability**

P- and S<sub>H</sub>-wave velocity measurement using the Suspension Method gives average velocities over a 3.3-foot interval of depth. This high resolution results in the scatter of values shown in the graphs. Individual measurements are very reliable with estimated precision of +/- 5%. Depth indications are very reliable with estimated precision of +/- 0.2 feet. Standardized field procedures and quality assurance checks contribute to the reliability of these data.

## CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision and review of a **GEOVision** California professional geophysicist or engineer.

- \* This geophysical investigation was conducted under the supervision of a California Professional Geophysicist or Engineer using industry standard methods and equipment. A high degree of professionalism was maintained during all aspects of the project from the field investigation and data acquisition, through data processing, interpretation and reporting. All original field data files, field notes and observations, and other pertinent information are maintained in the project files and are available for the client to review for a period of at least one year.

A professional geophysicist's certification of interpreted geophysical conditions comprises a declaration of his/her professional judgment. It does not constitute a warranty or guarantee, expressed or implied, nor does it relieve any other party of its responsibility to abide by contract documents, applicable codes, standards, regulations or ordinances.

Table 1. Boring locations and logging dates

BORING DESIGNATION	DATES LOGGED	LOCATION <sup>(1)</sup>		ELEVATION (FEET)
		LATITUDE	LONGITUDE	
BH-POT-02	3/15/2018			

<sup>(1)</sup> Coordinates not available at time of report

Table 2. Logging dates and depth ranges

BORING NUMBER	TOOL AND RUN NUMBER	DEPTH RANGE (FEET)	CASED OR UNCASED	SAMPLE INTERVAL (FEET)	DATE LOGGED
BH-POT-02	SUSPENSION DOWN01	3.94 – 107.61	UNCASED	1.31	3/15/2018

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for normal distribution corresponds to a coverage probability of approximately 95%. The standard uncertainty of measurement has been determined in accordance with EA's Publication and NIST Technical Note 1297, 1994 Edition. Services rendered comply with ISO/IEC 17025:2005, ANSI/NCSL Z540-1-1994, ANSI/NCSL Z540.3-2006, MPC Quality Manual, MPC CSD and with customer purchase order instructions.

Calibration cycles and resulting due dates were submitted/approved by the customer. Any number of factors may cause an instrument to drift out of tolerance before the next scheduled calibration. Recalibration cycles should be based on frequency of use, environmental conditions and customer's established systematic accuracy. The information on this report, pertains only to the instrument identified.

All standards are traceable to SI through the National Institute of Standards and Technology (NIST) and/or recognized national or international standards laboratories. Services rendered include proper manufacturer's service instruction and are warranted for no less than thirty (30) days. This report may not be reproduced in part or in a whole without the prior written approval of the issuing MPC lab.

# 1 INTRODUCTION

In-situ seismic measurements using active and passive surface wave techniques were performed at the proposed locations of the MTA Potrero Facility, San Francisco, California from March 13<sup>th</sup> to March 16<sup>th</sup>, 2018. The primary purpose of the surface geophysical investigation was to map depth to bedrock beneath four seismic lines designated as Lines 1 through 4. The secondary purpose of the investigation was to provide a shear (S) wave velocity of the bedrock and overlying sediments and estimate the average S-wave velocity of the upper 30 m ( $V_{S30}$ ). The active surface wave technique utilized during this investigation consisted of the multi-channel analysis of surface waves (MASW) method. The passive surface wave techniques consisted of the horizontal over vertical spectral ratio (HVSr), array microtremor, and refraction microtremor methods. Due to a thick surficial layer of asphalt and concrete, it was determined in the field that seismic refraction would not yield reliable results at the site. The geology in the vicinity of the seismic lines was expected to consist of sediments overlaying Franciscan Complex bedrock. The locations of the active and passive surface wave arrays are shown on Figure 1 and in Table 1.

$V_{S30}$  is used in the NEHRP provisions and the Uniform Building Code (UBC) to separate sites into classes for earthquake engineering design (BSSC, 1994). The average shear wave velocity of the upper 100 ft ( $V_{S100ft}$ ) is used in the International Building Code (IBC) for site classification. These site classes are as follows:

- Class A – hard rock –  $V_{S30} > 1500$  m/s (UBC) or  $V_{S100ft} > 5,000$  ft/s (IBC)
- Class B – rock –  $760 < V_{S30} \leq 1500$  m/s (UBC) or  $2,500 < V_{S100ft} \leq 5,000$  ft/s (IBC)
- Class C – very dense soil and soft rock –  $360 < V_{S30} \leq 760$  m/s (UBC)  
or  $1,200 < V_{S100ft} \leq 2,500$  ft/s (IBC)
- Class D – stiff soil –  $180 < V_{S30} \leq 360$  m/s (UBC) or  $600 < V_{S100ft} \leq 1,200$  ft/s (IBC)
- Class E – soft soil –  $V_{S30} < 180$  m/s (UBC) or  $V_{S100ft} < 600$  ft/s (IBC)
- Class F – soils requiring site-specific evaluation

At many sites, active surface wave techniques (MASW) with the utilization of portable energy sources, such as hammers and weight drops, are sufficient to obtain a 30 m (100 ft) S-wave velocity sounding. At sites with high ambient noise levels and/or very soft soils, these energy sources may not be sufficient to image to 30 m and a larger energy source, such as a bulldozer, is necessary. Alternatively, passive surface wave techniques, such as the array microtremor technique or the refraction microtremor method of Louie (2001), can be used to extend the depth of investigation at sites that have adequate ambient noise conditions. It should be noted that two-dimensional passive surface wave arrays (e.g. triangular, circular, or L-shaped arrays) will perform better than linear arrays. However due to the expected high degree of lateral velocity variability and site constraints, two-dimensional passive surface wave arrays were not feasible.

This report contains the results of the active and passive surface wave measurements conducted at the site. An overview of the surface wave methods is given in Section 2. Field and data reduction procedures are discussed in Sections 3 and 4, respectively. Interpretation and results are presented in Section 5 and Section 6 presents our conclusions. References and our professional certification are presented in Sections 7 and 8, respectively.

## 2 OVERVIEW OF THE SURFACE WAVE METHODS

A discussion of active and passive surface wave methods is provided in the technical note included as Appendix A. Active surface wave techniques include the spectral analysis of surface waves (SASW) and multi-channel array surface wave (MASW) methods. Passive surface wave techniques include the array and refraction microtremor methods.

The basis of surface wave methods is the dispersive characteristic of Rayleigh and Love waves when propagating in a layered medium. The Rayleigh wave phase velocity,  $V_R$ , depends primarily on the material properties ( $V_S$ , mass density and Poisson's ratio or compression wave velocity) over a depth of approximately one wavelength. The Love wave phase velocity,  $V_L$ , depends primarily on  $V_S$  and mass density. Rayleigh and Love wave propagation are also affected by damping or seismic quality factor ( $Q$ ).

Waves of different wavelengths,  $\lambda$ , (or frequencies,  $f$ ) sample different depths. As a result of the variance in the shear stiffness of the layers, waves with different wavelengths travel at different phase velocities; hence, dispersion. A surface wave dispersion curve (dispersion curve) is the variation of  $V_R$  or  $V_L$  with  $\lambda$  or  $f$ .

The SASW and MASW methods are in-situ seismic method for determining shear wave velocity ( $V_S$ ) profiles (Stokoe et al., 1994; Stokoe et al., 1989; Park et al., 1999a and 1999b, Foti, 2000). Surface wave techniques are non-invasive and non-destructive, with all testing performed on the ground surface at strain levels in the soil in the elastic range ( $< 0.001\%$ ). SASW testing consists of collecting surface wave phase data in the field, generating the dispersion curve, and then using iterative forward or inverse modeling to calculate the shear stiffness profile. MASW testing consists of collecting multi-channel seismic data in the field, applying a wavefield transform to obtain the dispersion curve, and data modeling.

A detailed description of the SASW field procedure is given in Joh, 1996. A vertical dynamic load is used to generate horizontally-propagating Rayleigh waves and a horizontal force is used to generate Love waves. The ground motions are monitored by two, or more, vertical (Rayleigh wave) or horizontal (Love wave) receivers and recorded by the data acquisition system capable of performing both time and frequency-domain calculations. Theoretical, as well as practical considerations, such as attenuation, necessitate the use of several receiver spacings to generate the dispersion curve over the wavelength range required to evaluate the stiffness profile. To minimize phase shifts due to differences in receiver coupling and subsurface variability, the source location is reversed. To develop a  $V_S$  model to a 30 meter depth using Rayleigh wave methods, energy sources typically include: small hammers (rock hammer or 3 lb hammer) for short receiver intervals; 10 to 20 lb sledgehammers for intermediate separations, and accelerated weight drops (AWD) or an electromechanical shaker for larger spacings. More energetic sources, such as bulldozers or seismic vibrators (Vibroseis<sup>TM</sup>), can be used to conduct characterize velocity structure to depths of 100 m or more. Energy sources for shallow imaging using Love waves include a hammer and horizontal traction plank, portable hammer impact aluminum source, and inclined or horizontal accelerated weight drop systems. Energy sources for deeper imaging using Love waves include horizontal seismic vibrators. Generally, high frequency (short wavelength) surface waves are recorded across receiver pairs spaced at short intervals, whereas low frequency (long wavelength) surface waves require greater spacing between

receivers. Dispersion data averaged across greater distances are often smoother because effects of localized heterogeneities are averaged.

After the time-domain motions from the two receivers are converted to frequency-domain records using the Fast Fourier Transform, the cross power spectrum and coherence are calculated. The phase of the cross power spectrum,  $\phi_w(f)$ , represents the phase differences between the two receivers as the wave train propagates past them. It ranges from  $-\pi$  to  $\pi$  in a wrapped form and must be unwrapped through an interactive process called masking. Phase jumps are specified, near-field data (wavelengths longer than two times the distance from the source to first receiver) and low-coherence data are removed. The experimental dispersion curve is calculated from the unwrapped phase angle and the distance between receivers by:

$$V_{R/L} = f * d_2 / (\Delta\phi / 360^\circ)$$

where  $V_R$  = Rayleigh wave phase velocity  
 $V_L$  = Love wave phase velocity  
 $f$  = frequency  
 $d_2$  = distance between receivers  
 $\Delta\phi$  = the phase difference in degrees

A detailed description of the MASW method is given by Park, 1999a and 1999b. Ground motions are recorded by 24 or more geophones spaced 1 to 3 m apart and aligned in a linear array and connected to a seismograph. Energy sources are the same as those outlined above for SASW testing. When applying the MASW technique to develop a one-dimensional (1-D)  $V_S$  model, the surface-wave data preferably is acquired using multiple-source offsets at both ends of the array. Rayleigh and Love wave MASW acquisition can easily be combined with P- and S-wave seismic refraction acquisition, respectively. A wavefield transform is applied to the time-history data to convert the seismic record from time-offset space to phase velocity-frequency space in which the surface-wave dispersion curve can be easily identified. Common wave-field transforms include the frequency-wavenumber (f-k) transform, slant-stack transform ( $\tau$ -p), frequency domain beamformer, and phase-shift transform.

A detailed discussion of the array microtremor method can be found in Okada, 2003. This technique uses 4, or more receivers aligned in a 2-dimensional array. Triangle, circle, semi-circle, and "L" shaped arrays are commonly used, although any 2-dimensional arrangement of receivers can be used. For investigation of the upper 100 m, receivers typically consist of 1 to 4.5 Hz geophones. The triangle array, which consists of several embedded equilateral triangles, is often used as it provides good results with a relatively small number of geophones. With this array, the outer side of the triangle should be at least equal to the desired depth of investigation. The "L" array is useful at sites located at the corner of perpendicular intersecting streets. Typically 20, or more, 30-second noise records are acquired for analysis. The surface wave dispersion curve is typically estimated from array microtremor data using various f-k methods such as beam-forming (Lacoss, *et al.*, 1969) and maximum-likelihood (Capon, 1969); and the spatial-autocorrelation (SPAC) method, which was originally based on work by Aki, 1957. The SPAC method has since been extended and modified (Ling and Okada, 1993 and Ohori *et al.*, 2002) to permit the use of noncircular arrays, and is now collectively referred to as extended spatial autocorrelation (ESPAC or ESAC).

The refraction microtremor technique (ReMi™), a detailed description of which can be found in Louie, 2001, differs from the more established array microtremor technique in that it uses a linear receiver array rather than a two dimensional array. Unlike the SASW method, which uses an active energy source (i.e. hammer), the microtremor technique records background noise emanating from ocean wave activity, wind noise, traffic, industrial activity, construction, etc. Refraction microtremor field procedures typically consist of laying out a linear array of 24, or more, 4.5 Hz geophones and recording 20, or more, 30 second noise records. These noise records are reduced using the software package SeisOpt® ReMi™ v2.0 by Optim™ Software and Data Services. This package is used to generate and combine the slowness (p) – frequency (f) transform of the noise records. The surface wave dispersion curve is picked at the lower envelope of the surface wave energy identified in the p-f spectrum. It should be noted that other data reduction techniques such as seismic interferometry and extended spatial autocorrelation (ESAC) can also be used to extract surface wave dispersion curves from linear array, passive surface wave data.

The horizontal-to-vertical spectral ratio (H/V spectral ratio or HVSR) technique was first introduced by Nogoshi and Igarashi (1971) and popularized by Nakamura (1989). This technique utilizes single-station recordings of ambient vibrations (microtremor or noise) made with a three-component seismometer. In this method, the ratio of the Fourier amplitude spectra of the horizontal and vertical components is calculated to determine the frequency of the maximum HVSR response (HVSR peak frequency), commonly accepted as an approximation of the fundamental frequency ( $f_0$ ) of the sediment column overlying bedrock. The HVSR peak frequency associated with bedrock is a function of the bedrock depth and S-wave velocity of the sediments overlying bedrock. The theoretical HVSR response can be calculated for an S-wave velocity model using modeling schemes based on surface wave ellipticity, vertically propagating body waves, or diffuse wavefields containing body and surface waves. The HVSR frequency peak can also be estimated using the quarter-wavelength approximation:

$$f_0 = \frac{\bar{V}_S}{4z}$$

where  $f_0$  is the site fundamental frequency and  $\bar{V}_S$  is the average shear-wave velocity of the soil column overlying bedrock at depth  $z$ .

The active and passive surface wave techniques complement one another as outlined below:

- SASW/MASW techniques image the shallow velocity structure which cannot be imaged by the microtremor technique and is needed for an accurate  $V_{S30}/V_{S100ft}$  estimate.
- Microtremor techniques work best in noisy environments where SASW/MASW depth investigation may be limited.
- In a noisy environment the microtremor technique will usually extend the depth of an SASW/MASW sounding.
- The degree of fit in the overlapping portion of the dispersion curves from the two techniques provides a level of confidence in the results.

The dispersion curves generated from the active and passive surface wave soundings are generally combined and modeled using iterative forward and inverse modeling routines. The

final model profile is assumed to represent actual site conditions. Several options exist for the Rayleigh wave forward solution: a formulation that takes into account only fundamental-mode Rayleigh wave motion; one that includes all stress waves and incorporates receiver geometry in an SASW test named the 3-D solution (Roesset et al., 1991); one that computes an effective mode for an MASW test but assumes a plane Rayleigh wave and no body wave effects and a multi-mode solution that models different Rayleigh wave modes. Both fundamental mode and multi-mode forward solutions are available for modeling of Love wave data.

The theoretical model used to interpret the dispersion assumes horizontally layered, laterally invariant, homogeneous-isotropic material. Although these conditions are seldom strictly met at a site, the results of active and/or passive surface wave testing provide a good “global” estimate of the material properties along the array. The results may be more representative of the site than a borehole “point” estimate.

It may not always be possible to develop a coherent, fundamental mode dispersion curve over sufficient frequency range for modeling from MASW or SASW data due to dominant higher modes with the higher modes not clearly identifiable for multi-mode modeling. It may, however, be possible to identify the Rayleigh wave phase velocity of the fundamental mode at 40 m wavelength ( $V_{R40}$ ) in which case  $V_{S30}$  can at least be estimated using the Brown et al., 2000 relationship:

$$V_{S30} = 1.045V_{R40}$$

This relationship was established based on statistical analysis of a large number of surface wave data sets from sites with control by velocities measured in nearby boreholes and has been further tested by Martin and Diehl, 2004, and Albarello and Gargani, 2010.

As with all surface geophysical methods, inversion of surface wave dispersion data does not yield a unique  $V_S$  model and there are multiple possible solutions that may equally well fit the experimental data. Based on our experience at other sites, the shear wave velocity models ( $V_S$  and layer thicknesses) determined by surface wave testing are within 20% of the velocities and layer thicknesses that would be determined by other seismic methods [Brown, 1998]. The average velocity of the upper 30 m or 100 ft, however, is much more accurate, often to better than 5%, because it is not sensitive to the layering in the model.  $V_{S30}$  does not appear to suffer from the non-uniqueness inherent in  $V_S$  models derived from surface wave dispersion curves (Martin et al., 2006, Comina et al., 2011). Therefore,  $V_{S30}$  is more accurately estimated from inversion of surface wave dispersion data than the resulting  $V_S$  models.

### 3 FIELD PROCEDURES

Four (4) profiles were established at the site and designated as Lines 1 through 4. The endpoints of the geophysical profiles were marked in the field and surveyed by **GEOVision** staff using a Trimble ProXRS GPS with OmniStar submeter corrections. All geophone and shot point locations were measured using a 100 meter tape measure. The locations of the geophysical traverses are presented in Figure 1 and tabulated in Table 1. Active surface wave data were acquired using the MASW technique. Passive surface wave data were acquired using the array and refraction microtremor method. HVSR measurements were made near borehole locations and nominally at the center of the surface wave arrays.

A typical MASW field layout is shown in Appendix A. MASW equipment used during this investigation consisted of two Geometrics Geode signal enhancement seismographs, 4.5 Hz vertical geophones, seismic cable, 20 lb sledgehammer, and an aluminum plate. MASW data were acquired along linear arrays of 48 geophones spaced 1.5 to 2.5 m apart. Shot points were located up to 9 m from the end geophone locations, as space was available and at every second geophone interval along the array. The 20 lb sledgehammer was used for the offset source locations and interior source locations. Data from the transient impacts (hammers) were averaged 5 times, or more, to improve the signal-to-noise ratio. Photographs of typical MASW equipment are presented in Appendix A. All seismic records were stored on a laptop computer with file names and acquisition parameters documented on a field log.

The passive surface wave equipment consisted of two Geometrics Geode signal enhancement seismographs, 4.5 Hz vertical geophones, and seismic cables. Passive surface wave data were acquired along linear arrays of 48, 4.5 Hz geophones coincident with the MASW arrays. Ambient noise measurements were made along these arrays for at least 30 minutes at a 2 ms sample rate (60+, 30 second records). All passive surface wave data were stored on a laptop computer for later processing. The field geometry and associated files names were documented in field data acquisition forms.

HVSR data were acquired at a seven locations on site (Figure 1) utilizing either a Nanometrics Trillium Compact 120 second seismometer coupled to a Nanometrics Centaur data acquisition unit (referred to herein as Trillium) and a Micromed Tromino® ENGY (herein referred to as Tromino). Microtremor measurements were made for at least 30 minutes at each measurement location with data recorded at 100 samples per second with the Trillium and 128 samples per second with the Tromino. Microtremor data were stored in the data acquisition system and downloaded as Miniseed or ASCII format files at the end of data acquisition.

## 4 DATA REDUCTION AND MODELING

HVSR data were reduced using the Geopsy Version 2.9.1 software package (<http://www.geopsy.org>) developed by Marc Wathelet, ISTERre, Grenoble, France with the help of many other researchers.

Microtremor data recorded by the Trillium were exported to miniseed format and the Tromino data were exported to an ASCII file using the software package Grilla, provided with the instrument. The data file was then loaded into the Geopsy software package, where data file columns containing the vertical and horizontal (north and east) components and the sample rate were specified. HVSR was typically calculated over a frequency range dependent upon the observed site response and using a time window length of 90 s. Time windows were automatically picked. Fourier amplitude spectra were calculated after applying a 5% cosine taper and smoothed by the Konno and Ohmachi filter with a smoothing coefficient value of 40. The vertical amplitude spectra were divided by the root-mean-square (RMS) of the horizontal amplitude spectra to calculate the HVSR for each time window and the average HVSR. Time windows containing clear transients (nearby foot or vehicular traffic) or yielding poor quality results were then deleted and the computations repeated. The average HVSR peak frequency and standard deviation from all time windows used for analysis were computed and presented along with the standard deviation of the HVSR amplitudes for all time windows.

The 2D MASW data were reduced using the software Seisimager/SW developed by Geometrics, Inc. and Seismic Pro Surface V8 developed by Geogiga using the following steps:

- Input all seismic records collected along a profile and geometry into Seisimager.
- Calculate cross correlation of all pairs of receivers over a multiple user-defined offset ranges and sort by the midpoint of the receiver a pair.
- Combine cross correlations gathers with different receiver spacings, specific offset range, and a common midpoint at 15 or 16 m (~50 ft) intervals along each profile, outputting the data file.
- Input common midpoint cross correlation gather seismic records into Seismic Pro Surface software.
- Apply wavefield transform to seismic record to convert the data from time – offset to phase velocity – frequency space.
- Identify and pick Rayleigh wave dispersion curve.
- Repeat for all shot records.
- Apply near-field criteria (maximum wavelength equal 1 to 1.3 times the source to midpoint of receiver array distance).
- Merge multiple dispersion curves associated with the same receiver midpoint (i.e. position along the profile at 15 or 16 m (~50 ft) intervals) but different offset ranges used for the cross correlation gathers, as necessary.

Array and refraction microtremor data were extracted along 30 m intervals of the seismic lines which were approximately centered at the midpoint of the MASW cross correlation gathers. The array microtremor data were reduced using the software Seisimager SW developed by Oyo Corporation/Geometrics, Inc. and the following steps:

- Input all seismic records for a dataset into software.
- Load geometry (x and y positions) for each channel in seismic records.
- Calculate the SPAC coefficients for each seismic record and average.
- For each frequency calculate the RMS error between the SPAC coefficients and a Bessel function of the first kind and order zero over a user defined phase velocity range and velocity step.
- Plot an image of RMS error as a function for frequency (f) and phase velocity (v).
- Identify and pick the dispersion curve as the continuous trend on the f-v image with the lowest RMS error.
- Convert dispersion curves to appropriate format for modeling.
- Combine multiple passive dispersion curves, as appropriate.
- Calculate a representative dispersion curve for the passive dispersion data using a moving average polynomial curve fitting routine.

The refraction microtremor data were reduced using the Optim™ Software and Data Services SeisOpt® ReMi™ v5.0 data analysis package. Data reduction steps included the following:

- Conversion of SEG-2 format field files to SEG-Y format.
- Data preprocessing which includes trace-equalization gaining and DC offset removal.
- Erasing receiver geometry present in the file header.
- Computing the velocity spectrum of each record by p-f transformation.
- Combining the individual p-f transforms into one image.
- Picking and saving the velocity spectrum image.
- Reformat dispersion data to input format for modeling software.

The Rayleigh wave dispersion curves from various coincident data sets were combined (all MASW and passive dispersion data for a 1D sounding or all data with the midpoint of the receiver array over a user defined position range along a profile) to form a composite dispersion curve. Composite dispersion curves were generated at 15 m intervals along Lines 1, 3, and 4, and at 16 m intervals along Line 2. A total of 20 composite dispersion curves were developed for modeling along the profiles. A representative dispersion curve was calculated for each composite dispersion curve using the moving average polynomial curve fitting routine in the software package WinSASW V3.

An iterative forward and inverse modeling process was used to generate an S-wave velocity model for each representative dispersion curve. During this process an initial velocity model was generated based on general characteristics of the dispersion curve. The dispersion curve for this model was then calculated and compared to the observed dispersion curves. Adjustments were then made to the model parameters (layer thickness and  $V_S$ ) manually (forward modeling) and automatically (inverse modeling) until an acceptable agreement with the observed data was obtained. Rayleigh wave dispersion data were modeled using the fundamental and effective mode forward and inverse modeling routine in the WinSASW V3 software package.

Data inputs into the Rayleigh wave modeling software include layer thickness, S-wave velocity, P-wave velocity, and mass density. Because the primary purpose of this investigation was to

develop 2D images of velocity structure along several profiles, models had about twice the number of layers typically used for modeling.

P-wave velocity and mass density only have a very small influence (i.e. less than 10%) on the S-wave velocity model generated from a surface wave dispersion curve. However, realistic assumptions for P-wave velocity, which is significantly impacted by the location of the saturated zone, and mass density will slightly improve the accuracy of the S-wave velocity model.

Constant mass density values of 1.9 to 2.2 g/cm<sup>3</sup> were used in the profile for subsurface soils/rock depending on P- and S-wave velocity. Within the normal range encountered in geotechnical engineering, variation in mass density has a negligible ( $\pm 2\%$ ) affect on the estimated  $V_S$  from surface wave dispersion data. During modeling of Rayleigh wave dispersion data, the compression wave velocity,  $V_P$ , for unsaturated sediments was estimated using a Poisson's ratio,  $\nu$ , of 0.3 and the relationship:

$$V_P = V_S [(2(1-\nu))/(1-2\nu)]^{0.5}$$

Poisson's ratio has a larger affect than density on the estimated  $V_S$  from Rayleigh wave dispersion data. Achenbach (1973) provides approximate relationship between Rayleigh wave velocity ( $V_R$ ),  $V_S$  and  $\nu$ :

$$V_R = V_S [(0.862 + 1.14 \nu)/(1 + \nu)]$$

Using this relationship, it can be shown that  $V_S$  derived from  $V_R$  only varies by about 10% over possible 0 to 0.5 range for Poisson's ratio where:

$$\begin{aligned} V_S &= 1.16V_R \text{ for } \nu = 0 \\ V_S &= 1.05V_R \text{ for } \nu = 0.5 \end{aligned}$$

The realistic range of the Poisson's ratio for typical unsaturated sediments is about 0.25 to 0.35. Over this range,  $V_S$  derived from modeling of Rayleigh wave dispersion data will vary by about 5%. An intermediate Poisson's ratio of 0.3 was selected for modeling to minimize any error associated with the assumed Poisson's ratio.

To reduce errors associated with expected high Poisson's ratio of saturated sediments, the saturated zone was anchored at an assumed depth of about 33 ft, based on borehole data provided by Arup, Inc., when modeling the surface wave dispersion data. Poisson's ratio of the saturated zone was set to about 0.46 depending on the modeled S-wave velocity (e.g. higher velocity sediments expected to have a lower Poisson's ratio in the saturated zone).

## 5 INTERPRETATION AND RESULTS

S-wave velocity models were developed at nominal 50 ft intervals along each profile. A sample of the developed 1D S-wave velocity model is presented as Figure 2. The velocity models were combined and color enhanced contour maps developed to present the S-wave velocity structure beneath each profile. S-wave velocity models for Lines 1 to 4 are presented in Figures 3, 4, 5, and 6, respectively.

The Rayleigh wave phase velocities from the shallower MASW and deeper passive surface wave measurements were generally found to be in good agreement in the region of overlapping wavelengths as shown on Figure 2. The velocity models developed for each representative dispersion curve reflect the average velocity structure beneath the arrays. For MASW and passive surface wave data collected along Lines 1 to 4, the velocity models generally reflect the average velocity structure beneath approximate 100 ft segments of the profiles centered on the measurement locations, which was necessary to achieve the desired depth of investigation. It should be noted that the  $V_S$  models only shown to approximately 50 ft from the end locations of the seismic lines. Depth of investigation of the models is about 100 ft.

The S-wave velocity of the Franciscan complex is not well constrained by the surface wave  $V_S$  models. The PS Suspension log from **GEOVision** Report 18113-01 indicates that the velocity of the Franciscan complex may be highly variable and contain velocity inversions (higher velocity material overlying lower velocity material) at this site. Surface wave techniques cannot resolve such structures at depth and, therefore, velocities are likely more representative of the rocks average velocity structure. The resolution decreases gradually with depth due to the loss of sensitivity of the dispersion curve to changes in  $V_S$  at greater depth. The surface wave  $V_S$  models should only be used to determine the approximate depth Franciscan complex. The surface wave phase velocity data was degraded in the northwestern portion of the site where bedrock is shallowest due to probable higher modes influence on the surface wave phase velocity data.

In general, the subsurface velocity structure consists of the surficial layer of sediments with a S-wave velocity of about 1,200 ft/s or less. Followed by a thicker zone of sediments with a S-wave velocity ranging from greater than 1,200 ft/s to 1,800 ft/s. The top of Franciscan complex bedrock corresponds with the 2,000 to 2,200 ft/s velocity contours and have been interpreted to approximately track the 2,000 ft/s contour shown on S-wave velocity models for discussion purposes. The contact of the sediments and Franciscan generally deepens to the south and west along the  $V_S$  profiles.

The  $V_S$  model for Line 1 is presented as Figure 3. Seismic velocity increases to 2,000 ft/s at a depth of about 38 ft beneath western end of the model, about 22 ft beneath the central portion of the model, and 19 ft beneath the eastern portion of the model. The average S-wave velocity of the upper 30 m ( $V_{S30}$ ) ranges from about 566 at the western portion to 743 ft/s at the eastern portion of the model.

The  $V_S$  model for Line 2 is presented as Figure 4. Seismic velocity increases to 2,000 ft/s at a depth of about 40 ft beneath southern end of the model, about 30 ft beneath the central portion of the model, and 18 ft beneath the northern end of the model. The average S-wave velocity of the

upper 30 m ranges from about 567 at the southern portion of the model to 705 ft/s at the northern portion of the model.

The  $V_S$  model for Line 3 is presented as Figure 5. Seismic velocity increases to 2,000 ft/s at a depth of about 65 ft beneath western end of the model, about 56 ft beneath the central portion of the model, and 47 ft beneath the eastern end of the model. The average S-wave velocity of the upper 30 m ranges from about 479 at the western portion of the model to 516 ft/s at the eastern portion of the model.

The  $V_S$  model for Line 4 is presented as Figure 6. Seismic velocity increases to 2,000 ft/s at a depth of about 69 ft beneath southern end of the model, about 57 ft beneath the central portion of the model, and 48 ft beneath the northern end of the model. The average S-wave velocity of the upper 30 m ranges from about 478 at the southern portion of the model to 552 ft/s at the northern portion of the model.

The observed HVSR data for locations HV1 to HV7 are presented in Figures 7 and 8. The HVSR data collected at the seven locations are very similar, indicating that even the more subtle features likely have geologic origin. The dominant feature in the HVSR data is a high amplitude peak at a frequency of ranging from about 1.8 to 2.1 Hz, which is likely associated with an S-wave velocity structure at a greater depth than the sediment and Franciscan complex contact. However, the HVSR peak frequency is an approximation of the fundamental site frequency and is likely related to Franciscan becoming competent bedrock. Additionally, there is subtle, lower amplitude, high frequency HVSR peak at a frequency of range of about 10 to 12 Hz observed at HV4, HV5, and HV7. This peak may be related to the increase in S-wave velocity associated with the top of shallow Franciscan complex along this portion of the site.

## 6 CONCLUSIONS

Active and passive surface wave measurements were performed at the proposed locations of the MTA Potrero Facility, San Francisco, California. The primary purpose of the surface geophysical investigation was to map depth to bedrock beneath four seismic lines designated as Lines 1 through 4. The secondary purpose of the investigation was to provide a shear (S) wave velocity of the bedrock and overlying sediments and estimate the average S-wave velocity of the upper 30 m ( $V_{S30}$ ). The active surface wave technique utilized during this investigation consisted of the multi-channel analysis of surface waves (MASW) method. The passive surface wave techniques consisted of the horizontal over vertical spectral ratio (HVSR), array microtremor, and refraction microtremor methods. The locations of the geophysical testing arrays are presented in Figure 1 and Table 1.

Color enhanced contour maps were developed to present the S-wave velocity structure beneath each profile. S-wave velocity models for Lines 1 to 4 are presented in Figures 3, 4, 5, and 6, respectively. The top of Franciscan complex bedrock is interpreted to approximately correspond to the 2,000 to 2,200 ft/s velocity contours shown on S-wave velocity models. The contact of the sediments and Franciscan generally deepens to the south and west along the  $V_S$  profiles. The velocities of the Franciscan complex may be highly variable and contain velocity inversions at this site. Therefore, velocities of the Franciscan derived from the surface wave techniques likely are more representative of the average rock velocities. Depth of investigation of the models is about 100 ft.

Observed HVSR data are presented as Figures 7 and 8. The dominant feature in the HVSR data is a high amplitude peak at a frequency of ranging from about 1.8 to 2.1 Hz, which is likely associated with an S-wave velocity structure at a greater depth than the sediment and Franciscan complex contact. However, the HVSR peak frequency is related to the fundamental site frequency which is likely related to Franciscan becoming competent bedrock at depth beneath the site.

The average S-wave velocity of the upper 30 m ( $V_{S30}$ ) ranges from about 478 to 743 ft/s. Therefore, according to the Uniform and International Building Codes, the area in the vicinity of the surface wave arrays is classified as Class C, very dense soil and soft rock.

## 8 CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision of and reviewed by a **GEOVision** California Professional Geophysicist.

Prepared by

---

David Carpenter  
California Professional Geophysicist, P.Gp. 1088  
**GEOVision** Geophysical Services

5/2/2018

Date

- \* This geophysical investigation was conducted under the supervision of a California Professional Geophysicist using industry standard methods and equipment. A high degree of professionalism was maintained during all aspects of the project from the field investigation and data acquisition, through data processing interpretation and reporting. All original field data files, field notes and observations, and other pertinent information are maintained in the project files and are available for the client to review for a period of at least one year.

A professional geophysicist's certification of interpreted geophysical conditions comprises a declaration of his/her professional judgment. It does not constitute a warranty or guarantee, expressed or implied, nor does it relieve any other party of its responsibility to abide by contract documents, applicable codes, standards, regulations or ordinances.

## **APPENDIX A**

# ACTIVE AND PASSIVE SURFACE WAVE TECHNIQUES

## Overview

Active and passive surface wave techniques are relatively new in-situ seismic methods for determining shear wave velocity ( $V_s$ ) profiles. Testing is performed on the ground surface, allowing for less costly measurements than with traditional borehole methods. The basis of surface wave techniques is the dispersive characteristic of Rayleigh waves when traveling through a layered medium. Rayleigh wave velocity is determined by the material properties (primarily shear wave velocity, but also to a lesser degree compression wave velocity and material density) of the subsurface to a depth of approximately 1 to 2 wavelengths. As shown in the adjacent diagram, longer wavelengths penetrate deeper and their velocity is affected by the material properties at greater depth. Surface wave testing consists of measuring the surface wave dispersion curve at a site and modeling it to obtain the corresponding shear wave velocity profile.

## Active Surface Wave Techniques

Active surface wave techniques measure surface waves generated by dynamic sources such as hammers, weight drops, electromechanical shakers, vibroseis and bulldozers. These techniques include the spectral analysis of surface waves (SASW) and multi-channel array surface wave (MASW) methods.

**Hammer Energy Sources**

**Accelerated Weight Drop**

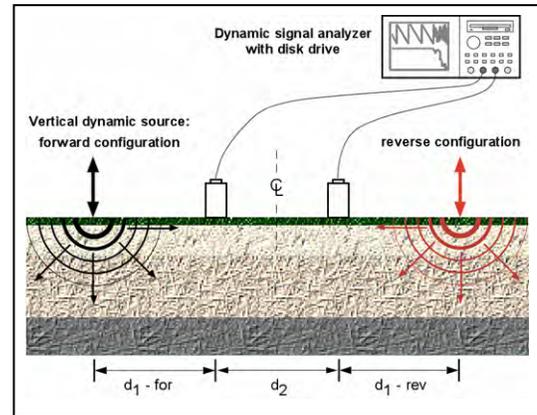

**Electromechanical Shaker**

**Bulldozer Energy Source**

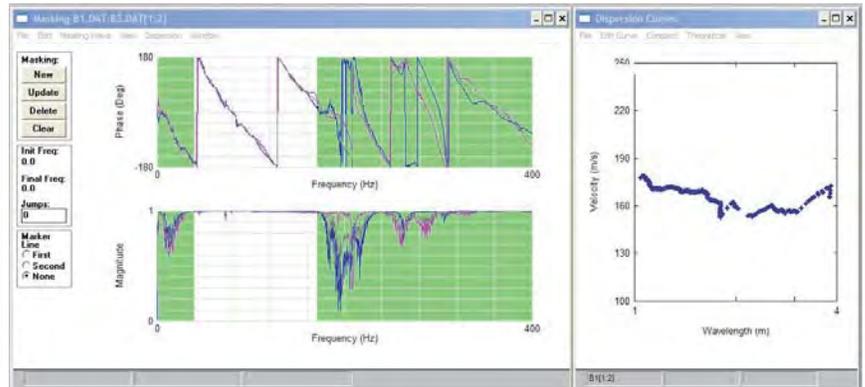

The SASW method is optimized for conducting  $V_S$  depth soundings. A dynamic source is used to generate surface waves of different wavelengths (or frequencies) which are monitored by two or more receivers at known offsets. An expanding receiver spread and optimized source-receiver geometry are used to minimize near field effects, body wave signal and attenuation. A dynamic signal analyzer is typically used to calculate the phase and coherence of the cross spectrum of the time history data collected at a pair of receivers. During data analysis, an interactive masking process is used to discard low quality data and to unwrap the phase spectrum, as shown in the figure below. The dispersion curve (Rayleigh wave phase velocity versus frequency or alternatively wavelength) is calculated from the unwrapped phase spectrum.

**SASW Setup**

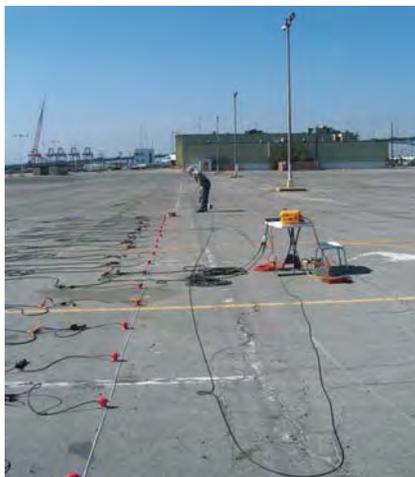

**HP Dynamic Signal Analyzer**

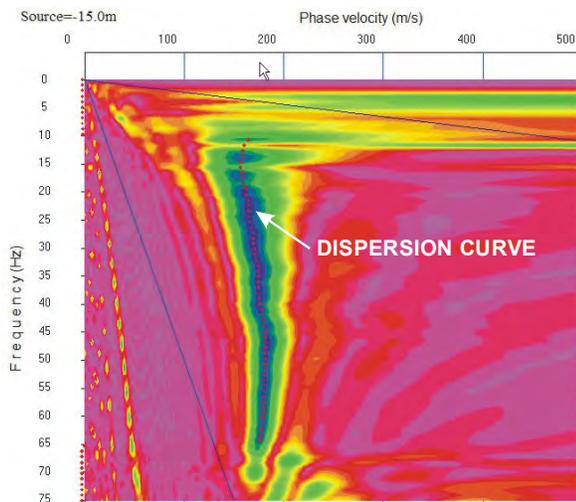

**Masking of Wrapped Phase Spectrum and Resulting Dispersion Curve**

The MASW field layout is similar to that of the seismic refraction technique. Twenty four, or more, geophones are laid out in a linear array with 1 to 2m spacing and connected to a multi-channel seismograph as shown below. This technique is ideally suited to 2D  $V_S$  imaging, with data collected in a roll-along manner similar to that of the seismic reflection technique. The source is offset at a predetermined distance from the near geophone usually determined by field testing. The Rayleigh wave dispersion curve is obtained by a wavefield transformation of the seismic record such as the f-k or  $\tau$ -p transforms. These transforms are very effective at isolating surface wave energy from that of body waves. The dispersion curve is picked as the peak of the surface wave energy in slowness (or velocity) – frequency space as shown. One advantage of the MASW technique is that the wavefield transformation may not only identify the fundamental mode but also higher modes of surface waves. At some sites, particularly those with large velocity inversions, higher surface wave modes may contain more energy than the fundamental mode.

**MASW Field Setup**

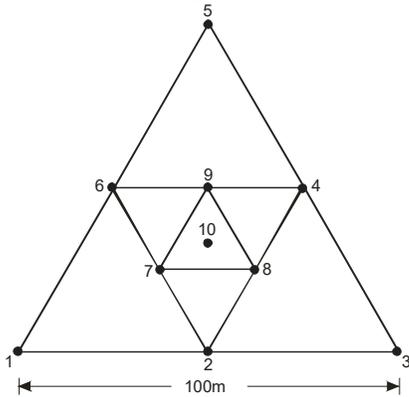

**Wavefield Transform of MASW data**

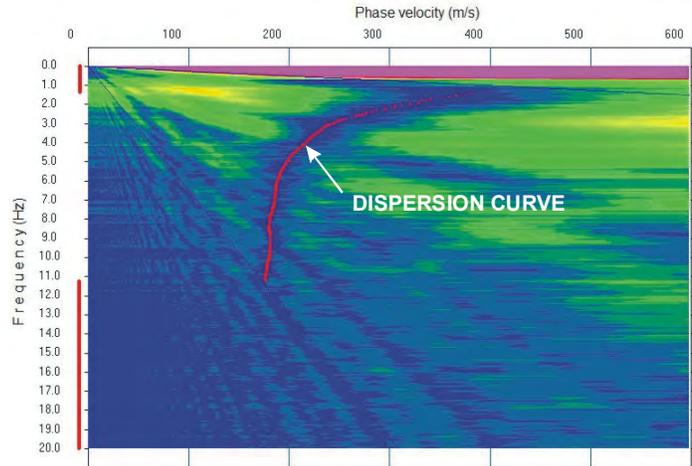

**Passive Surface Wave Techniques**

Passive surface wave techniques measure noise; surface waves from ocean wave activity, traffic, factories, etc. These techniques include the array microtremor and refraction microtremor (REMI) techniques.

The array microtremor technique typically uses 7 or more 4.5- or 1-Hz geophones arranged in a two-dimensional array. The most common arrays are the triangle, circle, semi-circle and "L" arrays. The triangle array, which consists of several embedded equilateral triangles, is often used as it provides good results with a relatively small number of geophones. With this array the outer side of the triangle should be at least as long as the desired depth of investigation. Typically, fifteen to twenty 30-second noise records are acquired for analysis. The spatial autocorrelation (SPAC) technique is one of several methods that can be used to estimate the Rayleigh wave dispersion curve. A first order Bessel function is fit to the SPAC function to determine the phase velocity for particular frequency. The image shown below shows the degree of fitness of the Bessel function to the SPAC function for a wide range of phase velocity and frequency. The dispersion curve, is the peak (best fit), as shown in the figure below.

**Triangle Array Geometry**

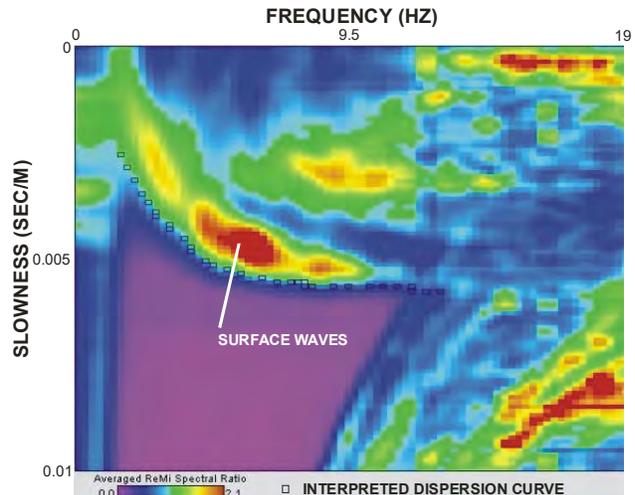

**Dispersion Curve from Array Microtremor Measurements**

The refraction microtremor (REMI) technique uses a field layout similar to the seismic refraction method (hence its name). Twenty-four, 4.5 Hz geophones are laid out in a linear array with a spacing of 6 to 8m and fifteen to twenty 30-second noise records are acquired. A slowness-frequency (p-f) wavefield transform is used to separate Rayleigh wave energy from that of other waves. Because the noise field can originate from any direction, the wavefield transform is conducted for multiple vectors through the geophone array, all of which are summed. The dispersion curve is defined as the lower envelope of the Rayleigh wave energy in p-f space. Because the lower envelope is picked rather than the energy peak (energy traveling along the profile is slower than that approaching from an angle), this technique may be somewhat more subjective than the others, particularly at low frequencies. The SPAC technique can also be used to extract the surface wave dispersion curve from linear array microtremor data providing there are omni-directional noise sources.

**Refraction Microtremor Array Layout**

**Wavefield Transform of REMI Data**

### **Depth of Investigation**

Active surface wave investigations typically use various sized sledge hammers to image the shear wave velocity structure to depths of up to 15m. Weight drops and electromechanical shakers can often be used to image to depths of 30m. Bulldozers and vibroseis trucks can be used to image to depths as great as 100m. Passive surface wave techniques can often image shear wave velocity structure to depths of over 100m, given sufficient noise sources and space for the receiver array. Large passive arrays, utilizing long-period seismometers with GPS clocks have been used to image shear wave velocity structure to depths of several kilometers.

### **Combined Active and Passive Surface Wave Testing**

The combined use of active and passive techniques may offer significant advantages on many investigations. It can be very costly to mobilize large energy sources for 30m/100ft active surface wave soundings. In urban environments, the combined use of active and passive surface wave techniques can image to these depths without the need for large energy sources. We have found that dispersion curves from active and passive surface wave techniques are generally in good agreement, making the combined use of the two techniques viable. It is not recommended that passive surface wave techniques be applied alone for UBC/IBC site classification investigations. Microtremor techniques do not generally characterize near surface velocity, which may have a significant impact of the average shear wave velocity of the upper 30m or 100ft and so should always be used in conjunction with SASW or MASW. An SASW sounding to a depth of 30m requires at least a 60m linear array. If sufficient space is not available for this, it may be possible to use a 45m triangle array on the site or place a 100-200m long REMI array along an adjacent sidewalk or an "L" array at an adjacent street intersection.

**Microtremor Measurements along Sidewalk**

### **Modeling**

There are several options for interpreting surface wave dispersion curves, depending on the accuracy required in the shear wave velocity profile. A simple empirical analysis can be done to estimate the average shear wave velocity profile. For greater accuracy, forward modeling of fundamental-mode Rayleigh wave dispersion as well as full stress wave propagation can be performed using several software packages. A formal inversion scheme may also be used. With many of the analytical approaches, background information on the site can be incorporated into the model and the resolution of the final profile may be quantified.

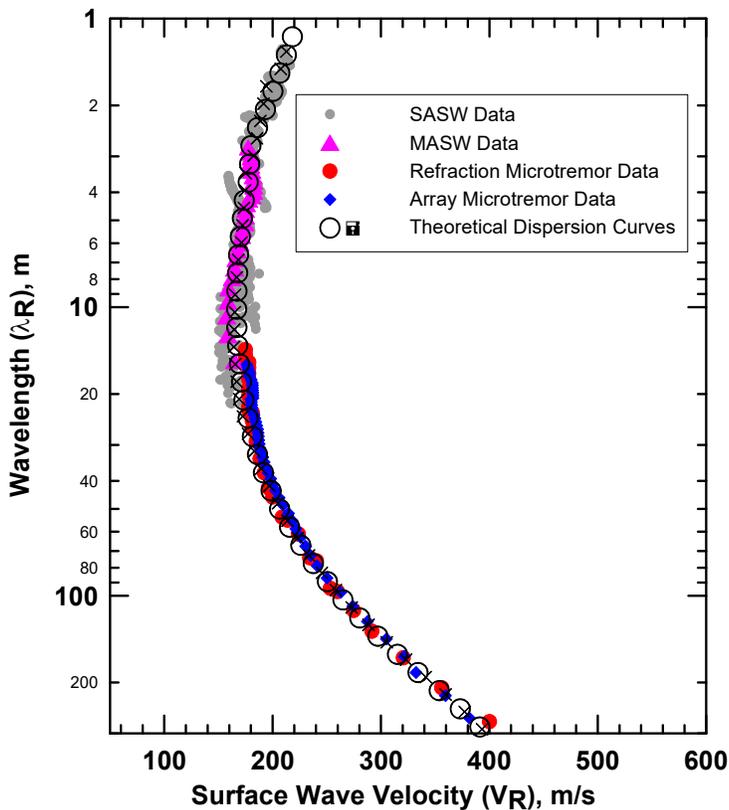

### **Applications**

Active and passive surface wave testing can be used to obtain  $V_s$  profiles for:

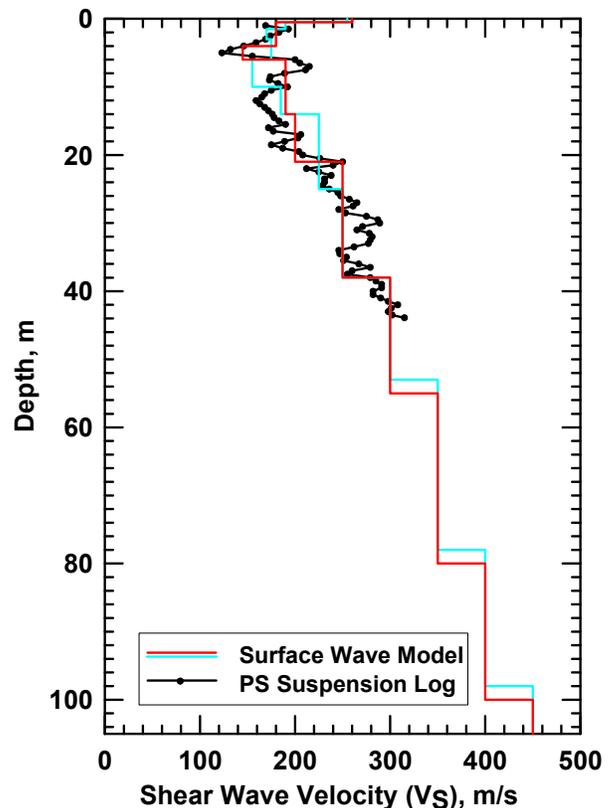

- UBC/IBC site classification for seismic design
- Earthquake site response
- Seismic microzonation
- Liquefaction analysis
- Soil compaction control
- Mapping subsurface stratigraphy
- Locating potentially weak zones in earthen embankments and levees

### Case History

The figures below show the surface wave dispersion curves and alternative shear wave velocity models for a site in Los Angeles, California. All of the previous figures illustrating SASW, MASW, array and refraction microtremor techniques were from this site. The dispersion curves from all four methods are shown on the left along with the theoretical dispersion curves for alternative S-wave velocity versus depth models on the right. Conditions at this site were very poor for active surface wave techniques because of the presence of very low velocity hydraulic fill. In fact, with active surface wave techniques it was only possible to image to a depth of about 12.5m with energy sources typically capable of imaging to 30m. There is excellent agreement in the dispersion curves generated from all of the methods over the overlapping wavelength ranges. The minor differences probably result from variable velocity of the hydraulic fill within the sampling volume of the specific methods. Two  $V_s$  versus depth models were generated to illustrate the difficulty modeling the highly variable, near surface velocity structure evident in the PS log. The two surface wave models yielded similar values for the average shear-wave velocity of the upper 30m ( $V_{s30}$ ), 201 and 202 m/s, illustrating that  $V_{s30}$  is much more tightly constrained than the actual layer thicknesses and velocities in the models.  $V_{s30}$  estimated from the PS log (194 m/s) is within 4% of that estimated from the two surface wave models (201 and 202 m/s). The small differences in  $V_{s30}$  between the two methods may easily result from the different sampling regimes (borehole versus large area) rather than errors in either of the methods.

**Field Data and Theoretical Dispersion Curve**

**$V_s$  Model**

In contrast to borehole measurements which are point estimates, surface wave testing is a global measurement, that is, a much larger volume of the subsurface is sampled. The resulting profile is representative of the subsurface properties averaged over distances of up to several hundred feet. Although surface wave techniques do not have the layer sensitivity or accuracy (velocity and layer thickness) of borehole techniques; the average velocity over a large depth interval (i.e. the average shear wave velocity of the upper 30m or 100ft) is very well constrained. Because surface wave methods are non-invasive and non-destructive, it is relatively easy to obtain the necessary permits for testing. At sites that are favorable for surface wave propagation, active and passive surface wave techniques allow appreciable cost and time savings.

# HVSR METHOD

## HORIZONTAL/VERTICAL SPECTRAL RATIO (HVSR) METHOD

### Overview

The HVSR method is a single station passive seismic method for estimating the fundamental site period (frequency), which is related to the thickness and average shear (S) wave velocity of the sediments overlying bedrock. It should be noted that the HVSR frequency peak is typically very close to, but not always identical to, the fundamental site frequency. Passive seismic techniques involve the recording of ambient noise emanating from ocean wave activity, atmospheric conditions, wind effects, traffic, industrial activity, construction activities, etc., and collectively are referred to as microseisms. Typically, microseisms with frequencies below 1 Hz have natural origins, whereas those with frequencies above 1 Hz are largely due to human activities. The HVSR technique is most often utilized as part of seismic microzonation studies of sedimentary basin, but is recently finding use in hydrogeologic studies to identify potential drill sites with bedrock at the greatest depth.

**Tromino ENGR used for HVSR measurements in shallow basins**

### Procedure

The HVSR method uses a 3-component seismometer to record ambient noise for a period of time between 15 minutes and several hours depending on the estimated thickness of the sediments and ambient noise conditions. The ratio of the Fourier amplitude spectra of the horizontal and vertical components is calculated to determine the frequency of the maximum HVSR response, commonly accepted as an approximation of the fundamental frequency ( $f_0$ ) of the sediment column overlying bedrock.

There are several options for interpreting HVSR data, depending upon the objectives of the investigation, including: joint inversion of the HVSR curve or peak frequency with surface wave dispersion curves, quarter-wavelength correlation, or simple empirical analysis using HVSR data collected at locations with known bedrock depth.

The quarter-wavelength approximation is:

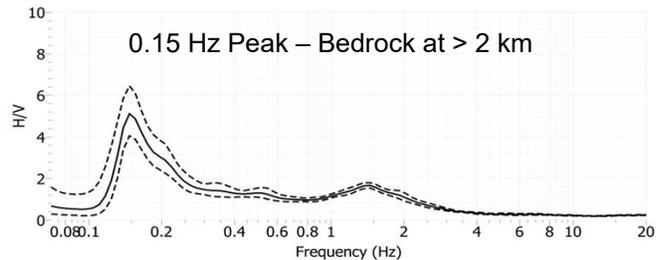

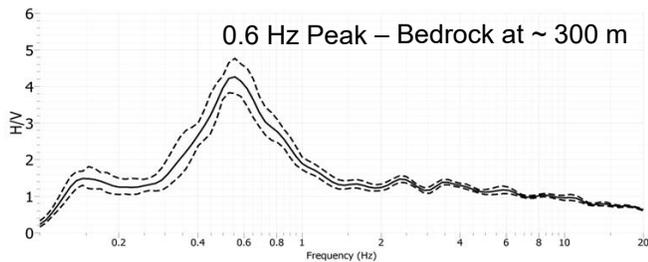

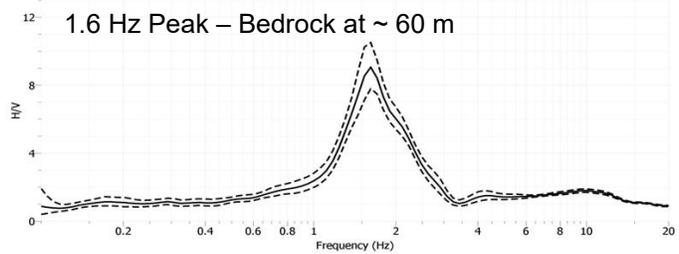

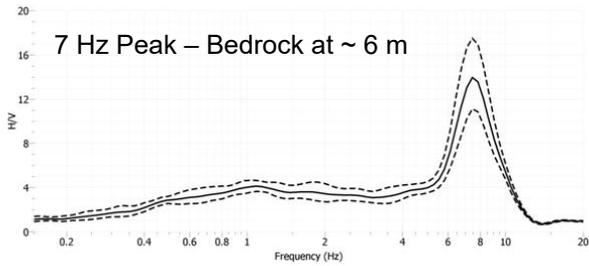

$$f_0 = \frac{\bar{V}_S}{4z}$$

where  $f_0$  is the site fundamental frequency,  $\bar{V}_S$  is the average shear-wave velocity of the soil column overlying bedrock at depth  $z$ . *This relationship* can be used to estimate the average shear wave velocity profile of the sediments when depth to bedrock is known or vice versa. As evident in this relationship, the fundamental site frequency is inversely proportional to bedrock depth; therefore, shallow bedrock will be associated with a high frequency peak and vice versa. If active and passive surface wave soundings are conducted in the deeper portion of sedimentary basins, it may be possible to develop an average S-wave velocity versus depth profile for the basin and use this along with the HVSR frequency peak to estimate bedrock depth. Alternatively, HVSR measurements can be made at locations with known depth to bedrock and a correlation between HVSR peak frequency and bedrock depth developed.

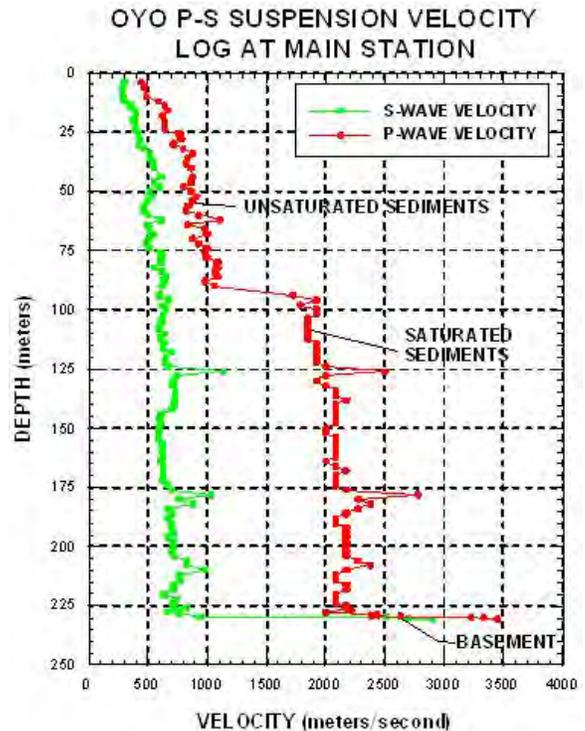

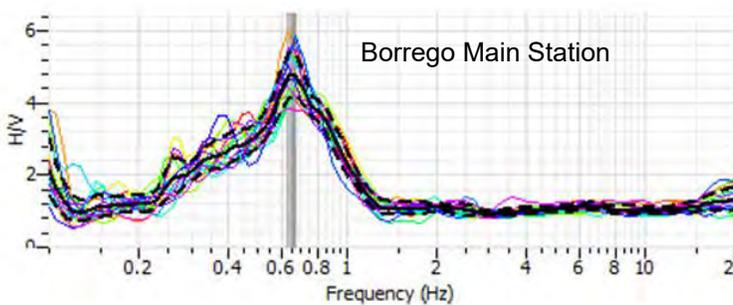

**Trillium Compact 120 second seismometer used for HVSR measurements in deep basins**

The figures below show HVSR data collected at sites with different approximate basement depths. Sites with shallow rock will have HVSR peaks at several Hz, while deep sedimentary basins will have HVSR peaks at a fraction of a hertz.

The figures below demonstrate the effectiveness of the quarter-wavelength approximation. At this site near Borrego Springs, California, a PS Suspension log was acquired in a borehole that encountered bedrock at a depth of 229 m. The PS Suspension log indicates that the average S-wave velocity of the sediments overlying bedrock is about 572 m/s. The HVSR peak at this site is 0.65 Hz which, combined with the average velocity of the sediments, indicates that bedrock is about 220 m deep, within 4% of that encountered in the borehole.

HVSR testing can be used for:

- Seismic microzonation studies.
- Confirming that the velocity structure is 1-D beneath large active/passive surface wave arrays.
- Reduce non-uniqueness in S-wave velocity models developed from surface wave testing through joint inversion.
- Estimate relative depth to bedrock for hydrogeologic studies.

Subject: Geophysical Investigation:  
*SFMTA Potrero Facility Rebuild*  
San Francisco, California  
NORCAL Project No. NS225145

Attention: Ms. Jenna Fontaine

Dear Ms. Fontaine,

This report presents the findings of a geophysical investigation performed by NORCAL Geophysical Consultants, Inc., a Terracon company (NORCAL), for Langan Engineering and Environmental Services, Inc. (Langan). The investigation was performed for the SFMTA Potrero Facility Rebuild project located along Hampshire Street between 17<sup>th</sup> and Mariposa Streets in San Francisco, California. The investigation consisted of the seismic refraction (SR) & multichannel analysis of surface waves (MASW) geophysical methods.

This geophysical investigation is supplemental to a geotechnical investigation currently underway by Langan. The work was authorized under a Langan Subcontractor Authorization for Langan Project No. 770691710 dated March 31, 2023. NORCAL Professional Geophysicist David T. Hagin (CA PGp No. 1033) and Staff Geophysicist Matthew N. LaRiviere conducted the survey on March 30, 2023.

The scope of NORCAL's services for this project consisted of using geophysical methods to characterize the subsurface. The accuracy of our findings is subject to specific site conditions and limitations inherent to the techniques used. We performed our services in a manner consistent with the standard of care ordinarily exercised by members of the profession currently employing similar methods. No warranty, with respect to the performance of services or products delivered under this agreement, express or implied, is made by NORCAL.

We appreciate having the opportunity to provide our services for this project. If you have any questions or require additional geophysical services, please do not hesitate to call on us.

Sincerely,

**NORCAL Geophysical Consultants, Inc.**

## 1.0 INTRODUCTION

A rebuild is planned for the Potrero SFMTA facility in South San Francisco. “*The Potrero Yard Modernization Project will replace an obsolete, century-old bus yard with a modern, three-story, efficient bus maintenance and storage facility, equipped to serve the SFMTA’s growing fleet as it transitions to battery electric buses*” (sfmta.com). A geotechnical investigation is currently underway by Langan for this project. They will use the information from this geophysical survey to aid in the planning and design for foundations and other structural elements of the planned improvements.

The geophysical investigation comprised two methods: seismic refraction (SR) and multichannel analysis of surface waves (MASW) surveys. The SR method provides p-wave velocity values that may aid in determining the consolidation, cementation, or hardness of the underlying lithologic materials. The MASW method produces s-wave velocity values that can provide information regarding the relative strength of the underlying geology, which can be used to assess the seismic site class (Vs30).

## 2.0 SITE CONDITIONS

The following description of site conditions is derived from our observations during the survey and a review of publicly available aerial photographs, geologic and topographic maps.

Item	Description
<b>Site Information</b>	The survey site is located along Hampshire Street between 17 <sup>th</sup> and Mariposa Streets in San Francisco, California. The approximate geographic coordinates of the center of the site are: (37°45'49.9"N 122°24'27.0"W).
<b>Survey Site</b>	The seismic surveys were performed on an asphalt-covered, street-side parking area to the east of the current structure.
<b>Existing Topography</b>	Based on our Trimble Geo7X GPS, Google Earth and site observations, the site consists of relatively flat terrain that slopes very slightly southward. Surface elevations range from about 50- to 72-ft (NAVD88).
<b>Site Geology</b>	Available geologic maps (USGS OFR 2006-1037; CGS 2002, 2003) indicate that the site geology is near the mapped border of Quaternary age sand deposits to the southwest and Mesozoic ultramafic rocks to the northeast.

## 3.0 SCOPE OF WORK

Our scope of work included acquiring seismic data consisting of both SR to measure primary compressional-wave (p-wave), and MASW to quantify secondary shear-wave (s-wave) values. Data acquisition consisted of one SR line, designated as Line SR-1, and two MASW soundings, denoted MASW-1 and MASW-2.

Aerial photographic images showing the site vicinity and the locations of the seismic surveys are provided on **Plate 1 – Site Location Map**, as detailed in the legend. To provide documentation of our investigation, this geophysical report includes the site location map, details of our data acquisition and processing, as well as the resulting SR profile and MASW shear-wave models, presented in both tabular and graphic form.

## 4.0 SEISMIC REFRACTION SURVEY

### 4.1 SR SURVEY METHOD

The SR method is designed to measure subsurface variations in the compressional (P-) wave velocities, which will be denoted herein as “Vp.” Variations in Vp can be indicative of variations in the density and elastic properties of subsurface materials. The Vp values can typically be interpreted to differentiate between bedrock and overburden, as well as to evaluate the underlying bedrock. The SR method provides both vertical and lateral variations in the Vp of subsurface materials. These measurements can then be used to produce a two-dimensional (2D) cross-section (profile) illustrating variations in Vp versus depth and distance beneath the seismic line.

Typically, Vp is dependent on physical properties such as density, hardness, compaction, and induration. However, other factors such as bedding, fracturing and saturation also affect Vp. In general, the Vp of weathered rock and consolidated or cemented sedimentary deposits are higher than those of unconsolidated sediments or fill material. Within rock, higher Vp values typically correspond with harder, less weathered and/or fractured rock. Therefore, the configuration of Vp values may aid in determining the thickness of sedimentary and soil layers (overburden), and the character of the underlying bedrock.

Detailed descriptions of the SR methodology, the instrumentation we used, our data acquisition, analysis and interpretation procedures as well as the general limitations of the method are provided in **Appendix A – Seismic Refraction Survey**.

### 4.2 SR PROFILE

The results of the SR survey are illustrated by the color contoured seismic velocity cross-section (profile) shown on **Plate 2 – Seismic Refraction Profile**. The vertical axis represents elevation (NAVD88), and the horizontal axis represents the survey stationing established for the SR line, with the zero-value at the northwestern end of the line. The unit of measure for both axes is the US Survey Foot. The solid black line along the top of the contoured portion of the profile represents the ground surface. The maximum depth of investigation is determined by the greatest shot-to-receiver distance and is estimated to be 50-ft below ground surface.

### 4.3 SEISMIC P-WAVE VELOCITY VALUES

Seismic p-wave velocity ( $V_p$ ) is represented by the labeled contours and the color shading between contours and is presented in feet per second (ft/sec). The relationship between color and  $V_p$  is specified by the color scale shown below each profile. The color scales are identical (normalized) for ease of comparison.

The  $V_p$  measured by the seismic refraction survey range from slightly less than 1,000 ft/sec near the surface to greater than 10,000 ft/sec at depth. This velocity range can be differentiated into three sub-ranges which we define herein as low, moderate and high.

- *Low  $V_p$*  range from approximately 1,000 to 4,500 ft/sec and are represented by tan to yellow shading.  $V_p$  in this range typically represent unsaturated surficial soils, poorly consolidated sedimentary deposits or fill.
- *Moderate  $V_p$*  range from 4,500 to 6,500 ft/sec and are represented by shades of green to blue.  $V_p$  in this range typically represent more consolidated, cemented or saturated sediments and/or weathered rock.
- *High  $V_p$*  range from 6,500 to over 10,000 ft/sec and are represented by varying shades of maroon, typically representing rock with varying degrees of weathering. As  $V_p$  increases, weathering and/or fracturing typically decrease.

### 4.4 OBSERVATIONS

The distribution of  $V_p$  values allows for a general interpretation of thickness of soils and sediments and depth-to-rock, drawn from the  $V_p$  interpretations presented in Section 4.3.

- The profile for Line SR-1 shows high  $V_p$  (maroon) across the bottom of the profile, dropping in elevation toward the southwest, likely indicating the presence of hard rock. The high  $V_p$  are near 20-ft deep at the northwest end of the profile and drop to about 45-ft at the southwest end.
- Moderate  $V_p$  values (blue, green) are moderately thin on the northern end of the profile and thicken considerably toward the south, varying from about 15- to 30-ft thick. These values may represent the dune sands overlying the ultramafic rock. The sands are mapped toward the southwest, as indicated on the geologic map (CGS 2002, 2003).
- The upper portion of the profile shows 5- to 10-ft of surficial low  $V_p$  (tan, yellow), likely representing a layer of soils and/or poorly consolidated sedimentary deposits.

## 5.0 MASW SURVEY

### 5.1 MASW SURVEY METHOD

The Seismic Multichannel Analysis of Surface Waves (MASW) sounding survey measures the shear-wave ( $V_s$ ) velocities of the subsurface as a function of depth. The method used for this survey is referred to as a sounding, producing one-dimensional (1D) data that are presented in both tabular and graphic form as a layered shear wave model. The location of each sounding is the center of the geophone array. Descriptions of the MASW methodology, our data acquisition and analysis procedures, and the instrumentation we employed are provided in **Appendix B – MASW Sounding Survey**.

The standard method of reporting MASW data is to consider the location of the 1D velocity vs. depth model as the center point of the MASW array. However, this does not mean that the measured velocity values represent materials solely beneath that location. In fact, the subsurface conditions underlying the entire length of the array, and for several tens of feet to either side, contribute to the measured velocity values.

### 5.2 MASW TABLES AND STEP-CHART GRAPHS

The results of the MASW survey are listed in the tables presented in Section 5.3. The left columns of each table contain the depth ranges for each layer (feet below ground surface) and the right columns comprise the associated  $V_s$  values in feet per second (ft/sec). The results are also presented graphically in ft/sec by the step charts shown on **Plates 3 and 4 – MASW Soundings**.

The maximum depth of investigation is determined by the longest wavelength (lowest frequency) measured by the survey, which is a function of the site geology, the geophone spacing and the array length. The maximum depth of exploration for each sounding is approximated as 100-ft below ground surface. Note that although  $V_s$  generally increase with depth, both data sets indicate velocity inversions (lower  $V_s$  beneath higher  $V_s$ ).

### 5.3 SEISMIC S-WAVE VELOCITY VALUES

The s-wave layered models for MASW-1 and MASW-2 are presented by the following tables:

*MASW-1: Seismic S-Wave Velocity vs Depth*

<b>DEPTH RANGE (FT)</b>	<b>S-WAVE VELOCITY (FT/SEC)</b>
0 - 3	2,380
3 - 7	2,680
7 - 12	2,940
12 - 18	2,210
18 - 26	1,240
26 - 36	2,080
36 - 48	3,910
48 - 64	4,200
64 - 83	2,060
83 - 100	3,690

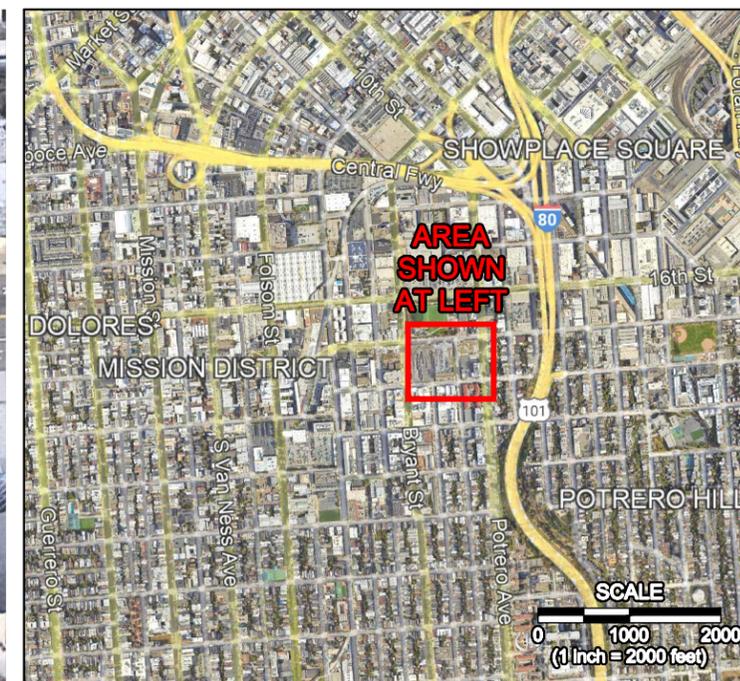

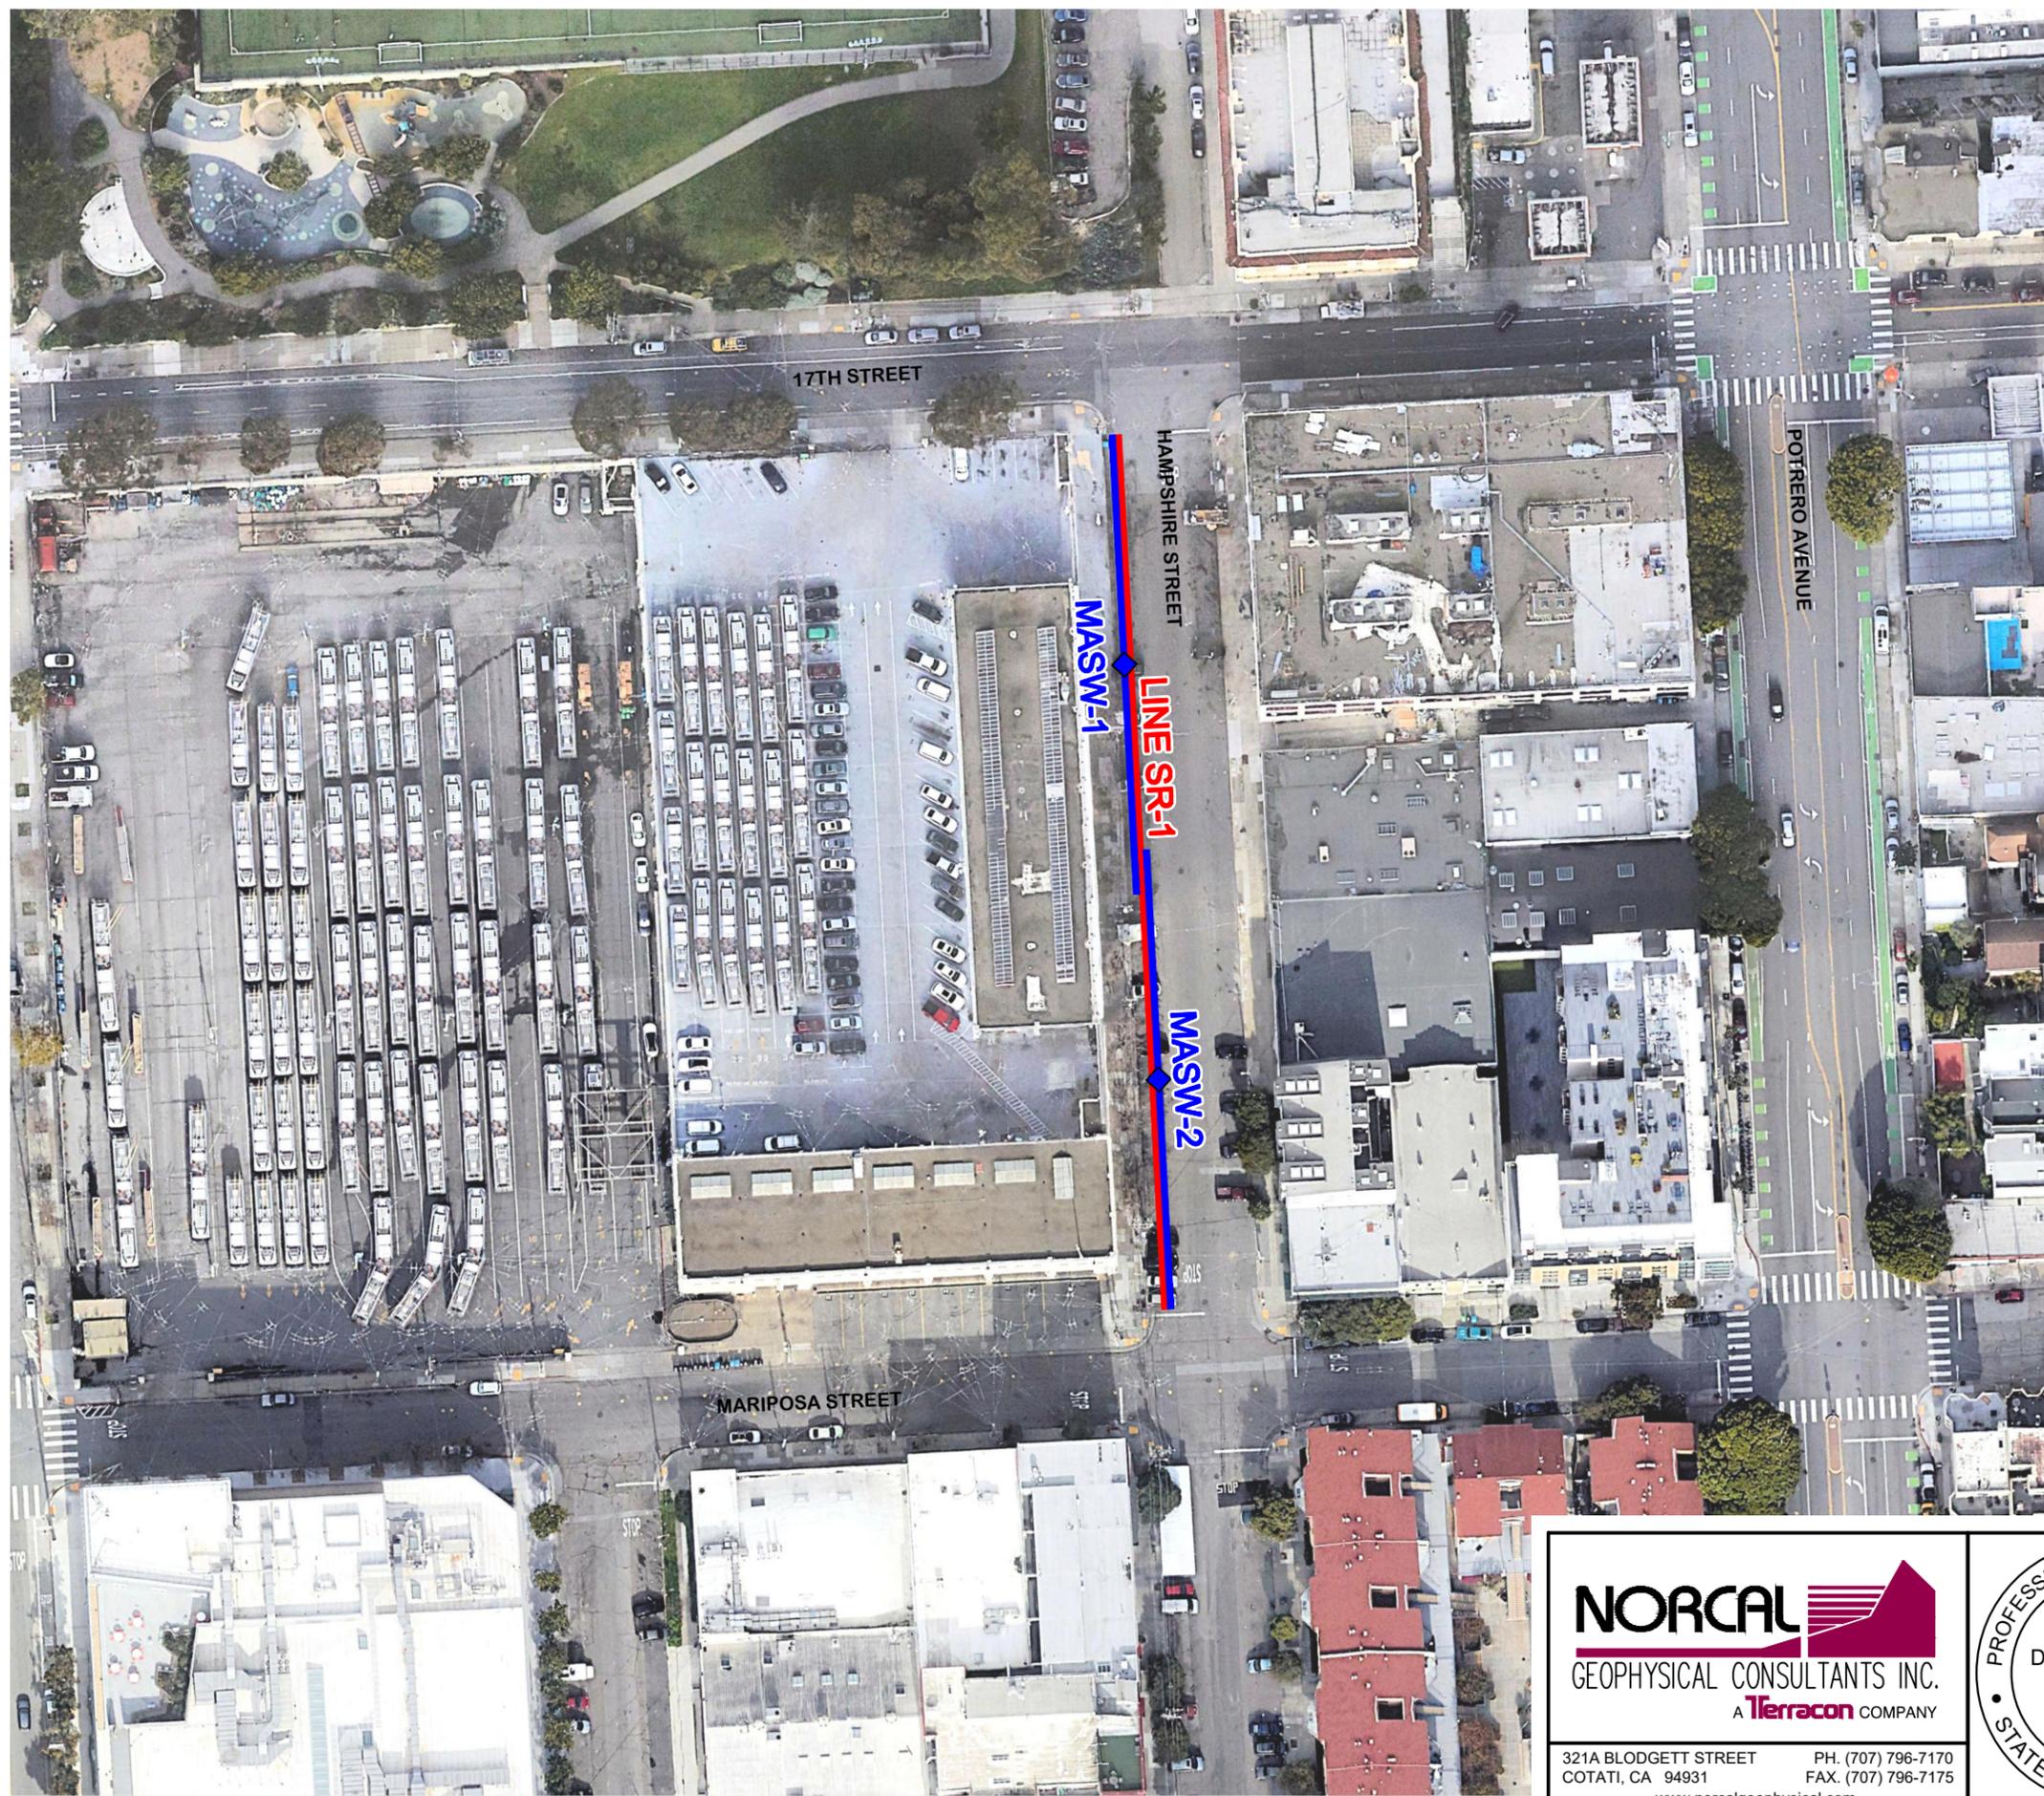

*MASW-2: Seismic S-Wave Velocity vs Depth*

<b>DEPTH RANGE (FT)</b>	<b>S-WAVE VELOCITY (FT/SEC)</b>
0 - 2	1,910
2 - 6	2,050
6 - 9	2,140
9 - 14	2,100
14 - 20	1,790
20 - 28	1,320
28 - 37	1,600
37 - 49	2,900
49 - 63	3,720
63 - 100	5,360

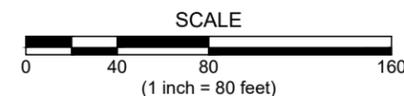

The measured Vs values for both soundings range from a low of 1,240 ft/sec to a maximum of 5,360 ft/sec. It is possible that some of the measured shallow layer velocities may be increased due to the proximity of building foundations or other man-made structures.

## 6.0 DISCUSSION

The SR profile appears to generally agree with the general geology (USGS), as the interpreted rock appears to decrease in depth towards the north where ultramafic rock is mapped. The SR and MASW data sets show good correlation to one another within the range defined on the SR profile.

**APPENDIX A:**  
**Seismic Refraction Survey**

## **APPENDIX A:**

### **Seismic Refraction Survey**

#### **1.0 METHODOLOGY**

The seismic refraction method provides information regarding the seismic velocity structure of the subsurface. An impulsive (mechanical or explosive) energy source is used to produce compressional (p-) wave seismic energy at the surface. The p-waves propagate into the earth and are refracted along interfaces caused by an increase in velocity. A portion of the p-wave energy is typically refracted back to the surface where it is detected by sensors (geophones) that are coupled to the ground surface in a collinear array (spread). The detected signals are recorded on a multi-channel seismograph and are analyzed to determine the shot point-to-geophone travel times. These data can be used along with the corresponding shot point-to-geophone distances and elevation data to determine the depth, thickness, and velocity of subsurface seismic layers.

#### **2.0 INSTRUMENTATION**

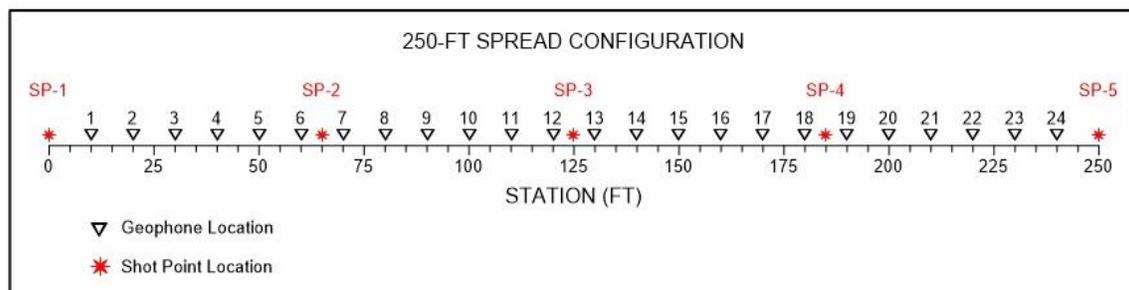

The seismic waveforms produced at each shot point were recorded using a Geometrics **Geode** 24-channel engineering distributed array seismograph, as pictured in Figure 1, and **RT Clark** geophones with a natural frequency of 4.5 Hz. The geophones were coupled to the ground surface by a metal spike affixed to the bottom of each geophone case. Seismic energy was produced at each shot point by multiple impacts with a 16-pound sledgehammer against a metal strike plate placed on the ground surface. The seismic waveforms were digitized, processed, and amplified by the Geode, transmitted via a ruggedized Ethernet cable to a field computer and algebraically summed (stacked) until sufficient signal to noise ratio was achieved. The data were displayed on the computer's LCD screen in the form of seismograms, analyzed for quality assurance and archived for subsequent processing. These images were subsequently used to determine the time required for P-waves to travel from each shot point to each geophone in the array (spread).

**Figure 1:** Geometrics Geode 24-channel engineering distributed array seismograph.

### 3.0 DATA ACQUISITION

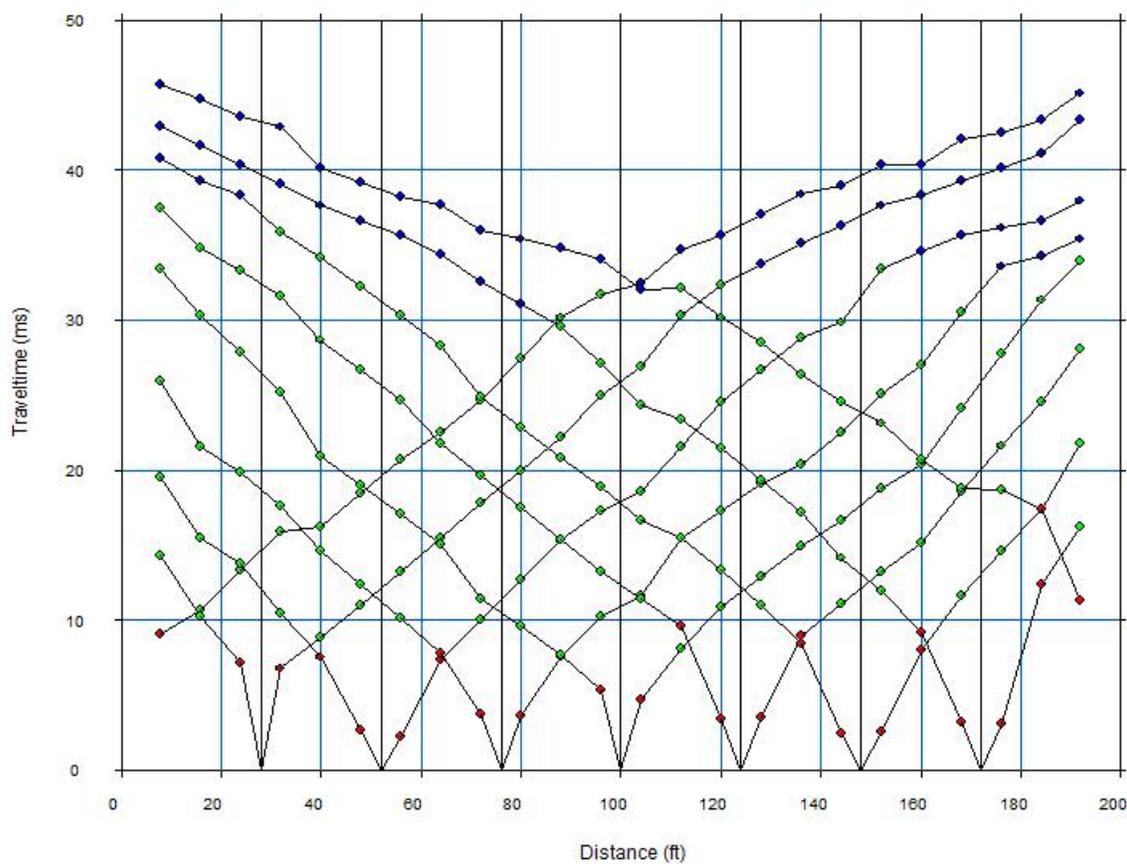

We collected SR data along a single line, designated as Line SR-1, as described in the main body of the report. The line location is shown by the red line on the site location map (Plate 1). Langan personnel determined the location and orientation of the SR line. Data were acquired using arrays of 24 geophones with 10-ft spacing and 5 shot-points at approximately 60-ft intervals, as shown in Figure 2. Shot-points were placed off each end of the geophone arrays as well as distributed equally within each array, yielding a 250-ft length for each array. Two overlapping arrays were acquired to reach the 400-ft line length required. The maximum depth of investigation is determined by the greatest shot-to-receiver distance and is estimated to be 50-ft.

**Figure 2:** SR Array configuration.

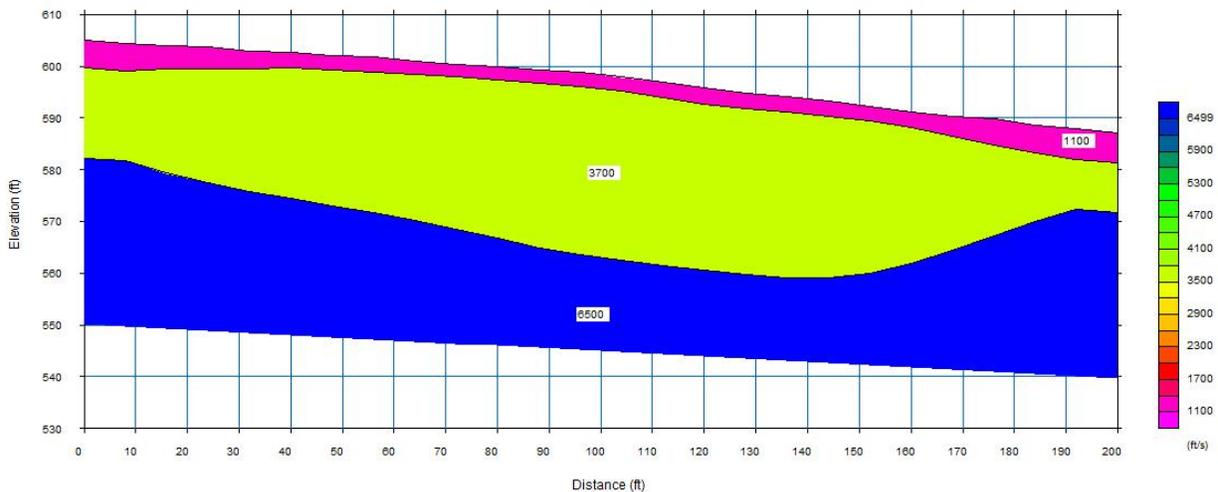

## 4.0 DATA ANALYSIS

The seismic refraction data were processed using the software package **SeisImager**, written by Oyo Corporation (Japan) and distributed by Geometrics Inc. This package consists of two programs titled **Pickwin**, Version 5.1.1.2 (2013) and **Plotrefa**, Version 3.0.0.6 (2014). For each seismic line we used **Pickwin** to view the seismic records and identify first arriving P-wave energy at each geophone and to determine the shot point to geophone travel time associated with each arrival. We then used **Plotrefa** to assign elevations to each geophone and to plot the shot point to geophone travel times versus their distance (Station) along the line. A sample Time versus Depth (T-D) graph is shown in Figure 3.

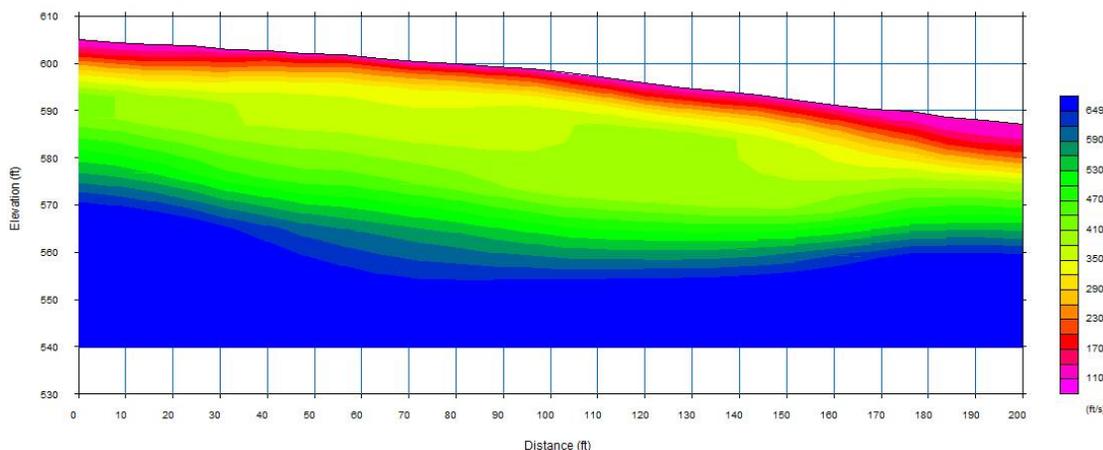

**Figure 3:** Sample SR Time-Distance Graph. Red circles represent layer 1 (V1), green circles represent V2 and blue circles represent V3.

After examining the T-D graph we assigned velocity layers (1-3) to each travel time and then computed a 2D model using **Plotrefa's** time-term routine. This resulted in a 2D layered cross-section (profile) illustrating seismic velocity versus depth. A sample 2D time-term model is shown in Figure 4.

**Figure 4:** Sample Time-Term Seismic Velocity Model. Velocities are labeled and indicated by the color bar on the right.

Finally, we used the time term model as input to **Plotrefa's** tomographic routine. This routine divided the input model into cells according to the geophone spacing and depth range and assigned a velocity to each cell. It then used a ray-tracing routine to compute synthetic travel times through the model from each shot point to every geophone. The synthetic travel times were compared with the observed travel times to determine the goodness of fit. If the fit was not within certain assigned parameters, the program then adjusted the velocity in each cell and reran the ray tracing. This procedure was repeated through as many as 20 iterations in order to achieve the optimum fit between observed and synthetic travel times. A sample tomographic model is shown in Figure 5.

**Figure 5:** Sample tomographic Inverted Seismic Velocity Model. Velocities indicated by color bar on right.

Once the tomographic processing was complete, we used the computer program **Surfer 21.2** by Golden Software to construct a color contoured 2D cross-section (profile) illustrating the results for each seismic line.

## 5.0 INTERPRETATION

The SR profiles described above are models of the subsurface based on P-wave velocities. How these velocities and their subsurface distribution relate to geology is a matter of interpretation. This interpretation can be based on experience and a general knowledge of the local geology. However, the best results are achieved when the models can be correlated with subsurface information provided by other means such as onsite observations, borehole geological and/or geophysical logs, trench logs or projections based on mapped surface geology. This type of information is referred to as “ground truth”.

In any case, the resulting seismic velocity profile represents a model of the subsurface that must be interpreted by the best means available. Thus, the interpreted profile is conceptual in nature, and is not expected to represent an exact depiction of the subsurface.

## 6.0 LIMITATIONS

Based on the physical properties of refraction (Snell’s Law), in order for a seismic wave to be refracted back toward the surface, the seismic velocity of the upper layer must be less than the velocity of the lower layer. When higher velocities overlie lower velocities, often referred to as a velocity inversion, the seismic energy will be refracted downward and the lower layer will not be detected at the surface. As a result, the calculated depths of any deeper higher velocity layers may be over-estimated. Furthermore, some layers may be truncated or too thin to detect. These are referred to as “hidden layers”.

If the seismic source used for the survey does not produce sufficient energy to propagate through the entire spread at detectable levels, the first arriving P-waves at each geophone may not be visible on the seismic records. Additionally, extraneous seismic energy sources such as wind, traffic or nearby machinery may create “noise” on the recorded waveforms that may mask the first arrivals.

Another common external noise source is overhead power lines. If the cable is laid out parallel to the lines electrical noise may be induced in the cable. Possible internal noise sources may be faulty geophone connections due to dirt or moisture or use of an unsuppressed power supply.

In noisy conditions many “stacks” (multiple shots) may be necessary to achieve an acceptable signal-to-noise ratio. Stacking consists of superposition of waveforms such that the stacked shot energy builds with successive shots, whereas the noise tends to cancel itself out due to its random nature. In extremely noisy conditions it may not be possible to achieve an acceptable signal-to-noise ratio for the greatest shot-to-receiver distance, possibly reducing the maximum depth of investigation.

Finally, seismic refraction processing algorithms are based on the assumption that the seismic velocity layers are isotropic. That is, that the velocity is uniform within the length and breadth of each layer. Another assumption is that the velocity distribution does not change in a direction transverse to the seismic line. In other words, that there is true 2D symmetry. If these conditions are not met, the actual subsurface conditions will vary from those represented by the seismic model.

**APPENDIX B:**  
**MASW Sounding Survey**

## **APPENDIX B:**

### **MASW Sounding Survey**

#### **1.0 METHODOLOGY**

When seismic energy is generated at or near the ground surface, both body and surface waves are produced. Body waves expand omni-directionally throughout the subsurface. They consist of both compressional (P) and shear (S) waves. Surface waves (e.g., Rayleigh, Love, etc.) radiate along the ground surface at velocities that are proportional to shear wave velocity ( $V_s$ ). Rayleigh waves are characterized by retrograde elliptical particle motion, and travel at approximately 0.9 times the velocity of S-waves.

If a vertical impact source is used, approximately two-thirds of the seismic energy that is produced is in the form of ground roll. As a result, surface waves are typically the most prominent signal on multi-channel seismic records. In addition, surface waves have dispersion properties that body waves lack. That is, different wavelengths have different penetration depths and, therefore, propagate at different velocities. By analyzing the dispersion of surface waves, it is possible to obtain an S-wave versus depth velocity profile. Since s-wave velocity is directly proportional to shear modulus, this provides a direct indication in the variation of stiffness (or rigidity) of subsurface materials.

Surface waves can be recorded and analyzed using a method referred to as Multichannel Analysis of Surface Waves (MASW). This method is used to collect surface wave data using a fixed array of geophones and shot points. This is referred to as a sounding, and results in a one-dimensional (1D) model depicting variation in S-wave velocity versus depth beneath the center of the array. However, the subsurface conditions underlying the entire length of the array, and for several tens of feet to either side, contribute to the measured velocity values. The method requires an energy source that is capable of producing ground roll and geophones that are capable of detecting low frequencies (<10 Hz) signals.

#### **2.0 INSTRUMENTATION**

The seismic waveforms produced at each shot point were recorded using a Geometrics **Geode** 24-channel engineering distributed array seismograph, as pictured in Figure 1, and **RT Clark** geophones with a natural frequency of 4.5 Hz. The geophones were coupled to the ground surface by a metal spike affixed to the bottom of each geophone case. Seismic energy was produced at each shot point by multiple impacts with a 16-pound sledgehammer against a metal strike plate placed on the ground surface. The seismic waveforms were digitized, processed and amplified by the Geode, transmitted via a ruggedized Ethernet cable to a field computer and algebraically summed (stacked) until sufficient signal to noise ratio was achieved. The data were displayed on the computer's LCD screen in the form of seismograms, analyzed for quality assurance and

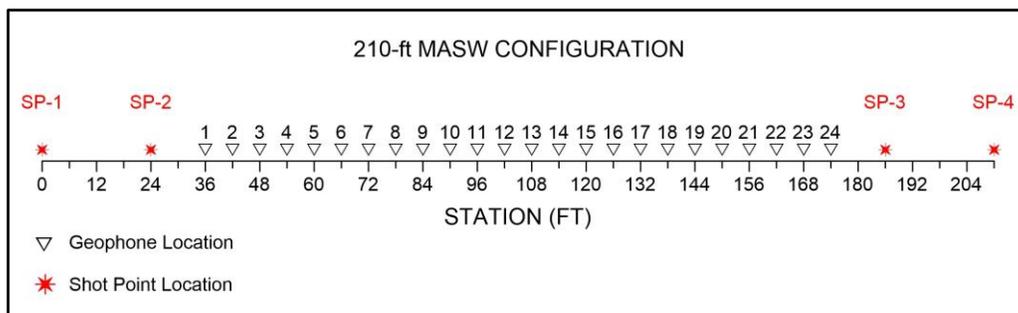

archived for subsequent processing. These images were subsequently used to determine the time required for P-waves to travel from each shot point to each geophone in the array (spread).

**Figure 1:** Geometrics Geode 24-channel engineering distributed array seismograph.

### 3.0 DATA ACQUISITION

We acquired two MASW soundings, designated as MASW-1 and MASW-2, as described in the main body of the report. The sounding locations were determined by Langan personnel. The positions of the MASW arrays are shown by the blue lines on the site location map (Plate 1). The center points of the arrays, which are considered the sounding locations, are represented by the blue diamonds. For each sounding, the seismic equipment was set out in a collinear array consisting of 24-geophones and four shot-points. The geophone stationing interval was 6-ft and shot-points were placed 2- and 6-stations off each end of the arrays, for a total line length of 210-ft. The maximum depth of exploration is determined by the frequency content of the seismograms and is estimated at 100-ft for each sounding. The configuration of each seismic array is depicted by the diagram in Figure 2, below.

**Figure 2:** MASW Array Configuration.

## 4.0 DATA ANALYSIS

The seismic wave-traces (shot gathers) recorded at each shot point were analyzed using the computer program **SURFSEIS** developed by the Kansas Geological Survey (Version 5.0, 2016). This interactive program converts the data acquired from all four shot points in a given sounding into a dispersion curve representing phase velocity versus frequency. This curve is then inverted to produce a 1D model indicating S-wave velocity versus depth. The steps involved in this procedure are as follows:

- 1) The shot gathers are converted to KGS format.
- 2) Stations are assigned to the geophone and shot point locations.
- 3) The resulting records are viewed to determine their overall quality. If necessary, portions of the records are muted to remove interference from refractions, reflections and higher mode events.
- 4) For each formatted (and/or muted) record, the program produces what is referred to as an “overtone plot”. This is a colored cross-section indicating phase velocity versus frequency and amplitude. The vertical axis represents phase velocity (increasing upward); the horizontal axis represents frequency (increasing to the right); and signal amplitude is indicated by various colors, with the hottest colors (orange to red to dark brown) representing the greatest signal to noise ratio. Typically, the strongest signals align in a curved pattern with a symmetry with the shape of a “hockey stick” where the blade is pointing upward at the lower end of the frequency spectrum (higher velocity at greater depth) and the handle projects to the right in the direction of increasing frequencies indicating lower velocities.
- 5) The overtone plots compiled from the four shot points are reviewed to determine their overall quality and the best among them (possibly all) are merged to form a single overtone. This enhances the overall signal to noise ratio of the survey and incorporates data from both ends of the spread (if feasible).
- 6) The resulting overtone plot is used as a guide in deriving a dispersion curve representing phase velocity versus frequency. This is done by fitting the curve along the center of the hockey stick where the signal to noise ratio is highest.
- 7) The resulting dispersion curve is inverted through an iterative process to compute a 1D model representing S-wave velocity versus depth.

The shear-wave velocities in each depth range for the soundings are tabulated in Section 5.3 of the main body of the report. The results are also presented graphically by the step-chart graphs on Plates 3 and 4.

## 5.0 LIMITATIONS

Extraneous seismic energy sources such as wind, traffic or nearby machinery may create “noise” on the recorded waveforms. Also, live electric lines may induce unwanted electrical current into the seismic cable, also creating noise. If the seismic source used for the survey does not produce sufficient energy to propagate through the entire spread at detectable levels, the wave forms created by the surface waves may be overly contaminated by noise and reduce the signal-to-noise ratio and thus the data quality.

In noisy conditions many “stacks” may be necessary to achieve an acceptable signal-to-noise ratio. Stacking consists of superposition of waveforms such that the stacked shot energy builds with successive shots whereas the noise tends to cancel itself out due to its random nature. In some cases, however, noise is not sufficiently random to be reduced to acceptable levels.

# Introduction

This Division 4 sets forth supplemental design criteria for the Project. These supplemental design criteria shall apply together with other design criteria and requirements set forth in the Technical Requirements.

As described in Division 1 and elsewhere in the Technical Requirements, the Project must fully enable the design, construction, operations and maintenance of either Joint Development Alternative. While complying with these requirements, the Principal Project Company shall demonstrate how possible noise, vibration, or seismic impacts to each Joint Development Alternative are taken into account and mitigated.

## 1 Supplemental Noise and Vibration Requirements

The Principal Project Company shall comply with these supplemental noise and vibration requirements in the design of the Project..

### 1.1 Intent of these Supplemental Noise and Vibration Requirements

Principal Project Company shall demonstrate through engineering analysis that the Project’s design will comply with the applicable noise and vibration requirements included in this Division 4 and Division 3.

Engineering analysis refers to industry-standard or project-specific approaches (with technical back-up) that present the basis and results of airborne source-path-receiver calculations (and the same for structure-borne noise and vibration transmission where noted to be required), along with uncertainty estimation.

These supplemental noise and vibration requirements establish:

1. Project criteria for noise and vibration; and
2. Deliverable requirements for the noise and vibration scope.

The criteria for noise and vibration are established in the following categories:

<i>Environmental Noise</i>	Includes all systems and operations, which shall be designed to comply with outdoor noise restrictions governed by applicable Laws.
<i>MEP Systems Noise and Vibration</i>	Includes: mechanical, HVAC, electrical, plumbing, vertical transportation, power generation and back-up systems, window cleaning and building maintenance systems, and other specialty systems that may generate noise or vibration.

<i>Building Envelope Sound Isolation / CalGreen</i>	Includes sound isolation performance of the building façade and the remainder of the Infrastructure Facility building envelope, which shall comply with these supplemental noise and vibration requirements.
<i>Acoustic Separation of Spaces</i>	Includes airborne sound transmission performance of demising constructions separating adjacent spaces. Composite calculations are required for constructions with multi-component floor/ceiling and partition/ door/ window systems. This includes estimation of flanking paths from ductwork, cable-passes and shaft-ways, and project-specific architectural detailing.
<i>Interior Room Acoustics</i>	Includes project requirements for interior room acoustics such as reverberation time and/or occupational noise levels to support the intended programmatic usage of spaces.
<i>Structure-borne Vibration</i>	This category specifically pertains to the transmission of structure-borne noise and vibration from the Project systems and operations (primarily, but not exclusively, from bus operations and maintenance equipment that are part of the Bus Yard Component) to other areas.

## 1.2 Acoustic Consultant Qualifications

Principal Project Company shall, through Substantial Completion, engage the services of a qualified, independent acoustics and vibration consulting firm (“acoustic consultant”) with a minimum of 10 years of relevant acoustics and vibration consulting experience with projects of type and complexity similar to the Project. The acoustics consultant shall have proven and demonstrated capabilities (as demonstrated by a minimum of three projects) both in predictive analysis of structure-borne vibration transmission and re-radiated noise in buildings. The acoustic consultant shall also have related experience in site testing and commissioning.

## 1.3 Applicable Codes and Standards

The latest published editions of the following codes and standards are referenced herein and made part of these supplemental noise and vibration requirements.

1. San Francisco Police Code Article 29
2. California Green Building Standards Code, Ch 5, CALGreen
3. California Uniform Building Code Title 24, with particular attention to Ch 12, Section 1206 Sound Transmission
4. International Building Code (IBC) Section 1206
5. International Code Council (ICC) G2-2010 Guidelines for Acoustics
6. If applicable: U.S. Department of Housing and Urban Development (HUD) regulation 24 CFR Part 51, Sub-part B
7. ASHRAE, American Society of Heating, Refrigerating and Air Conditioning Engineers, Fundamentals Handbook
8. NFPA 72

9. ISO 2631

10. 2018 FTA “Transit Noise and Vibration Impact Assessment Manual”

## **1.4 Acoustics, Noise, and Vibration Criteria**

Acoustics, noise, and vibration criteria for the Project are listed below. Principal Project Company confirms that design concepts and strategies it develops for the Project will meet these criteria.

For any space type not listed or specified, criteria shall be proposed by the acoustics consultant for the City’s review and approval.

### **1.4.1 Environmental Noise**

Design noise emissions from the Project to comply with the noise ordinance and requirements of San Francisco Police Code Article 29.

Limit noise emissions from the Project equipment or operations at the Project Site to no more than 55 dBA Leq, 5min for outdoor areas frequented by people. Such areas include the grounds surrounding the Project Site, including any outdoor courtyards, break areas, and other areas where people congregate or hold meetings.

Consider all non-transportation sound sources from the Project and their impact on existing and future, nearby residential properties. Non-transportation sound sources include locations of loading docks, and outdoor services docks, if any.

### **1.4.2 Background Noise Criteria from MEP Systems**

Designs for mechanical, electrical, and plumbing (MEP) building-system shall comply with the background noise criteria, as defined per occupancy type in the latest published edition of the ASHRAE Fundamentals Handbook.

Designs for occupied spaces shall comply with ASHRAE criteria for background noise level and shall exceed a noise level of NC 50. This is the highest recommended level that still allows for occupants to speak relatively comfortably without raising their voices.

Ductwork velocities shall comply with ASHRAE Fundamentals Handbook Chapter 49, 2019 edition, per room noise criteria.

For spaces that do not require speech communication and are unoccupied but require occasional occupancy (e.g., monitoring, maintenance, etc.), design the MEP systems must for a background noise level below 85 dBA in each space, to comply with the lower action limit for OSHA requirements to protect worker noise exposure.

Conduct engineering analysis for background noise level calculations in octave bands or one-third octave bands from 63 Hz to 4000 Hz spectra for each occupied space, inclusive of all system parameters including fan noise, flow-generated noise, self-generated noise of silencers, noise due to terminals, dampers, diffusers, duct breakout, radiated through partitions, structure-borne, and duct-borne noise.

Conduct a 31.5 Hz octave band analysis if there is a reasonable basis to expect high noise levels from very low frequency sources,

Occupied spaces in the Project shall be free of pure tones. A pure tone is defined as an amplitude at any 1/3-octave band center frequency that is 5dB or more above the amplitude of adjacent bands. Manufacturer's data sheets for MEP equipment shall be assessed by the acoustic consultant to confirm that equipment exhibiting pure tones is not selected.

Emergency generators and similar stand-by equipment such as smoke exhaust or stair pressurization fans shall be designed with noise and vibration control to meet the requirements of applicable local noise ordinance(s) and to limit disturbance to Project occupants during maintenance or testing, including the noise associated with any temporary load banks or load application systems.

Noise levels generated by emergency and stand-by systems shall also be considered in the analysis of emergency evacuation or paging systems that require intelligibility. NFPA-72 shall be referred to for guidance on intelligibility requirements for such systems design.

### **1.4.3 MEP Systems Vibrations Isolation**

Vibration isolation of equipment and any associated piping, as well as structural stiffness and deflection requirements of structures supporting MEP equipment shall comply with requirements in ASHRAE Fundamentals Handbook Chapter 49, 2019 edition.

### **1.4.4 Building Envelope Sound Isolation**

The Project's façade and building envelope shall comply with the requirements of California Green Building Standards Code, Ch 5, CALGreen and California Uniform Building Code Title 24, with particular attention to Ch 12, Section 1206 *Sound Transmission*.

### **1.4.5 Acoustic Separation of Spaces and Interior Room Acoustics**

Supplemental noise and vibration requirements include the 2019 California Uniform Building Code (section 1206) and 2020 California Residential Building Code (Title 24, Part 2.5, section AK102-103) for indoor sound separation, noting that these are currently in line with IBC.

Requirements for acoustic separation between demising spaces shall meet minimum standards for Class A office space in San Francisco. This includes, at minimum:

1. Open plan workspace "normal" speech privacy
  - a. background Noise: NC 40 maximum
  - b. electronic sound masking: 40 to 45 dBA if background noise levels are calculated to be less than NC-35 on average.
  - c. Sound absorbing ceiling of NRC 0.70 Minimum (ASTM C423, Type E-400 mounting)
2. Offices and meeting rooms "normal" speech privacy
  - a. background noise: NC 35 maximum

- b. minimum noise reduction of partitions: NIC 35 Minimum with sound masking and NIC 40 minimum without sound masking (noise isolation class defined per ASTM E336)
  - c. sound absorbing ceiling of NRC 0.80 minimum (ASTM C423, Type E-400 mounting)
  - d. sound absorbing wall panels on 25% of walls of NRC 0.70 minimum (ASTM C423, type-A mounting)
3. Private offices and meeting rooms “confidential” speech privacy
- a. background noise: NC 30 maximum
  - b. noise reduction of partitions: NIC 45 minimum
  - c. provide absorption of NRC 0.80 minimum on 25% of walls

For purposes of evaluating impacts to Joint Development Alternative 1, Principal Project Company shall assume the following are residential acoustic design requirements: the International Building Code and “Average” rating or greater under the U.S. Department of Housing and Urban Development Guide.

### 1.4.6 Project Vibration Criteria

Noise and vibration impacts from the operations and maintenance activities in the Infrastructure Facility shall not adversely impact any Joint Development Alternative. Vibration control systems shall be provided for all Infrastructure Facility operations and maintenance activities (including vehicle idling, vehicle movements over surface discontinuities, vehicle lifts and conveyance, tools, testing and other processes that occur within the yard), as well as all Project building systems (architectural and /or structural), such that maximum mid-span floor vibration levels shall not exceed recommended criteria for residential dwellings contained in the following two references:

1. ISO 2631 (part 1 and part 2) provides “base curves” for maximum allowable vibration in all 3 axes. For nighttime residential applications, Annex A requires no more than 1.4x the base curve. ISO requirements for steady state, transient vibration and “shock” shall be used based on the type of activity analyzed.
2. The US industry standard is the 2018 FTA “Transit Noise and Vibration Impact Assessment Manual”. See Table 6-3 below. Applicable criteria are outlined in red, as applicable to elevated residential floors of this Project.

**Table 6-3 Indoor Ground-Borne Vibration (GBV) and Ground-Borne Noise (GBN)  
 Impact Criteria for General Vibration Assessment**

Land Use Category	GBV Impact Levels (VdB re 1 micro-inch /sec)			GBN Impact Levels (dBA re 20 micro Pascals)		
	Frequent Events	Occasional Events	Infrequent Events	Frequent Events	Occasional Events	Infrequent Events
<b>Category 1:</b> Buildings where vibration would interfere with interior operations.	65 VdB*	65 VdB*	65 VdB*	N/A**	N/A**	N/A**
<b>Category 2:</b> Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
<b>Category 3:</b> Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB	40 dBA	43 dBA	48 dBA

## 1.5 Proprietary Design Deliverables

In addition to the requirements in Division 1, Section 1.8.5, the following sections describe the Design Deliverables required at each stage of the design specified in Division 1, Section 1.8.5.2.

### 1.5.1 50% Design Development

Principal Project Company shall prepare and submit the following in the 50% Design Development package:

1. Acoustic criteria per program space. Identify acoustically sensitive spaces.
2. Demonstrate compliance with acoustic criteria, including:
  - a. Background noise calculations for acoustically-sensitive program space types, providing proof of design compliance.
  - b. Verify compliance with prescriptive sound isolation and room acoustics criteria for acoustically-sensitive spaces.
3. Register of risks and critical path items in the Project design related to achievement of acoustic criteria, including recommendations for resolution of the same.
4. Detailed engineering analysis that meets the requirements of Section 1.7 (Special Commentary on Required Engineering Analysis) and demonstrates full compliance with vibration and structure-borne noise criteria.
5. Coordinated design to meet acoustics, noise, and vibration criteria with all related disciplines (architectural, structural, mechanical, etc.).

All noise control specifications that relate to these noise calculations shall be included in the written specifications for mechanical vibration and seismic control provided in a schedule in the Design Documents.

### 1.5.2 100% Design Development

Principal Project Company shall prepare and submit the following in the 100% Design Development package:

1. Updates to acoustic criteria per program space, identifying changes from the prior design deliverable.
2. Demonstrate compliance with acoustic criteria, including:
  - a. Background noise calculations for each program space type, providing proof of design compliance.
  - b. Sound isolation and room acoustics proof of design compliance for each category of acoustic privacy.
3. Register of risks and critical path items in the Project design related to airborne noise, including recommendations for resolution of the same.

4. Updates, if any, to detailed engineering analysis that meets the requirements of Section 1.7 (Special Commentary on Required Engineering Analysis) and demonstrates full compliance with vibration and structure-borne noise criteria.
5. Coordinated design to meet acoustics, noise, and vibration criteria with all related disciplines (architectural, structural, mechanical, etc.).

All noise control specifications that relate to these noise calculations shall be included in the written specifications for mechanical vibration and seismic control provided in a schedule in the Design Documents.

### **1.5.3 50% Construction Documents**

Principal Project Company shall prepare and submit the following in the 50% Construction Documents package:

1. Updates to acoustic criteria per program space, identifying changes from the prior design deliverable.
2. Proof of design compliance and detailed calculations, as necessary, with an executive summary that demonstrate compliance with airborne noise acoustic criteria.
3. Updates, if any, to detailed engineering analysis that meets the requirements of Section 1.7 (Special Commentary on Required Engineering Analysis) and demonstrates full compliance with vibration and structure-borne noise criteria.
4. Coordinated design to meet acoustics, noise, and vibration criteria with all related disciplines (architectural, structural, mechanical, etc.).

All noise control specifications that relate to these noise calculations shall be included in the written specifications for Mechanical Vibration and Seismic Control provided in a schedule in the Design Documents.

### **1.5.4 90% Construction Documents**

Prepare and submit the following in the 90% Construction Documents package:

1. Final acoustic criteria per program space.
2. Final summary documentation and detailed calculations, as necessary, demonstrating full compliance with criteria related to airborne noise.
3. Final detailed engineering analysis that meets the requirements of Section 1.7 (Special Commentary on Required Engineering Analysis) and proves full compliance with vibration and structure-borne noise criteria.
4. Final coordinated design to meet acoustics, noise, and vibration criteria with all related disciplines (architectural, structural, mechanical, etc.).

Include final noise control specifications that relate to these noise calculations in the written specifications for mechanical vibration and seismic control and/or provided in a schedule on the Project drawings.

## 1.5.5 Construction Administration

Confirm any changes to the Construction Documents made during construction remain compliant with the acoustics, noise, and vibration criteria.

Submit to the City a testing report with validating measurements demonstrating the acoustics, noise, and vibration criteria are met in all program spaces including:

- Background noise
- Speech privacy
- Structure-borne vibration
- Structure-borne noise

Perform testing based on available industry standards. Submit a request for information to the City for any clarification request related to testing requirements.

## 1.6 Special Commentary on Vibration Control Approaches

Excess vibration from the Infrastructure Facility may have an adverse effect on occupants of the Joint Development Alternatives. Given the high forces that can be imparted from some bus operations and maintenance equipment onto the building structure, the resulting vibration could travel through the building structure. If strong enough, this vibration can be re-radiated as audible noise and be felt in spaces, which can sometimes be quite far away from the source of vibration.

Based on the foregoing, the City's preferred hierarchy of methods for mitigating structure-borne vibration is in the order of precedence indicated as follows:

1. The preferred method is for the proposed building design to have decoupled structures between the Infrastructure Facility and the Joint Development Alternatives, with sufficient mass in demising constructions to also mitigate airborne noise to project criteria levels.
2. If a building design is proposed that does not entirely decouple the structures (per item 1 above), then acoustically-isolated architectural and/or structural systems shall be introduced where appropriate to meet the Project's vibration criteria.
3. Where neither decoupled structures nor acoustically-isolated systems are possible (per items 1 and 2 above, respectively), the mass of the demising constructions shall be capable of meeting the Project's vibration criteria.

## 1.7 Special Commentary on Required Engineering Analysis

In all design deliverables, engineering analysis shall demonstrate the Project's vibration criteria is met in the proposed building design. Minimum requirements for the analysis include the following:

1. Measurement and/or other documentation of noise and vibration levels for all equipment planned for the Bus Yard Component.
2. Conversion of the above into forcing functions representing each source.

3. Analysis showing that the source forcing functions do not cause exceedance of vibration and structure-borne noise criteria in the Joint Development Alternatives.
4. Error analysis and factor of safety shall be included.

Principal Project Company shall implement appropriate coordination with the Project's structural engineer to ensure that suitable assumptions regarding the stiffness and damping of floors are considered as part of the design parameters.

## 2 Seismic Resilience Performance Requirements

A high level of seismic resilience is required for the Project, both due to the SFMTA's role in emergency response and due to its interest in owning, operating, and maintaining a durable capital asset. Building codes aim for life safety but do not necessarily address resilience, which is the ability of a building to support its core functions quickly after an earthquake. Seismic resilience encompasses not just the structural performance of a building in an earthquake but also the performance of architectural, mechanical, electrical, plumbing, and other systems required to support those functions.

The seismic resilience requirements presented in this document draw on the recommendations from a 2009 report by the San Francisco-based think tank SPUR.<sup>1</sup> This report outlines desirable recovery scenarios for the San Francisco civic infrastructure following a major earthquake. Regarding the SFMTA transit system, the report recommends that "service [be] restored for 90 percent of MUNI customers" within 30 days of an "expected earthquake," which is defined as an earthquake event having 10% probability of occurrence in 50 years.

The SPUR report does not specifically address bus maintenance facilities such as the Project's Bus Yard Component. It is expected that buses themselves may be able to run immediately after such an earthquake, while the facilities that support transit operations might lose some functionality temporarily. However, functionality of such support facilities must soon be restored to maintain bus service. Hence it is judged that the Bus Yard Component facility should be operational within that 30-day period of the event if 90% of bus service is to be achieved.

Consistent with the SPUR report, these seismic criteria define functionality requirements for a seismic hazard level given by an earthquake event having 10% probability of occurrence in 50 years, otherwise known as a 475-year event. In these criteria this seismic level is termed the "design-level" event.

An additional structural performance target is defined for a much larger event known as the maximum considered earthquake ( $MCE_R$ ). This event may be expected to cause more damage and consequent loss of functionality. The California Building Code targets a maximum 10% probability of collapse in the  $MCE_R$  event for most buildings. A higher level of performance in the  $MCE_R$  is not necessary for the Facility. However, these seismic criteria do specify that the

---

<sup>1</sup> San Francisco Bay Area Planning and Urban Research Association (SPUR), "Lifelines: Upgrading Infrastructure to Enhance San Francisco's Earthquake Resilience," [https://www.spur.org/sites/default/files/publications\\_pdfs/SPUR\\_Lifelines.pdf](https://www.spur.org/sites/default/files/publications_pdfs/SPUR_Lifelines.pdf)

MCE<sub>R</sub> performance be explicitly checked, which is not otherwise required by the code. This provides additional confidence that the intended performance will be attained.

These resilience goals apply specifically to the Infrastructure Facility, but the design of the Joint Development Alternatives must consider the impacts of their performance on transit operations following a large earthquake. Structurally, the Joint Development Alternatives must meet the same performance level as the Infrastructure Facility. However, these performance requirements do not address utilities that only serve the Joint Development Alternatives and whose repair would not impede operation of the transit portion of the Project.

It is possible that the Infrastructure Facility and Joint Development Alternatives could be developed in separate phases. All the requirements and deliverables discussed herein that are related to seismic resilience are applicable in all cases or scenarios for future development, whether in phases or otherwise, and including any interim conditions in between phases.

It is the responsibility of the Principal Project Company to:

- Clearly define phases of development, if any, and the Project scope(s) to be implemented in each phase; and,
- Develop the design and engineering analyses that demonstrate compliance with the seismic resilience criteria set forth herein for each and every phase of the Project's development.

The above objectives are translated into specific requirements in the following sections. The resilience standard for this Project exceeds the code design standard in many areas; however, it should be noted that this resilience standard does not replace full compliance with the governing building code.

## 2.1 Resilience Requirements

The Project's resilience requirements are stated qualitatively as follows in terms of expected performance at two levels of seismic hazard:

1. Immediate re-occupancy of the Infrastructure Facility after the design-level event ("green tag" expected)
2. Recovery of essential functionality of the Infrastructure Facility within 30 days after the design-level event
3. Maximum 10% probability of collapse of the Project in an MCE<sub>R</sub> seismic event

The required approach to attaining these requirements is described in greater detail in the following sections. The seismic hazard levels are defined in Section 2.3 (*Seismic Hazard Definition*).

## 2.2 Compliance Standard

These seismic resilience requirements adopt the system outlined by the Resilience-based Earthquake Design Initiative (REDi). A copy of this standard can be downloaded free of charge.<sup>2</sup> Other systems of equivalent intent and approach may be used upon review and approval by the City.

In keeping with the resilience requirements stated in Section 2.1 (*Resilience Requirements*) above, the Project's resilience requirements are as required for REDi Gold Level, except as modified in this document.

## 2.3 Seismic Hazard Definition

The design-level earthquake is represented by an elastic acceleration response spectrum having 10% probability of exceedance in a 50-year period (475-year return period) based on a site-specific probabilistic seismic hazard analysis (PSHA). The  $MCE_R$  event shall be as defined by the California Building Code and its referenced standard ASCE 7, having a site-specific PSHA response spectrum with deterministic cap. The spectra shall incorporate damping as appropriate for the type of structure to be designed and the level of damage expected under the two hazard levels.

In order to accommodate any phasing of the permitting and construction of the Facility (for example, with the Infrastructure Facility delivered first and the Joint Development Alternatives delivered at a later date, after completion of the Infrastructure Facility), the  $MCE_R$  ground motions for all scenarios defined in Section 2.8 (*Consideration of Joint Development Alternative Scenarios*) used for the purpose of resilience verification shall be determined according to one of following options:

1. The  $MCE_R$  response spectrum shall be developed from an envelope across all periods of the  $MCE_R$  spectra defined by ASCE 7-16 and ASCE 7-22 for the given site class. A suite of ground motions shall be developed according to ASCE 7 and amplitude-scaled or spectrally matched to the envelope  $MCE_R$  response spectrum.
2. A suite of ground motions shall be developed according to ASCE 7 and amplitude-scaled or spectrally matched to the ASCE 7-16  $MCE_R$  response spectrum. The suite shall be then amplitude-scaled by a scalar equal to the average ratio between ASCE 7-22  $MCE_R$  response spectra and ASCE 7-16  $MCE_R$  response spectra within target period range. This scale factor shall not be lower than a ratio between the spectral ordinate of ASCE 7-22  $MCE_R$  response spectra and ASCE 7-16  $MCE_R$  response spectra at the period of the elastic mode which captures the largest percentage of the Infrastructure Facility mass. The average of the suite of ground motion response spectra shall not fall below 90% of ASCE 7-22  $MCE_R$  response spectrum for any period within the target period range relevant to the seismic system.
3. The Facility shall be analyzed using a suite of ground motions developed according to ASCE 7 and amplitude-scaled or spectrally matched to ASCE 7-16  $MCE_R$  response spectra. The structural performance of the Facility shall be Life Safety according to ASCE 41.

---

<sup>2</sup> Arup, "REDi Rating System: Resilience-based Earthquake Design Initiative for the Next Generation of Buildings," Version 1.0, October 2013, <https://www.arup.com/perspectives/publications/research/section/redi-rating-system>

4. Any other rational approach of equivalent intent may be used upon review and approval by the City.

The design-level earthquake spectrum as defined by the California Building Code may not match the PSHA for all building periods at this site. The code-specified seismic hazard shall be utilized for confirming compliance with all code requirements. For evaluating structural and non-structural performance according to Section 2.5 (*Structural and Non-Structural Performance Requirements*), as well as for loss and downtime assessments according to Section 2.6 (*Loss and Downtime Assessment*), the PSHA shall be used in lieu of the code spectrum.

A structure designed solely according to code requirements will likely not meet the resilience requirements under the PSHA hazard. Therefore, the design team shall check these requirements at various stages of the design to ensure that appropriate decisions are made in a timely manner.

## 2.4 Structural Analysis Method

Principal Project Company shall conduct a nonlinear response history analysis (NLRHA) to validate compliance with the Project's resilience requirements. This analysis involves developing a detailed digital model of the Project's structural system and simulating the building's response to earthquake ground motions ("time history records") that have been selected specifically to match salient characteristics of the Project Site and nearby source faults.

Deliverables and their timeline are set forth in Section 2.8 (*Timeline of Deliverables*). Structural response parameters required by Section 2.5 (*Structural and Non-Structural Performance Requirements*) and Section 2.6 (*Loss and Downtime Assessment*) shall be obtained from such analysis, which shall be conducted at both the design-level earthquake hazard and the MCE hazard as applicable.

Time history records shall comply with ASCE 7 provisions. For this analysis, expected material properties may be used where appropriate and as defined in ASCE 41. Nonlinear analysis guidelines given by NIST GCR 17-917-45, "Recommended Modeling Parameters and Acceptance Criteria for Nonlinear Analysis in Support of Seismic Evaluation, Retrofit, and Design," are considered acceptable.

NLRHA need not be used for calculations to validate code compliance, unless required by the code.

## 2.5 Structural and Non-Structural Performance Requirements

The structural system of the Infrastructure Facility shall meet immediate occupancy performance as defined by ASCE 41 subject to the design earthquake. This performance level shall be deemed to satisfy the requirement of Section 2.2.4 of the REDi standard referenced above.

The structural system of the Infrastructure Facility shall additionally meet collapse prevention performance as defined by ASCE 41 subject to the MCE<sub>R</sub> hazard, unless life safety performance is required by Option 3 of Section 2.3 (*Seismic Hazard Definition*).

Non-structural performance for components necessary to the operations of the Infrastructure Facility shall meet, as a minimum, the operational nonstructural performance level as defined by ASCE 41 subject to the design-level earthquake, but not less than any code requirements. Compliance with this requirement shall be confirmed using mean accelerations and displacements derived from response history analysis.

Additionally, equipment required to be operational for resumption of the Infrastructure Facility's transit functions (as defined in Section 2.6 (Loss and Downtime Assessment)) shall be seismically certified according to the requirements specified in ASCE 7-22 Section 13.2.6. Other alternatives to seismic certification that can be confirmed to support functionality within the required recovery period may be used upon review and approval by the City.

## 2.6 Loss and Downtime Assessment

Principal Project Company shall conduct a downtime assessment as described in Section 4.3 of the REDi standard (referenced above) to confirm that the Project's requirement for post-earthquake recovery is met. The methods, assumptions and results of this assessment shall be documented in a written report as indicated in Section 2.8 (Timeline of Deliverables). This assessment shall utilize building response parameters extracted from the response history analysis at the 475-year hazard. The results corresponding to the 75% confidence level shall be used.

The direct financial loss assessment described in Section 4.2 of the REDi standard may be omitted. This assessment may, but need not, utilize the PACT software which is mentioned in the REDi standard.

For this analysis, functional recovery shall be achieved when the following systems are functional:

1. For the entire Facility:
  - a. Fire protection systems and fire-rated barriers
  - b. Sanitary sewer and storm drain systems
2. For the Infrastructure Facility (including consideration of the impacts of the Joint Development Alternatives on the Infrastructure Facility):
  - a. Power and lighting systems
  - b. Domestic hot and cold water systems
  - c. Bus maintenance equipment
  - d. Access controls systems
  - e. Security systems

In order to meet the REDi Gold standard, only aesthetic damage to the above systems shall be permissible immediately after the design earthquake, unless Principal Project Company can demonstrate that a given component in the above systems can be easily and readily replaced to achieve the same functional recovery criterion.

In January 2020, a City ordinance banned the use of natural gas in new construction. In addition, in the event of a large earthquake the City's existing supply of natural gas will very likely be disrupted for a period of time that is greater than the Project's required functional recovery time. For both of these reasons natural gas will not be permitted for the Project's systems which provide the above essential functions.

## 2.7 Seismic Resilience Peer Review

The City will retain a seismic resilience peer review consultant to perform the following scope of work:

1. Review of basis of design document, which shall include design criteria for structural and non-structural components
2. Review of structural analysis model assumptions and methods
3. Review of seismic hazard and ground motions used for analysis
4. Review of downtime assessments
5. General review of seismic system and non-structural detailing

The peer reviewer will be periodically engaged by the City to confirm design intent is being met. Principal Project Company shall prepare and submit deliverables, as described in Section 2.9 (*Deliverables and Timeline for Seismic Resilience Peer Review*), to the City for review and approval.

The Principal Project Company shall support the peer review process (e.g., by working with the peer review team and incorporating their comments) and incorporate the appropriate peer review check points into the PA Term.

The seismic resilience peer review does not replace any code mandated structural peer review.

## 2.8 Consideration of Joint Development Alternative Scenarios

The Infrastructure Facility and Joint Development Alternatives may be developed in separate phases. refer to Division 1 for the Project Description, and Division 3 (*Design Criteria Document*), including Appendix G (*Design Criteria Para-Transit*).

There are two Joint Development Alternatives – a Housing and Commercial Component adjacent to and atop the Infrastructure Facility, and a Paratransit Component atop the Infrastructure Facility.

Principal Project Company shall accommodate, at a minimum the following three Joint Development Alternative scenarios with respect to the use of the roof of the Infrastructure Facility. In all cases, the design of the Infrastructure Facility shall achieve the seismic resilience requirements set forth herein under any of the three alternative use scenarios.

All the applicable Technical Requirements for the Infrastructure Facility will apply to the Paratransit Facility if built.

The Joint Development Alternative scenarios are, as a minimum, defined in Table 1 as follows. Components of the Housing and Commercial Component Alternative planned to be built on the roof of the Infrastructure Facility are referred to as “Podium Roof HCC”.

**Table 1:** Requirements for alternative use scenarios for the roof of the Infrastructure Facility (in addition to those specified elsewhere in the Technical Requirements)

Joint Development Alternative Scenarios	Structural design requirements for the Infrastructure Facility (in addition to those specified elsewhere in these Technical Requirements)	Bus Yard Component operational continuity requirements (in addition to those specified elsewhere in these Technical Requirements)
1. Podium Roof HCC built after start of operation of the Infrastructure Facility	<ul style="list-style-type: none"> <li>• Design to support temporary construction loadings associated with at least one feasible method to realize the future construction of the Podium Roof HCC. Principal Project Company shall submit the temporary construction loading plan for SFMTA review and concurrence.</li> </ul>	<ul style="list-style-type: none"> <li>• Any modifications to the Infrastructure Facility required to accommodate the Podium Roof HCC shall be capable of being constructed without interrupting or disrupting operations in the Infrastructure Facility</li> </ul>
2. Paratransit Component built after start of operation of the Infrastructure Facility (see Appendix G of Division 3 of the Technical Requirements)	<ul style="list-style-type: none"> <li>• Design the roof level using the same live loads, programming requirements for superimposed dead and live loads (unless programming is updated), and structural performance requirements as for the bus maintenance and parking levels within the Infrastructure Facility (defined in Division 3 of the Technical Requirements)</li> <li>• Accommodate extension of the Bus Yard Component’s scissor bus ramp system to access the roof of the Infrastructure Facility</li> <li>• Design to support temporary construction loadings associated with at least one feasible method to realize the future construction of the Paratransit Component. The Principal Project Company shall submit the temporary construction loading plan for SFMTA review and concurrence.</li> <li>• Design the Infrastructure Facility roof to support a photovoltaic solar panel array</li> </ul>	<ul style="list-style-type: none"> <li>• Any modifications to the Infrastructure Facility required to accommodate the Paratransit Component shall be capable of being constructed in such a way as to <b>completely avoid</b>:                             <ul style="list-style-type: none"> <li>○ Interruption or disruption of operations in the Infrastructure Facility, except for Bus Yard Component Level 4 which shall not be interrupted for more than [30 days]</li> <li>○ Relocation or reconstruction of any facilities, rooms, equipment, and/or building systems necessary for operations in the Infrastructure Facility, unless expressly agreed by the City</li> </ul> </li> <li>• The Principal Project Company shall work with the SFMTA to further minimize the length of time and physical extent of any interruptions or disruptions to Bus Yard Component operations on Level 4</li> </ul>
3. No occupied use of the roof of the Infrastructure Facility (whether a temporary or permanent condition)	<ul style="list-style-type: none"> <li>• Verify that the seismic resilience requirements of Section 2.1 through 2.7 are met for the Infrastructure Facility in the absence of any other structure on top</li> <li>• The Infrastructure Facility roof shall be able to support a photovoltaic solar panel array</li> </ul>	

## 2.9 Deliverables and Timeline for Seismic Resilience Peer Review

Deliverable	Design Stage	Seismic Resilience Peer Review Actions
Structural drawings showing all sizes and connection details for elements of the primary seismic force resisting system	50% DD	Confirmation that design meets design criteria.
<p>Final Basis of Design Documents including final NLRHA results, and downtime assessment report. This shall include check of all Joint Deliverable Alternative scenarios, per the requirements of <u>Section 2.8</u> (<i>Consideration of Joint Development Alternative Scenarios</i>).</p> <p>Seismic Certification Plan. This plan shall include, for each nonstructural component required for essential functionality, the following information:</p> <ul style="list-style-type: none"> <li>• Required testing procedure including project specific testing plan, or</li> <li>• approvals based on past test results such as HCAI OSP or similar, or</li> <li>• Alternative approach with confirmation that the component will be operational within the required recovery time.</li> </ul> <p>The Seismic Certification Plan shall include a feasible timeline for carrying out the planned procedures that is compatible with the overall Project schedule.</p>	100% DD	<p>Confirmation that basis of design meets design criteria, and that sufficient NLRHA and downtime assessment results are presented to validate required performance.</p> <p>Confirmation that the Seismic Certification Plan meets the intent of the resilience standard.</p>
<p>Structural Drawings showing final configuration and sizing of seismic force resisting system and related details.</p> <p>Final Seismic Certification Plan, including any revisions to the 100% DD document and the status of planned testing.</p>	90% CD	Confirmation that no changes are made from the 100%DD structure/resolved peer review, including the Seismic Certification Plan, that materially alter the agreed design intent, unless accompanied by a new validation package (as required and specified above at the 100% DD stage).

# 1. INTRODUCTION

This Division 5 includes the Technical Requirements and planning criteria to enable a future transition of the Project's Bus Yard Component from supporting electric trolley buses (ETB) to supporting battery electric buses (BEB) while maintaining operational flexibility and minimizing disruptions.

The City's current fleet management strategy is to open the Project with a 100% ETB fleet and operate those initial vehicles through their useful lifetimes before potentially beginning the BEB transition at the City's discretion. This places the potential initial deployment of BEBs likely to begin no sooner than 2040.

The Technical Requirements for the BEB Charging Equipment solution and the associated electrical feed requirements described herein (refer to [Section 2.2](#) and Exhibit B) provide the minimum design requirements for the potential, future deployment of BEB to be served by the BEB Charging Infrastructure.

Principal Project Company shall design and construct the BEB Charging Infrastructure per the requirements in this Division 5. This includes but is not limited to the designed and maintained space for electrical distribution from the existing and future electrical feeds to the BEB Charging Equipment and charging positions, design and installation of wireways and raceways in the bus parking areas to allow for seamless transition to BEBs upon the staged transition from the overhead catenary system, and the Project to fully support the operational requirements of the detailed charging system below upon the City's direction to deploy the system at a date of their choosing.

As further detailed in [Section 2.2](#) of this Division 5, two electrical utility feeds are projected to serve the Infrastructure Facility upon the transition and deployment to BEB. The initial feed, for mixed-use service is indicated on WDT application as feeder 2, shall be in place at the time of Substantial Completion and will serve the needs of the entire Infrastructure Facility and all building functions except for the final one hundred twenty-eight BEB charging positions required for the ultimate BEB fleet projected.

The second feed, for BEB charging service is indicated on WDT application as feeder 1, may not be energized at the Project Site upon Substantial Completion, but Principal Project Company shall provide all of the space, building systems, conduit pathways, penetrations, wireways, raceways, and all other considerations necessary to enable distribution into, throughout, and within the Infrastructure Facility to facilitate its operation upon implementation and connection of this feeder 1.

This Division 5 contains detailed information on the City's BEB conversion planning and describes:

1. Envisioned implementation of BEB support infrastructure in the City's bus facilities in general, and in multi-level bus facilities in particular.
2. Specific approach to BEB improvements for this Project, including fleet conversion plans, and site-specific information that will assist Principal Project Company to deliver the City's vision during the Term.

For the purposes of designing the Infrastructure Facility and developing cost, schedule, and risk analyses, and during the Term, the Principal Project Company shall adhere to the following definitions and categories:

- **BEB Charging Infrastructure:** means the necessary layout space and clearances for future switchgear, power distribution systems (including any required feeders), housekeeping pads, housings, integrated structural components, space for mounting solution(s), and associated wire ways, conduit, and cable trays; space and penetrations for the required routing layout to support the future charging system's associated IT cabling (whether fiber optic or of other types), as set forth in Division 5 of the Technical Requirements.

Regardless of the design approach, the Charging Infrastructure shall include all Infrastructure Facility improvements installed upon Substantial Completion that enable the future deployment of BEBs and the proposed Charging Equipment detailed in this Division 5 without invasive or destructive measures needed to do so. The design of the facility structure shall adequately account for the weight requirements of the proposed future charging and electrical equipment. There shall be no major additional capital improvements needed to run the BEB system, unless agreed to and approved by the City, in its sole discretion to install those BEB Charging Infrastructure equipment and electrical distribution systems mentioned above. Charging Infrastructure feeds and supports the Charging Equipment, as described in the next item in addition to the BEB Emergency Power requirements defined in Section 2.3.

- **BEB Charging Equipment:** means the future overhead inverted pantographs, charging cabinets, dispensers, switchgear and associated wire ways, conduit, and cable trays that provide the point-to-point contact where individual BEBs connect to the overall charging system.

The BEB Charging Equipment must be capable of being connected to the BEB Charging Infrastructure to enable charging of a BEB fleet according to the performance requirements defined in this document and according to the City's BEB fleet growth plans. The BEB Charging Equipment shall include the charge management/operations software solution (including the Electric Vehicle Charge Management System) to enable the Infrastructure Facility to successfully operate a BEB fleet, meeting the requirements set forth by the City at the time of their future BEB deployment. The inclusion of BEB Charging Equipment in this Agreement is expressly excluded, and its inclusion shall be contingent upon the City's sole discretion to determine future scope.

The interface point between the BEB Charging Infrastructure and the BEB Charging Equipment shall be the termination point of all wire ways, conduit, and/or cable trays to the charging cabinets or future location of charging cabinets.

## 1.1. Background

Per the California Air Resources Board's Innovative Clean Transit regulations, the City must convert to a zero-emission bus fleet by 2040. To enable this transition, the City drafted a Zero Emission Facility and Fleet Master Plan (Zero-Emission Plan) through a partnership with WSP USA, Inc. The Zero-Emission Plan provides a roadmap for the City's successful facility and infrastructure transition and upgrade, and will position the City to put these capital projects forward for capital funding that may become available in the future for BEB facility projects.

The City currently operates the largest fleet of zero emission ETBs in North America. The City plans to transition all routes that are currently served by diesel/hybrid buses fully with BEBs; this move requires converting all of the City's existing bus maintenance facilities into facilities capable of charging, maintaining, and operating these vehicles.

The requirements in this Division 5 are based on current information available to the City and may be updated by the City from time to time.

As part of the City 's goal to achieve a 100% zero-emission fleet by 2040, the City will begin the large-scale procurement of BEBs in or around 2025.

Through the Zero-Emission Plan, the City is carefully charting a schedule for the adoption of new vehicles, gradual retirement of existing coaches, overhaul of existing facilities, and integration of BEB Charging Infrastructure.

## **1.2. 2021 SFMTA 40-Foot BEB Pilot Program**

Since 2021, the City has been conducting a pilot program to evaluate the performance, reliability, operability, and maintainability of the 40-ft BEBs that are currently available on the market, and to gain experience with BEB Charging Infrastructure to prepare for future fleetwide adoption (the "2021 40-ft Pilot"). The City anticipates the conclusion of this pilot program in mid-2024.

The City expects that the 2021 40-ft Pilot will provide valuable insight into the state of the BEB market and that the conclusion of the 2021 40-ft Pilot will pave the way for successful adoption of 40-ft BEB as part of the City 's future BEB procurement strategy.

The City is in the preliminary stages of implementing a 60-ft BEB pilot to evaluate the feasibility of those vehicles in the City 's operating environment; bus procurement for this pilot program is scheduled to begin in 2025.

As part of the 2021 40-ft Pilot, the City procured three 40-ft BEBs each (total of nine) from New Flyer, BYD, and Proterra, and one 40-ft BEB from Nova in summer 2021, with two additional Nova Bus 40-ft BEBs scheduled to be delivered by the end of 2023. These buses will be tested in regular revenue service in San Francisco for a period of 18 months. Upon the conclusion of the 2021 40-ft Pilot, the City will develop guidance on the following topics:

1. Which existing 40-ft BEB models can meet the City 's service requirements.
2. The routes and service roles, if any, that cannot be serviced by BEBs.
3. The maintenance requirements and practices for a BEB fleet.
4. The replacement ratio that will be required when transitioning from diesel hybrid buses and trolley buses to BEBs.
5. Which specifications and requirements (battery capacity, ground clearance, telematics systems, etc.) will be kept or modified for future full-scale procurements.
6. The charging methodology and operating profile required for sustained operation of BEBs in full-scale deployment.
7. Optimum bus yard storage and yard management practices.

## 2. BEBS AT POTRERO YARD

Potrero Yard currently houses 146 trolley buses: 53 40-ft buses and 93-60ft buses.

If and when the City directs the transition to BEBs in the future, the Infrastructure Facility shall accommodate the vehicle size and type specified in Exhibit A (Battery-Electric Bus Specification) of this Division 5 at a minimum. The BEB fleet shall be parked in a contiguous area in the Infrastructure Facility’s allocated bus parking layout, unless agreed to and approved by the City, in its sole discretion.

**Table 1** shows the capacity and fleet size allocation for the Project upon Substantial Completion. **Table 2** below shows the total planned capacity for the Project after the Infrastructure Facility is fully transitioned to BEBs.

Moving from the fleet capacities shown in **Table 1** to those in **Table 2** will require the City to perform off-site fleet management to move some 40-ft vehicles offsite, over time, to accommodate more 60-ft vehicles at Potrero Yard. It will also require modifications to the location of the overhead BEB charging equipment to serve the fleet in use at a given time.

Table 1: Potrero Bus Fleet Capacity upon Substantial Completion of the Infrastructure Facility

Location	BEBs		ETBs		Total Buses
	40'	60'	40'	60'	
Potrero Bus Yard	0	0	138	93	231

Table 2: Potrero Bus Fleet Capacity After Fully Transitioning to BEBs (no sooner than 2040)

Location	BEBs		ETBs		Total Buses
	40'	60'	40'	60'	
Potrero Bus Yard	53	160	0	0	213

### 2.1. BEB Power Supply Approach

The Facility shall be designed to support the operation BEBs using an optimized charging strategy. This strategy will integrate data from vehicle battery charge and depletion, the bus telematic system, and revenue route planning with available utility and power information at a minimum upon City’s direction to transition to BEBs. The optimized charging strategy requirements to meet this operational criteria will be further defined by the City upon their decision to begin the ETB to BEB transition process at the Potrero Yard.

Due to the timeline required for the electrical service applications and system studies, the City has submitted two applications for electrical service to the San Francisco Public Utilities Commission, which serves as intermediary for City departments for all communications concerning Hetch Hetchy Power with PG&E.

Electrical services requests may be re-evaluated for initial deployment and space provisions in Infrastructure Facility design considered for additional feeds and switchgear closer to commencement of the ETB to BEB transition (currently proposed to begin no sooner than 2040).

These applications have requested the full electrical load that has been estimated by the City to be required to operate the ultimate total anticipated 213 BEBs on an optimized charging strategy. This estimate is based off the ultimate BEB fleet projected to be operated from Potrero Yard after the completion of a transition from ETBs. This transition is projected to begin no sooner than 2040 and the associated load requirements may be re-evaluated between 2035 and 2038 to plan for 2040 deployment timeframe.

Per the applications for electrical service, the power supply for BEB's is expected to be split across two feeders upon its deployment to allow for immediate redundancy.

The City has been advised by the SFPUC that the maximum service request per application is 10 MW.

## **2.2. BEB Power and Infrastructure Performance Requirements**

During the Term, Principal Project Company shall prosecute and manage the ongoing electrical service applications and continue working with the SFPUC and PG&E toward a resolution of the engineering design and construction challenges, the cost, and the schedule to bring the requested electrical service to the Infrastructure Facility.

At Substantial Completion, the Facility's electrical room and all necessary electrical equipment, appurtenances, and provisions shall include a microgrid controller compatible to accommodate the BEB program at full build-out. Additionally, the Infrastructure Facility shall be capable of accommodating the full BEB program based on an optimized charging strategy, and shall adhere to the following requirements:

1. The Infrastructure Facility shall be equipped with all the BEB Charging Infrastructure to accept the future deployment of BEB Charging Equipment required to operate the full programmed fleet of 213 BEBs .
2. The BEB Charging Infrastructure shall be ready to connect to all future placement of additional BEB Charging Equipment in such a way to ensure minimal intrusion and disruption to transit operational continuity at the time of installation and connection of the future placement of all BEB Charging Equipment required to transition the facility from ETBs to BEBs.
3. The mounting provisions for the ETB OCS parking spaces shall be designed to ensure a seamless transition from ETB parking spaces to BEB parking spaces.

Principal Project Company shall ensure that adequate space is planned for and created in the Infrastructure Facility so that the future BEB Charging Equipment can be installed, operated and seamlessly integrated with the Charging Infrastructure without modification to the Infrastructure Facility.

The technical specifications that are the basis of design for the future deployment of BEBs at the site, along with select design modules of the BEB Charging Equipment, are attached as Exhibit B, C, and D to this Division 5. The BEB Charging Infrastructure design in Exhibit D (*Conceptual Design Module Package*) is a proof of concept for one approach to deploying the BEB Charging Equipment layout and technology. It is neither prescriptive nor restrictive, allowing for the development of alternative charging approaches, equipment layouts, required power analyses, or other physical arrangements and charging technologies. Refer also to general notes in Exhibit D for additional context.

The following are the basic technical requirements for the BEB Charging Equipment to be supported by the BEB Charging Infrastructure. Additional requirements may be developed during the Term.

- All charging shall be done within the Infrastructure Facility.
- Overhead DC inverted pantograph chargers shall be utilized for all bus parking spaces.
- Plug-in DC charging systems shall be programmed for all preventive maintenance bays that require overhead charging for the trolley bus configurations. These plug-in DC charging dispensers shall be installed at the rear left side of the maintenance bays with charging cable stored on a cable reel.
- All overhead in-yard charging systems shall be capable of providing a minimum charging level of 150 kW, and safely recharge 40-ft BEB energy storage system (ESS) from 10% state of charge (SOC) usable in vehicle to 90% SOC usable in vehicle in less than four (4) hours.
- All plug-in DC charging systems shall provide a minimum charging level of 50 kW, and safely recharge 40-ft BEB ESS from 10% SOC usable in vehicle to 90% SOC usable in vehicle in less than ten (10) hours.
- Plug-in charging systems shall utilize a concurrent charging enabled charger to energize multiple connected dispensers at once.
- The maximum charging cabinet to plug-in dispenser ratio is 4:1, so long as DC/communications 300-foot limit is maintained, and all other Technical Requirements are achieved.

While still meeting the number of maintenance bays required in Division 3 of the Technical Requirements, Principal Project Company shall evaluate and, if space in the bus parking area allows, provide an additional 18" width on the left side of each preventive maintenance bay equipped with plug-in charging systems to allow for safe staff movement around a BEB connected to a plug-in charge connector without interfering with the charge connector or port door.

The charging system shall be compatible, at a minimum, with the following long-range e-bus manufacturers:

1. Proterra
2. New Flyer
3. BYD
4. Nova Bus
5. Gillig

The BEB infrastructure industry is rapidly developing and innovating. Accordingly, the criteria described in Exhibits B and C are set forth as minimum standards and technical requirements.

### **2.3. BEB Emergency Backup Power Requirements**

PG&E reliability data from 2006 to 2015 show that there is an average of one power outage every two years. On average, a power outage in the San Francisco service environment lasts 78 minutes before service is restored. In recent years, power outages have been intentionally implemented by Northern California utility companies in anticipation of wildfires during summer months, which may increase outage length and frequency in future years.

As the City converts its fleet to BEB's, the fleet becomes heavily dependent on electrical utility partners and the resiliency of the SFPUC's and PG&E's electrical infrastructure. In the event of large-scale, sustained electrical outage, the BEB fleet would not have the ability to operate. The City is seeking cost-efficient methods of achieving electrical redundancy to continue providing service and emergency response functions.

The City's first layer of redundancy is in the electrical service applications, where the City has split the BEB fleet electrical loads into two separate applications. As such, two feeders will enter the site, allowing a portion of the fleet to be powered in the event one feeder is out of service. These applications, the City will also investigate the potential for the two feeders to be fed by two separate PG&E substations, which will add to the resiliency of the fleet.

Currently, the City is not considering procuring a completely redundant power supply from the SFPUC and PG&E (e.g., doubling the facility and BEB electrical requirement) due to cost.

However, the City wants built-in redundancy to power a portion of the BEB fleet once deployed, at City's discretion.

The following redundancy requirements shall be included in the Charging Infrastructure:

1. In addition to the emergency backup power requirements, 20% of the Potrero Division's fleet (approximately 43 vehicles) shall be connected to a redundant power supply, subject to applicable codes. This backup power requirement must fully charge 20% of the fleet vehicles in under 9 hours.
2. To the extent feasible, this backup power shall be provided by on-site renewable sources (e.g., photovoltaic panel and battery storage system) that are not dependent on fossil fuels.
3. To prepare for future needs, space shall be allocated for three energy storage system (ESS) battery packs, each approximately 10 feet by 40 feet (with clearances to be confirmed in the applicable code).
4. Space is available to serve the future resiliency solution when the BEB transition begins.
5. An emergency operations plan describing how the emergency fleet would function based on the Infrastructure Facility's backup power design.

Principal Project Company shall also consider the long-term role the City's proprietary DC traction power system could play in backup power, once the Facility transitions fully to BEB.

#### **2.4. Reference Design Concept Figures Related to BEBs**

This Division 5 includes a sample design solution for accommodating the required BEB Charging Infrastructure. The sample design includes an overhead gantry to mount pantographs and charging cabinets.

The City encourages creativity and innovation in the design of the BEB Charging Infrastructure to support the future deployment of the BEB Charging Equipment. While Principal Project Company shall comply with the minimum standards outlined in Section 2 (BEB's at Potrero Yard), they have flexibility to determine the spatial design approach.

## **2.5. Requirements for Facility Conversion Phasing**

Upon the City's start of the transition from ETBs to BEBs, 60-ft trolley buses are expected to be replaced with BEBs. The City requires that:

1. During Term, Principal Project Company shall work with the City to plan for the transition, including adapting to any changes that the City may need to implement to its fleet transition plan, and design the Facility to accommodate the opening day requirements with optimal flexibility.
2. Principal Project Company shall implement those plans and continue to work with the City to prepare for its fleet transition.

For the BEB transition, the City requires that:

1. The transition shall occur in phases, preferably one bus parking lane at a time to align with the procurement schedule of the BEB's
2. The OCS for the ETBs shall be replaced with the overhead Charging Equipment required for the BEBs.
3. Future BEB Charging Equipment shall seamlessly integrate with each prior phase's existing Charging Equipment and Charging Infrastructure and shall be backwards-compatible with existing BEBs.
4. Future BEB Charging Equipment shall be incorporated in the Infrastructure Facility's management solution upon activation/commissioning of the BEB Charging Equipment and any modifications to the BEB Charging Infrastructure.

### 3. EXHIBIT A: BATTERY-ELECTRIC BUS SPECIFICATIONS

**Table 3** as follows provides an example description of the potential fleet vehicle the City is likely to pursue upon transition to BEBs. The below general dimensions exclude exterior mirrors, marker and signal lights, flexible portions of the bumpers, and fender skirts.

Table 3: Coach Requirements

Item	40' E-bus	60' E-bus
Length, excluding bumpers	41' +/- 2'	60' +/- 2'
Width – exterior, excluding mirrors	102" max	102" max
Height Overall, without roof-mounted HVAC system	134" max	134" max
Height Overall, with roof-mounted HVAC system	140" max	140" max
Front Door Height from Ground (normal)	15.5" max	15.5" max
Front Door Height from Ground (kneeled)	13" max	13" max
Rear Door Height from Ground (normal)	17.5" max	17.5" max
Body Ground Clearance	8" min	8" min
Approach Angle with/without Over-raise Feature	9 degrees min	9 degrees min
Break over Angle with/without Over-raise Feature	8.9 degrees min	8.9 degrees min
Departure Angle with/without Over-raise Feature	9 degrees min	9 degrees min
Turning Radius (Outside Body Corners)	45 feet max.	45 feet max.
Axle Zone Clearance	5" min	5" min

BEBs will be equipped with overhead chargers compliant with SAE J3105 (ISO 15118 and IEC 61851 Parts 1 and 23). The center of the overhead charging rails shall be installed above the center of the front door of the coach.

Any charging system used shall be capable of 2-way communication with the Bus ESS and battery management system (BMS). The charge management/operations software solution shall include the following protections and driver alerts: (i) dynamic state of charge of the energy storage system, and (ii) charge rate. Both the bus and charger systems shall be capable of independently commanding an emergency stop of the recharge cycle should a critical fault occur. The City requires a contact style charging interface (SAE J1772 CCS Type 1) to be provided on the rear of the coach on both streetside and curbside.

**4. DIVISION 05 - EXHIBIT B: BASIS OF DESIGN – SECTION 11 11 36.14  
COMMERCIAL ELECTRIC VEHICLE CHARGING UNIT FOR TRANSIT  
DEPOTS**

The following design specifications and conceptual design modules for the BEB Charging Equipment provide the minimum requirements for sizing the BEB Charging Infrastructure, operational requirements, and minimum spatial needs of the proposed BEB Charging Equipment which shall be installed at a later date upon City's sole discretion and supported by the BEB Charging Infrastructure in place at Substantial Completion.

Note that any references to submittals in the following indicative design specifications are provided as guidance only and are not required to be adhered to as part of the Project.

## SECTION 11 11 36.14

### COMMERCIAL ELECTRIC VEHICLE CHARGING UNIT FOR TRANSIT DEPOTS

#### PART 1 - GENERAL

##### 1.1 WORK INCLUDED

- A. Guide specification of equipment items as listed below by Equipment Mark Number are provided to establish minimum performance requirements, operational criteria, and standards compliance of a DC charging system for commercial battery electric vehicles charged via automated connection to overhead charging rail on vehicle roof and by handheld manually inserted plug. Alternative systems that comply with these minimum performance requirements, operational criteria and standards compliance but are achieved by physically different equipment configurations than the guide layout and the components listed but achieve the same verifiable results will be considered and reviewed by the City as equivalents. DC overhead charging system to consist of:
1. CHARGING CABINET, BATTERY ELECTRIC BUS, 150kw DC POWER Equipment Mark Number: 8012
  2. CHARGING PANTOGRAPH, INVERSE, FACILITY MOUNTED Equipment Mark Number: 8020
  3. REMOTE PLUG-IN DISPENSER Equipment Mark Number: 8025
- B. Installation of equipment with labor, services, and incidentals necessary for complete and operational equipment installation.
- C. Utilities to be roughed in at location recommended by manufacturer.
- D. Coordination of equipment and vehicle to allow for automated operation and communication of the Charging Pantograph, Inverse, Facility Mounted, Equipment Mark Number: 8020 with the Owner's battery electric bus fleet. Coordination with other equipment and/or items shall include, but not necessarily be limited to, the following:
1. Equipment Mark Number 8030 Electric Vehicle Yard Management System as specified in Section 11 11 36.20 Electric Vehicle Yard Management System
- E. Coordination of equipment and vehicle to allow for corded handheld plug (charge connector) and communication of the Remote Plug-In Dispenser Mark Number: 8025 with the City's battery electric bus fleet. Coordination with other equipment and/or items shall include, but not necessarily be limited to, the following:
1. Equipment Mark Number 8030 Electric Vehicle Yard Management System as specified in Section 11 11 36.20

##### 1.2 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five years' experience supplying specified equipment

**B. Manufacturer's Representative:**

1. Installation: Provide a qualified manufacturer's representative at Project Site to supervise work related to equipment installation, check out and start up.
2. Training: Provide technical representative to train the City's maintenance personnel in operation and maintenance of specified equipment.
3. Testing: Provide technical representative for final testing of equipment.

C. Installation of this equipment item requires initial mock-up and acceptance by design team and the City. Refer to Part 3.02 of this specification section Installation for more details

**1.3 STANDARD AND REGULATORY REQUIREMENTS**

A. Equipment indicated within this specification section shall comply with all applicable Laws, including seismic, fire, and racking codes and regulations. Additional, more specific compliance requirements may be listed under individual equipment headings.

**1.4 SUBMITTALS**

A. Submittal requirements for all equipment items included in this section are listed below.

**B. Product Data:**

1. Submit product data in accordance with Division 1 - General Requirements of these specifications.
2. All product data submittals shall identify proposed project specific items marked by arrow, circle, underline, reproducible highlight, or other markings clearly discernable by the reviewer, to show which specific items, parts and accessories are being submitted for the project product data review. Non-marked or generic product data submittals with no marks indicating specific items, parts and accessories will be a cause for rejection.
3. Restrict submitted material to pertinent data. For instance, do not include manufacturer's complete catalog when pertinent information is contained on a single page.

**C. Operation and Maintenance Manual:**

1. Provide a complete parts list, operating instructions, and maintenance manual covering equipment at time of installation including, but not limited to:
  - a. Description of system and components.
  - b. Manufacturer's printed operating instructions.
  - c. Printed listing of periodic preventive maintenance items and recommended frequency required to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.

- d. List of original manufacturer's parts, including suppliers' part numbers and cuts, manufacturer's recommended spare parts stockage quantity and local parts and service source based on anticipated frequently replaced and or long lead (more than five workdays) components.
  2. Assemble and provide copies of manual in 8-1/2 by 11-inch format. Foldout diagrams and illustrations are acceptable. Manual to be reproducible by dry copy method. Provide copies per provisions of Division 1 - General Requirements.
- D. Shop Drawings: Submit shop drawings in accordance with Division 1 -General Requirements of these specifications.
1. Submitted shop drawings shall be project specific and shall include a minimum 1/8 inch to 1 foot scaled (or larger standard architectural imperial scale), dimensioned, graphical representation of the size, orientation, and location for all instances of submitted equipment in a floor plan view and reflected ceiling plan view for DC charging cabinets, dispenser (pantographs and remote plug-in cabinets) and other system elements. The drawings shall further include dimensions from structural elements or architectural grid lines, to each major charging equipment item (8012, 8020 & 8025) operational clearances, locations of any utility service connection points, power and communication output points, mounting requirements, and structural supports required for the submitted equipment. Indicate which specific dispensers are connected to and energized by which specific DC charging cabinet.
  2. Manufacturer's standard installation drawings will be accepted and reviewed but are not considered as a replacement to project specific shop drawings.
- E. Test Reports: Testing and Commissioning reports are required for all systems included in this specification and shall be included as part of the close-out documents. Provide to the equipment consultant a copy of all testing and commissioning reports for equipment specified herein. Refer to Part 3.03 Testing, of this specification.
- F. Required Documents for Permit and Local Jurisdictional Approval: Where required by local jurisdiction and/or code officials, the Principal Project Company shall be responsible for producing and submitting all documentation required for obtaining all applicable approvals related to the specified equipment. This documentation may include, but may not be limited to, engineered signed and stamped plans, details, anchorage layouts for equipment on stands and as racks to show compliance with locally adopted ASCE, seismic, fire, and other codes. A copy of these required documents shall be included with the product submittal to the design team/consultant team for their review.

## **1.5 WARRANTY**

- A. Warrant work specified herein for one year from Substantial Completion against defects in materials, function, workmanship and charging system operational design.
- B. Warranty shall include materials and labor necessary to correct defects including replacement of charging system operational elements with re-designed components.
- C. Defects shall include, but not be limited to loose, damaged and missing parts and abnormal deterioration of finish, excessive cord wear.

- D. Operational design defects include for pantograph charger and dispenser include systemic bent or non-flexing conductor rails, non-extending / retracting of pantograph due to factory installed elements, failure or intermittent failure to instigate charging process and pantograph deployment due to inability to connect and / or non-communications with vehicle properly aligned below pantograph, failure to deploy pantograph, initiate or complete charging process due to interference from adjacent installed pantographs is an operational design defect. Pantographs conforming to this performance specification are intended to perform in a dense bus parked environment with anticipated adjacent pantographs and battery electric buses on all four sides of surrounding each installed pantograph. Operational design defects for DC charging cabinet and plug-in dispenser include systemic bent charging and charging communications connector pins, damaged charging cord conductors and internal wiring, breakage and deterioration of charging plug-in mating elements (ports, charging connector) during routine daily use of charging system. Submit warranties in accordance with Division 1 - General Requirements of these specifications.
- E. All parts shall be readily available locally in the United States.

## **1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING**

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during shipment and storage in humid, dusty conditions. Equipment shall be stored per manufacturer's recommendation.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and mark number of this specification.
- C. Provide equipment and materials specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

## **1.7 LABELING**

- A. Manufacturer shall securely attach in a prominent location on each major item of equipment a non-corrosive nameplate showing manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. All electrical equipment and materials shall be new and shall be listed by Underwriter's Laboratories, Inc. (U.L.), or other US National Recognized Testing Laboratory (NRTL) acceptable to both the design team and local code officials, in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

## **PART 2 - PRODUCTS**

### **2.1 CHARGING CABINET, BATTERY ELECTRIC BUS, 150KW DC POWER EQUIPMENT MARK NUMBER: 8012**

- A. General:
  - 1. Description: Upright cabinet(s) connected to multiple charger dispensers including:

- a. Facility mounted inverse charging pantograph, and capable of automatically charging the connected battery electric bus (BEB) utilizing DC electrical power. Intended for long term charging of BEBs in overnight parking positions. Unit must be capable of operating in dense installation of multiple mark 8012 charging cabinet units located in same general area.
  - b. Facility mounted standalone stationary cabinet dispenser capable of charging a battery electric bus utilizing DC electrical power after being manually connected to a battery electric bus by a flexible power cord and handheld plug. Intended for short term charging of BEBs in maintenance and service bays.
2. Coordination: Specification information indicated herein is intended as general requirement only. Final design of the system shall be by the manufacturer and shall be presented in the project specific shop drawings in coordination with the Charging Pantograph, Inverse, Facility Mounted Equipment Mark Number: 8020 and Remote Plug-In Dispenser Mark Number 8025 as a fully coordinated, complete design.
3. Compliance: The equipment and final design shall comply with the most current editions of all applicable local, state, and federal codes and regulations, including, but not limited to, those listed below.
- a. SAE International Standard J3105, Electric Vehicle Power Transfer System Using a Mechanized Coupler, most recent edition
  - b. SAE International Standard J3105/1, Infrastructure-mounted Pantograph (Cross-
  - c. Rail) Connection
  - d. SAE J1772: SAE Electric Vehicle and Plug-in Hybrid Electric Vehicle Conductive Charge Coupler, most recent edition.
  - e. NFPA 70: National Electric Code (NEC), most recent edition.
  - f. NFPA 70E: Standard for Electrical Safety in the Workplace, most recent edition
  - g. Underwriter's Laboratory UL 2202, Standard for Electric Vehicle (EV) Charging System Equipment, most recent edition.
  - h. Underwriter's Laboratory UL 2231-1, Standard for Safety for Personnel Protection Systems for Electric Vehicle (EV) Supply Circuits: General Requirements
  - i. Underwriter's Laboratory UL 2231-2, Standard for Safety for Personnel Protection Systems for Electric Vehicle (EV) Supply Circuits: Particular Requirements for Protection Devices for Use in Charging Systems.
  - j. ANSI/IEC 60529: Degrees of Protection Provided by Electrical Enclosures (IP Code), most recent edition.
  - k. IEC 61851-1; 23; 24: Electric Vehicle Conductive Charging System, most recent edition.
  - l. IEC 61000-6-2: Electromagnetic Compatibility (EMC) – Part 6-2: Generic Standards – Immunity Standard for Industrial Environment.

- m. 29 CFR 1910.147: General Environmental Controls, The Control of Hazardous Energy (Lockout/Tagout), as enforced by OSHA, most recent edition.
  - n. International Electrotechnical Commission (IEC) 60309, most recent edition.
  - o. Federal Communications Commission (FCC) rules and regulations, as applicable.
  - p. Open Charge Point Protocol OCPP 2.0 or higher to allow charger control and monitoring by a third-party charge management system
4. Components:
- a. Power Cabinet(s).
  - b. All components, interconnecting cabling and conduits/ducts between components, software, and accessories for a fully and properly operational device.
- B. Capacities and Dimensions:
- 1. Cabinet equipment unit performance to allow total output charge power, DC: Nominal 150 kilowatts (kW), minimum capable to charge a 675kWh battery electric bus (BEB) from a ten percent usable by vehicle state of charge to ninety five percent usable by vehicle state of charge in a consecutive four-hour period from a single dispenser.
    - a. Systems that combine power outputs from two or more separate standalone cabinets to produce the total output charge power of the nominal 150kW minimum and charger time are acceptable and considered equivalent to a single 150kW cabinet unit.
    - b. Systems that employ a single larger kW cabinet with multiple outputs to dispensers that produce the total output charge power of the nominal 150kW minimum and charger time are acceptable and considered equivalent to a single 150kW cabinet unit.
    - c. Quantity of inverted pantographs charging dispensers in bus parking areas, output charge power from entire overhead DC charging system to be capable of charging full quantity of overhead electrically charged vehicles identified on the project drawings in a single consecutive (8) eight-hour period minimum inclusive of charge management peak power reductions, state of charge (SOC) diversity factor as described in addendums and other proposed and verifiable max charging power reduction systems. Additional chargers provided in maintenance and services bays are not to be factored in to charging systems ability to charge the identified BEB fleet size in an eight-hour period.
  - 2. Output voltage range: 200-1,000 volts, DC.
  - 3. Rated DC output current range: 3-250 Amps, bi-directional.
  - 4. Operating temperature range: -22 degrees Fahrenheit (F) to 113 degrees F.
  - 5. Input connections: 3 phase plus protected earth ground wire
  - 6. Input power rating: nominal 205 kVa (full load) / 100 VA (idle)

7. Input AC line-line voltage range: 480 VAC +6/-13%
8. Input AC phase current: nominal 283 amps, maximum / 385 amps fused.
9. Power factor, total harmonic distortion: 0.95, minimum.
10. Power conversion efficiency at full load: 96 percent, minimum.
11. Dielectric withstand: 3,000 volts, root mean square (RMS).
12. Network connection: 4G/LTE modem, minimum, utilizing Open Charge Point Protocol (OCPP) 2.0 or later network communication.
13. Protection: IP54 and IK 10 or equivalent NEMA rating.
14. Operational noise level: 85 decibels, maximum.
15. Overall dimensions, power cabinet(s), maximum nominal:
  - a. Width: 40 inches.
  - b. Depth: 40 inches.
  - c. Height: 91 inches.
  - d. Weight: 2,200 pounds.

C. Features and Construction:

1. Each electrical cabinet to be a standalone unit capable of meeting the specification herein. The cabinet shall include capability for entry of alternating current (AC) electrical supply, main isolation transformer cabinet, AC to DC power conversion, AC grid coupling and protective devices, DC output coupling and protective devices, controller for charger circuit and the communication equipment, and forced-air over coolant chiller functions.
2. Capable of being connected to power supply grid or low voltage power distribution station.
3. Charge cabinet configurable to support either multiple overhead pantograph dispensers or plug-in dispensers. Individual cabinet not required to be capable of being connected to and simultaneously or concurrently energizing a mix of both pantographs and plug-in dispensers. Concurrent charging is preferred but sequential charging systems in bus parking areas will be considered based on submitted charging performance. Concurrent charging only to be used at maintenance bay plug-in dispensers.
  - a. On concurrent controlled and powered dispensers, shared dispensers connected (dispenser A, dispenser B+), to a single DC power cabinet, the nominal output (voltage, current, power, charging telemetrics, and controls) to the simultaneously connected remote dispensers will be split from the DC power cabinet and, as controlled by the DC power cabinet's shared dispenser charging priority system, power one remote dispenser unit (dispenser A) up to the nominal maximum outputs while simultaneously and concurrently providing minimal or remaining DC

power cabinet's output to the other shared connected remote dispenser units (dispenser B+) until all BEBs connected to the shared charging dispensers are fully energized. During this concurrent controlled charging process, after BEBs initial dispenser connection, plug-in or pantograph connection at the beginning of the charging process, no manual re-plugging / disconnection, re-plugging / reconnection, re-paring or wireless connection of charge connector or pantograph will be necessary.

- b. On sequentially controlled and powered dispensers, shared dispensers connected to a single DC power cabinet, the nominal output (voltage, current, power) to the simultaneously connected remote dispensers (dispenser A, dispenser B+) will be shifted from the DC power cabinet and, as controlled by the DC power cabinet's shared dispenser charging priority system, power one remote dispenser (dispenser A) unit up to the nominal maximum outputs while not providing output to any other connected shared remote dispenser units (dispenser B+). As controlled by the DC power cabinet's shared dispenser charging priority system, the DC power cabinet's output will then automatically switch and shift the output (from dispenser A) to another connected and shared remote dispenser unit (dispenser B) up to the nominal maximum outputs (to dispenser B) while not providing output to any other connected shared remote dispenser units (dispenser A, C+). The shifting of power output between the various connected shared remote dispenser units continues until all BEBs connected to the shared charging dispensers are fully energized. During this sequential controlled charging process, after BEBs initial dispenser connection, plug-in or pantograph connection at the beginning of the charging process, no manual re-plugging / disconnection, re-plugging / reconnection, re-paring or wireless connection of charge connector or pantograph will be necessary.
4. Capable of being configured to operate dispenser configuration and energizing a minimum quantity of:
    - a. Two (2) Charging Pantograph, Inverse, Facility mounted Equipment Mark Number: 8020 and capable of providing charging power to each pantograph either sequentially or concurrently. Includes all interconnecting electrical cabling, data cabling, conduit / ducts, distribution boxes, DC switches (internal to charging cabinet and external from charging cabinet) and all other components necessary for interconnection.
    - b. Four (4) Remote Plug-In Dispenser Equipment Mark Number: 8025 and capable of providing charging power to each plug-in dispenser concurrently. Includes all interconnecting electrical cabling, data cabling, conduit / ducts, and all other components necessary for interconnection.
  5. Intended for, and fully capable of, installation in an outdoor environment, with a thermal and water-resistant enclosure. Cabinet(s) shall include an integral raised base for protection of equipment and fastening to sub-structure. Raised base should allow for mounting to an elevated steel support frame and not require direct to concrete pad installations.
  6. Includes an on-board transformer / rectifier, allowing the power cabinet to receive an alternating current (AC) input power connection from the facility electrical supply and convert it to DC electrical output to the charge box and connected bus.

7. Includes a chiller unit capable of maintaining manufacturer's required temperature for power conversion components. Chiller shall include protective air intake grill(s) and fan(s).
8. Include internal DC distribution box / DC Switch to control and manage DC outputs within the charger cabinet enclosure.
  - a. Charging cabinets relying on DC distribution boxes / DC switches that are external to the charging cabinet are acceptable but all components of the external multiple DC output control / management system are to be supplied and installed as part of the charging cabinet system including additional conduits, power and control wiring, DC distribution boxes / DC switches, mounting and supporting structural elements to locate the DC distribution boxes / DC switches from the building structure.
    - 1) All additional structural loading (weights and reactions), physical space requirements (sizes, clearances, requirements for manual interactions) of an external to charging cabinet DC distribution box / DC Switch to be included with initial approval submission of charging system by the City. Additional charging system components, installation labor, software, or physical controls added to approved charging cabinet system that were not presented as required in initial charging cabinet system review are grounds for negating original submission approval.
9. Unit is designed to be installed with multiple similar mark 8012 charging cabinet units in a dense location and vent locations of cabinets to facilitate close proximity installations between similar cabinets to sides and rear of unit.
10. Include forklift pockets at base of unit or lifting lugs on top and or side of unit. Units that utilize no mechanical connections for lifting and rely solely on wrapped / strapping connections around unit cabinet case to install, position or remove unit are not acceptable.
11. Controller shall include the protective ground connection, the DC output voltage connections, and the supervisory control components.
12. Communications portion of the controller equipment shall be capable of being connected to other computer networks, including networks with charge management systems, through Ethernet and/or wireless connection. The power cabinet shall be capable of communicating to that charge management system by means of an open source, non-proprietary, communication protocol.
13. Includes a cellular antenna, 4G/LTE or better, enabling connection to cellular networks.
14. Includes on-board computer and/or programmable logic devices, software, and wireless communication devices that, at a minimum, also provide the following functionality to the power cabinet:
  - a. Pantograph Dispenser
    - 1) To wirelessly detect BEB mounted transponders within each attached Facility Mounted Inverse Charging Pantograph's (Pantograph) operational area and ignore transponders outside each attached Pantograph's operational area

including similar transponders located on all four sides surrounding transponder installation. This process shall be automatic, and performed at system start-up / system re-start, and at programmable intervals and times, up to and including near continuous detection.

- 2) To initiate wireless signal with, receive wireless signal from, and establish a wireless communication protocol with any bus in the Owner's BEB fleet that is determined by the system as being parked within the pantograph's operational area, and that has an on-board transponder (by others).
  - 3) To communicate with, and automatically cause each attached individual Pantograph to descend once a BEB has been identified, communication established, and has been detected as 'parked' within that Pantograph's individual operational area. The equipment shall ignore BEBs passing through a Pantograph's operational area.
  - 4) Automatically cause an attached Pantograph to retract upon receiving a 'disengage' signal from a connected BEB that is parked in that Pantograph's operational area,
  - 5) Automatically cause each Pantograph to retract to a 'fail safe' state when receiving pertinent error codes, and upon facility power outages and major fluctuations. 'Fail safe' Pantograph retraction shall occur for individual isolated Pantographs and system wide for all Pantographs, depending on error code.
  - 6) Automatically terminate wireless communication with any BEB after a pre-programmed time, and after detecting the BEB is no longer in operational range, or when the BEB is disengaged.
- b. Plug-In Dispenser
- 1) To initiate signal with, receive signal from, and 'handshake' with any bus connected by means of the charge connector while charge connector is plugged into the charging port of a bus.
  - 2) To automatically start, stop, and regulate any charge to any bus battery connected by means of the charge connector while charge connector is plugged into the charging port of a bus.
  - 3) To communicate wirelessly collected bus information to a charge management system regardless of whether the charge connector is plugged into or disconnected from the charging port of a bus.
- c. Once wireless communication is established with the bus, to communicate with, request and receive from the BEB the following information: bus identification and battery information such as charge status, temperature, etc.
- d. Information collected shall be stored, and able to be transmitted to a charge management system.
- e. To automatically start, stop, and regulate any charge to any bus battery connected by means of the Facility Mounted Inverse Charging Pantograph or charge connector.

- f. To request, receive, and store bus battery information such as ID, charge status, temperature, etc. from the bus by means of wireless communication with the bus being charged.
  - g. To allow Owner's charge management system to control and report a minimum feature set of each charging cabinet in real time:
    - 1) Cabinet connected dispenser / pantograph status – connected to a vehicle / not connected to a vehicle
    - 2) Cabinet on (allowing charging to occur) / off (not allow charging to occur)
    - 3) Total cabinet power output
    - 4) Report vehicle ID connected to each dispenser / pantograph connected to DC charging cabinet
    - 5) Cabinet not operational / unit issuing trouble code
15. Lock-out / Tag-out functions – preference is for AC input to charging cabinet to enter at a charging cabinet internally integrated disconnecting means compliant with NEC 625.42 and not require a separate external disconnect. Systems requiring external disconnects will be considered but requirement of need for separate disconnect means and inclusion of external disconnects are required on all submitted product data and project specific shop drawings and charger layouts. Lock-out / Tag-Out functions shall include, at a minimum, the following:
- a. AC supply entry cabinet shall not be allowed to open under live grid conditions and shall only be allowed to open only if the main power supply to the charger is locked out.
  - b. Main transformer cabinet(s) and AC/DC converter cabinet shall not be allowed to open under live grid conditions and shall only be allowed to open if there are no live grid conditions to the charger and if the main power supply breaker is locked out.
  - c. The chiller cabinet shall not be allowed to open while the charger is energized but shall only be allowed to open if the charger is de-energized and the auxiliary switch is locked out.
16. Emergency Stop Button directly accessible on the outside of the power cabinet. Allows for emergency stopping of the charger and de-energizing of the charging system.
17. Group Remote Emergency Stop Button capable. Allows for connections to auxiliary emergency stop buttons remotely located in the facility and connected to multiple equipment mark 8012 charging cabinet units to stop / reset charging cabinet units as a group. Remote emergency stop reset should not require individual resetting of mark 8012 charging cabinet's factory installed cabinet integrated emergency stop button after remote emergency stop button reset.
18. Remote manual override controls for the Pantograph, capable of extending or retracting the Pantograph on demand and re-start charging wireless validation and the charging process without the need to physically re-park or reset individual vehicle parking brakes. Override controls shall include a key switch and keys for operation.

19. Includes all other components for necessary and proper function of the unit including, but not necessarily limited to, metal support frame and protective panel enclosure, foundation support base, air intake and exhaust vents, forced air cooling fans, air filters, grounding devices and connections, cables, cords, connectors, etc.

D. Finish: Exterior panels of power cabinet to have protective finish to prevent corrosion of enclosure. Provide in Owner's choice of manufacturer's standard colors.

E. Accessories:

1. Refer to Equipment Mark Number 8020 for Charging Pantograph.
2. Refer to Equipment Mark Number 8025 for Remote Plug-In Dispenser.
3. Coolant, in quantity and type as required by manufacturer.
4. Fabricated steel support stand, capable of elevating and properly supporting the DC power cabinet unit. Steel shall be hot-dip galvanized in accordance with ASTM A123 Standard. Refer to drawings for details.
5. Emergency Stop Button (E-Stop) – directly accessible on the outside of the DC power cabinet. Allows for emergency stopping / de-energizing output of all remote dispenser units connected to a single DC power cabinet whose E-Stop button is activated
6. Group Remote Emergency Stop Button (E-Stop) – in quantities and locations as shown on the drawing. Allows for emergency stopping / de-energizing output of all remote dispenser units connected to a multiple DC power cabinets in groupings as shown on the drawings.
7. External DC Output Distribution Box / DC Output switches if required

F. Utilities:

1. Electrical: 480 VAC, 3 Phase, 60 Hz, nominal 283 amps maximum / 365 amps, maximum inrush (fused).

## **2.2 CHARGING PANTOGRAPH, INVERSE, FACILITY MOUNTED EQUIPMENT MARK NUMBER: 8020**

A. General:

1. Description: An overhead facility mounted retractable pantograph capable of automatically connecting to the roof mounted charging contacts of buses in the Owner's battery electric bus (BEB) fleet, and then automatically charging the connected bus utilizing direct current (DC) electrical power via the connected Charging Cabinet, Battery Electric Bus, 150kw DC Power, Equipment Mark Number: 8012.
2. Coordination: Specification information indicated herein is intended as general requirement only. Final design of the system shall be by the manufacturer and shall be presented in the project specific shop drawings in coordination with the Charging Cabinet, Battery Electric Bus, 150kw DC Power, Equipment Mark Number: 8012 as a fully coordinated, complete design.

3. Compliance: The equipment and final design shall comply with the most current editions of all applicable local, state, and federal codes and regulations, including, but not limited to, those listed below.
  - a. SAE International Standard J3105, Electric Vehicle Power Transfer System Using a Mechanized Coupler, most recent edition.
  - b. SAE International Standard J3105/1, Infrastructure-mounted Pantograph (Cross-Rail) Connection
  - c. NFPA 70: National Electric Code (NEC), most recent edition.
  - d. Underwriter's Laboratory UL 2202, Standard for Electric Vehicle (EV) Charging System Equipment, most recent edition.
  - e. Underwriter's Laboratory UL 2231-1, Standard for Safety for Personnel Protection Systems for Electric Vehicle (EV) Supply Circuits: General Requirements
  - f. Underwriter's Laboratory UL 2231-2, Standard for Safety for Personnel Protection Systems for Electric Vehicle (EV) Supply Circuits: Particular Requirements for Protection Devices for Use in Charging Systems.
  - g. ANSI/IEC 60529: Degrees of Protection Provided by Electrical Enclosures (IP Code), most recent edition.
  - h. ANSI/IEC 61851-23: Electric Vehicle Conductive Charging Systems, DC Electric Vehicle Charging Station.
  - i. 29 CFR 1910.147: General Environmental Controls, The Control of Hazardous Energy (Lockout/Tagout), as enforced by OSHA, most recent edition.
  - j. International Electrotechnical Commission (IEC) 60309, most recent edition.
  - k. Federal Communications Commission (FCC) rules and regulations, as applicable
- B. Capacities and Dimensions:
  1. Pantograph:
    - a. Rated Voltage: 1,000 volts, DC, minimum
    - b. Rated charging current: 250 Amps (A), minimum.
    - c. Operating temperature range: -22 degrees Fahrenheit (F) to 150 degrees F
    - d. Pantograph operating range, from partial to full extension (nominal): 30 inches to 90 inches
  2. Pantograph controller and motor:
    - a. Supply voltage: 24 volts, DC
    - b. Current: 40A nominal.
    - c. Pantograph contact force with vehicle: 112 foot-pounds, maximum

- d. Total time to raise pantograph from full extension to full retraction: 5 seconds, maximum.
- e. Total time to lower pantograph from full extension to full retraction: 5 seconds, maximum.
- f. Compensation of pantograph to the parked bus, nominal:
  - 1) X-axis: 30 inches to the vertical axis
  - 2) Y-axis: +/- 12 inches to the transversal axis
  - 3) Z-axis: +/- 12 inches to the longitudinal axis
- 3. Compensation of angles: 5 degrees each direction
- 4. Wireless Communication System:
  - a. Wireless system communication: CAN bus with SAE J1939 communication protocol.
  - b. Wireless data interface between antenna and antenna controller: RS-232, Ethernet
  - c. Communication protocol between antenna and antenna controller: Serial.
  - d. Wireless antenna:
    - 1) Dimensions, nominal: 12 inches, 9 inches, 6 inches.
    - 2) IP Rating: IP 66 or equivalent NEMA rating
    - 3) Specified range: Capable of detecting bus mounted system transponder within an 8-foot radius of the antenna. Capable of transmitting to and receiving information from any bus mounted system transponder with the 8-foot radius from the antenna. Able to ignore similar surrounding transponders directly adjacent to but outside of the 8-foot radius.
- 5. Wireless Antenna Controller:
  - a. Dimensions, nominal: 36 inches, 28 inches, 16 inches.
    - 1) 1) IP Rating: IP 66 or equivalent NEMA rating
- 6. Wireless Transponder and Data Collector:
  - a. Connect to vehicle via SAE J1939 connectors.
- 7. Overall dimensions, nominal:
  - a. Length: 57 inches nominal maximum
  - b. Width: 40 inches nominal maximum
  - c. Height: 42 inches nominal maximum in retracted position

- d. Necessary clearance in x-axis: 2 inches
  - e. Necessary clearance in y-axis (length of rails + clearance): 25 inches + 2 inches
8. Dimensions of interface, nominal:
- a. Length (total): 57 inches
  - b. Length (single contact): 40 inches
  - c. Width: 30 inches
9. Pantograph positions, from mounting plane (underside of facility structure), as noted on drawings
- C. Features and Construction:
1. Pantograph and Pantograph Controller:
- a. 'Inverted' pantograph down design mounted to the facility structure and extending down to contact vehicle mounted charging contact bars.
  - b. Pantograph and pantograph controller shall have integrated fail-safe functions. Functions shall include automatic full retract of the Pantograph upon error code, power loss, or other system malfunction.
  - c. Independently insulated multi-pole contacts: positive, negative, protected earth (ground) and control pilot.
  - d. Zero electrical potential frame components.
  - e. Includes flexible head and spring-loaded connection allowing for compensation of the pantograph system.
  - f. Capable of raising and lowering the pantograph to pre-programmed height/positions.
  - g. Capable of both quick duration contact fast-charge and long duration depot charging.
  - h. Includes an internal sensor to provide a soft-stop landing on the bus roof rails.
  - i. Capable of being de-energized by charging cabinet e-stop systems (cabinet mounted e-stop and additional remote group e-stops)
2. Wireless Communications System Antenna and Antenna Controller: Shall be mounted in a fixed position near the pantograph and contain a programmable logic controller, or similar computing device, along with all accessories (such as cooling devices) necessary for proper operation. Together, the Antenna and Antenna Controller shall be able to perform the following functions:
- a. The Controller shall be able to compute relative distances of bus mounted transponders from the Antenna.

- b. The Controller shall be able discriminate between bus mounted transponder distances and acknowledge and communicate with any bus mounted system transponder located only within the programmed Pantograph operational area. Transponder signals outside of the operational area shall be ignored.
  - c. The Controller shall be able to instantly compare each Bus Identification Number received from a bus transponder signal within the specified range to a central Bus Identification Number Authorization File (or similar). The Controller shall continue to try and communicate with bus transponders allowed by the Authorization File and shall ignore signals from bus transponders disallowed by the Authorization File.
  - d. Upon initial detection of any bus transponder within the Pantograph operational area, and allowed by the Authorization File, the Controller will immediately search for confirmation signals that the same bus transponder is still within the operational area. If confirmation signals are detected, then the “handshake” communication protocol shall be established between the Controller and the transponder, via the Antenna. If confirmation signals are not detected, then no communication protocol shall be established, and the Antenna and Controller shall continue to search for a transponder signal within the operational area.
  - e. Upon successful establishment of the “handshake” communication protocol, a communication link shall be established to enable the Controller to read information from the bus mounted Transponder via wireless communication through the Antenna. For the duration of the communication link, the antenna will only accept information from the connected transponder. All other transponder signals shall be ignored.
  - f. During the life of the communication link, the Controller shall periodically ping the linked transponder and confirm the transponder is still within the specified range of the Antenna and Controller. If so, the communication link shall not be terminated. If not, the Controller shall immediately terminate the link, and begin to search for a transponder signal within the specified range.
  - g. Controller shall have a physical and/or wireless data connection to the Owner’s network, and capable of periodically accessing and reading the Owner’s Bus Identification Number Authorization File. Periodic access shall be programmable and shall occur at regular intervals.
  - h. Controller shall be capable of establishing a secure internet connection through the Owner’s network to regularly and periodically download software updates.
3. Wireless Communications System Software: Programs as necessary for functioning of each individual Antenna Controller, as well as a central software program for managing multiple Antenna Controllers within a single site. Central software program shall be web based, or compatible with Owner’s Windows compatible PCs.
  4. Includes all other components for necessary and proper function of the unit including, but not necessarily limited to, metal support frame and protective panel enclosure, foundation support base, grounding devices and connections, cables, cords, connectors, etc.

- D. Finish: Corrosion and wear resistant finish in Owner's choice of manufacturer's standard colors.
- E. Accessories:
  - 1. Modular metal framing system to provide support and stability to items suspended from facility structure. Configuration, quantity and spacing to be determined as part of contractor's final design.

## **2.3 REMOTE OVERHEAD DISPENSER EQUIPMENT MARK NUMBER: 8025**

### A. General:

- 1. Description: A stationary upright cabinet with a flexible power cord and corded handheld plug (charge connector) capable of being manually connected to the charging port of buses in the Owner's electric bus fleet, and then automatically charging the connected bus utilizing DC electrical power output generated from a connected Mark Number 8012 DC Power Cabinet.
- 2. Compliance: The equipment and final design shall comply with the most current editions of all applicable local, state, and federal codes and regulations, including, but not limited to, those listed below.
  - a. NFPA 70: National Electric Code (NEC), most recent edition.
  - b. SAE J1772: SAE Electric Vehicle and Plug-in Hybrid Electric Vehicle Conductive Charge Coupler, most recent edition.
  - c. ANSI/IEC 60529: Degrees of Protection Provided by Electrical Enclosures, most recent edition.
  - d. Open Charge Point Protocol OCPP 2.0 or higher to allow charger control and monitoring by a third-party charge management system.
  - e. NFPA 70E: Standard for Electrical Safety in the Workplace, most recent edition.
  - f. CFR 1910.147: Code of Federal Regulations, Occupational Safety and Health Standards, General Environmental Controls, The Control of Hazardous Energy (Lockout / Tagout), most recent edition.

### B. Capacities and Dimensions:

- 1. Output voltage range at the remote dispenser, refer to Equipment Mark Number: 8012
- 2. Output current at the remote dispenser, refer to Equipment Mark Number: 8012
- 3. Output power at the remote dispenser, refer to Equipment Mark Number: 8012
- 4. Overall dimensions, remote dispenser, nominal:
  - a. Width: 24 inches.
  - b. Depth: 9 inches.
  - c. Height: 32 inches.

- d. Weight: 60 lbs (including weight of cord and charge connector below)
- e. Cable length: 22 feet - nominal.
- f. Charging Connector – SAE J1772 CCS Level 2 plug-in connector with strain relief

C. Features and Construction:

1. Remote dispenser unit shall be connected to and receive power output (voltage, current, power, charging telemetrics and controls) from the DC power cabinet, then regulate and transmit that output to the bus, when manually connected by the charging connector.
  - a. Include glass fiber (or similar) communications lines between the DC power cabinet and remote dispenser, as well as all necessary protective conduits, seals, and fasteners.
  - b. Remote dispenser enclosure shall be rated IP65 protection, per ANSI/IEC 60529.
2. Dispenser cabinet to be mounted in locations shown on plans but anticipated to be mounted to existing facility structural elements or being suspended from overhead structural frame supported by existing facility structure. Ground mounted support stands for plug-in dispensing cabinet located in Maintenance and Service bays are not to be utilized unless specifically call for on plans.
3. Charging connector and attached cord shall be capable of being manually connected to, and disconnected from, the bus charger. Charging connector shall conform to SAE J1772 SAE standard.
4. Charger Status Indicator Light on bottom or side of remote dispenser cabinet and visible to an operator below the plug-in dispenser cabinet when mounted overhead. If charge status indicator light is standard on the top of the cabinet and cabinet orientation does not allow a user below to see the cabinet, providing a secondary cabinet mounted or adjacent mounted to facility structure remote charger status indicator light is acceptable. Three (3) color or more to indicate via color and blinking the following:
  - a. Charger Energized and Ready
  - b. Charger Connected and Charging
  - c. Charger Connected and Charge Complete
  - d. Charger Not Ready / Not Charging / Warning Indicator
5. Coordinate installation of the dispenser cord, the dispenser cabinet, and the charging connector in the field so that, once installed, there is minimal bending and/or twisting of the dispenser cord, or 'flipping' of the charge connector, when personnel attempt to plug the charge connector into a battery electric bus.
6. Emergency Stop Button directly accessible on the outside of the remote dispenser box. Allows for emergency stopping of the charger and de-energizing of the plug-in charging system.

7. Group Remote Emergency Stop Button capable. Allows for connections to auxiliary emergency stop buttons remotely located in the facility and connected to multiple equipment mark 8025 charging cabinet units to stop / reset charging cabinet units as a group. Remote emergency stop reset should not require individual resetting of mark 8025 charging cabinet's factory installed plug-in cabinet integrated emergency stop button after remote emergency stop button reset.
- D. Finish: Exterior panels of charger box to have protective powder coat finish in Owner's choice of manufacturer's standard colors.
- E. Accessories:
1. Modular metal framing system to provide support and stability to items suspended from existing horizontal or vertical structural facility elements. Configuration, quantity and spacing to be determined as part of contractor's final design. Kindorf or equal.
  2. Cord hook / rack to store and secure flexible power cord and charge connector at nominal five foot above finish floor when not in use.
  3. Remote secondary charge status indicator light as needed.

## **PART 3 - EXECUTION**

### **3.1 INSPECTION**

- A. Coordinate location of rough-in work and utility stub-outs to assure match and/or non-interference with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all items.

### **3.2 INSTALLATION**

- A. Perform work under direct supervision of foreman or construction superintendent with authority to coordinate installation of scheduled equipment with design team.
- B. Coordinate work with Manufacturer's Representative indicated in Part 1.02 of this specification section
- C. Install equipment in accordance with plans, approved shop drawings, and manufacturer's instructions:
  1. Initial City mockup for positioning pantograph Equipment Mark: 8020: At a parked bus charging position to be identified by the City, provide installation mockup of DC charging cabinet connected to an overhead pantograph, wireless communications system to allow for testing and proofing of DC charging system component mounting heights and overhead locations or components relative to parked bus. Mock-up to allow for in- field adjustment of individual charging components, including but not necessarily limited to, electrical junction boxes, mounting and support brackets, and pantograph orientation and auxiliary control connection points. In field adjustments shall consist of those necessary to allow the overhead pantograph to be deployed

automatically when a bus is properly parked in the charging position and wireless communications system is engaged. Mock-up shall be reviewed and approved by design team and the City prior to installation of other overhead charging components. Overhead components purchased or installed prior to mock-up approval shall be modified to conform to the approved mock-up without additional material or labor charges to the City

2. Positioning: Place equipment in accordance with any noted special positioning requirements generally level, plumb and at right angles to adjacent work.
3. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
4. Anchorage: Attach DC charging cabinet equipment securely to floor or elevated support frame, in conformance with manufacturer's instructions and as directed by design team, to prevent damage resulting from inadequate fastening and to resist seismic movement. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

### **3.3 TESTING**

- A. After final connections are made and prior to authorizing payment, specified equipment shall be tested for compliance with specification in the presence of the design team using acceptance procedures provided by the manufacturer.
- B. Final testing and post installation inspection are required and shall be performed by the manufacturer or the manufacturer's designated representative only. Final testing and inspection shall not be performed by the installer, unless the installer is also the manufacturer.
- C. Manufacturer / Installer shall provide a testing procedure and checklist that indicates proper testing of all major functions of the equipment. This procedure and checklist will form the basis of the testing process.

### **3.4 CLEANUP**

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing or installation debris from job site.
- D. Notify design team for acceptance inspection.

### **3.5 TRAINING**

- A. Direct the technical representative to provide specified hours of training to the City's designated maintenance personnel in operation and maintenance of the following equipment. Coordinate, with Owner, training schedule and list of personnel to be trained.
  1. CHARGING CABINET, BATTERY ELECTRIC BUS, 150KW DC POWER Equipment  
Mark Number: 8012

- a. Hours Required: 16
2. CHARGING PANTOGRAPH, INVERSE, FACILITY MOUNTED Equipment Mark Number: 8020
  - a. Hours Required: Included in training for Equipment items listed above.
3. REMOTE PLUG-IN DISPENSER Equipment Mark Number: 8025
  - a. Hours Required: Included in training for Equipment items listed above.
- B. Obtain, from technical representative, a list of the City's personnel trained in equipment operations and maintenance.
- C. Provide a Windows compatible movie file format recording on USB stick of the training session. The training movie can be a recording of a live session or a produced training video

## 6. TESTING & COMMISSIONING AND OPERATIONAL READINESS

### 6.1 Introduction

The purpose of Commissioning is to provide a systematic process of assuring by verification and documentation, from the design phase and throughout the Term, that all Project systems perform interactively in accordance with the Contract Documents. The parties acknowledge that because many Project systems are integrated, a deficiency in one or more components can result in sub-optimal operation and performance among other components. Remedying these deficiencies can result in a variety of benefits including: (i) improved productivity of Project users; (ii) lower utility bills through energy savings; (iii) increased satisfaction of Project users; (iv) enhanced environmental conditions, health conditions and comfort of Project users; (v) improved Project system and Project Equipment function; (vi) improved Project operation and maintenance; (vii) increased safety for Project users; (viii) better Project documentation; (ix) shortened occupancy transition period; and (x) significant extension of Project equipment and Project systems life cycles.

This Division 6 sets forth the minimum Commissioning requirements Principal Project Company is required to comply with.

#### 6.1.1. Definitions

All capitalized terms used in this Division 6 shall have the meaning given to them in this [Section 6.1.1](#) or, if not defined here, in Exhibit 1 to the Agreement.

**Commissioning or Building Commissioning:** A process consistent with ANSI/ASHRAE/IES Standard 202-2018 that focuses upon verifying and documenting that the Infrastructure Facility and all its systems and assemblies are planned, designed, installed, and tested to meet the Contract Documents.

**Commissioning Issues and Resolution Log:** Has the meaning set forth in [Section 6.5.2.3](#) of this division.

**Commissioning Provider (CxP):** The entity that leads, plans, schedules, and coordinates the Commissioning team to implement the Commissioning process.

**Commissioning Plan:** The plan prepared, submitted and updated by Principal Project Company that outlines the organization, schedule, allocation of resources and documentation requirements of the Commissioning process that meets the requirements of [Section 6.5.2.1](#) of this division, as approved by the City.

**Commissioning Report:** Has the meaning set forth in [Section 6.5.3.7](#) of this division.

**Commissioned Systems:** Has the meaning set forth in [Section 6.4](#) of this division.

**Commissioning Team:** The individuals who, through coordinated actions, are responsible for implementing the testing and Commissioning process as described in the Commissioning Plan. The team shall include Principal Project Company, City, D&C Contractor representatives, CxP, design professionals, Contractors, and manufacturer's representatives.

**Monitoring-Based Commissioning (MBCx):** Has the meaning set forth in [Section 6.7](#) of this division.

**Ongoing Commissioning Plan:** Has the meaning set forth in [Section 6.5.4.5](#) of this division.

**Operational Readiness Working Group (ORWG):** Has the meaning set forth in [Section 6.8](#) of this division.

**Operational Readiness (OR):** Has the meaning set forth in Section 6.8 of this division.

**Operational Readiness Plan:** Has the meaning set forth in Section 6.8 of this division.

**Seasonal Testing:** Has the meaning set forth in Section 6.5.4.2 of this division.

**Systems Manual:** Has the meaning set forth in Section 6.5.4.1 of this division.

## 6.2 Standards and Guidelines

The Infrastructure Facility shall be Commissioned in compliance with all, but not limited to, the latest editions of codes and standards listed below:

ASHRAE Standard 202- 2018; “Commissioning Process for Buildings and Systems”.

ASHRAE Guideline 0-2019; “The Commissioning Process”.

ASHRAE Guideline 1.1-2007; “HVAC&R Technical Requirements for the Commissioning Process”.

ASHRAE Guideline 1.4-2019; “Procedures for Preparing Facility Systems Manuals”.

ASHRAE Guideline 4-2019; “Preparation of Operating and Maintenance Documentation for Building Systems”.

NECA 90-2015; “Commissioning Building Electrical Systems”.

NFPA 3-2021; “Standard for Commissioning of Fire Protection and Life Safety Systems”.

NFPA 4-2024; “Standard for Integrated Fire Protection and Life Safety System Testing”.

ASTM E2813 – 2018; “Standard Practice for Building Enclosure Commissioning”.

ASTM E2947 – 2021a; “Standard Guide for Building Enclosure Commissioning”.

NIBS Guideline 3-2012; “Building Enclosure Commissioning Process BECx”

USGBC, Leadership in Energy and Environmental Design (LEED™).

CALGreen

Manufacturer guidelines for equipment testing.

NFPA 110 - 2022 Edition: “Testing of Emergency Power Systems.”

NFPA 21 - 2020 Edition: “Testing of Fuel Oil Systems.”

## 6.3 LEED

Principal Project Company is required to file for and achieve a gold level certification for the Project under the Leadership in Energy and Environmental Design (LEED™) V4 (or the most current fully released version of LEED) program, as detailed in Division 3, Section 3.4, of the Technical Requirements. As part of the LEED™ Gold certification, Principal Project Company shall meet the Energy and Atmosphere prerequisite, “Fundamental Commissioning and Verification” of the building energy systems and shall attain the “Enhanced Commissioning” credits in full (6 points).

In general, the Commissioning process as described in this Division 6 will meet and exceed LEED™ and CALGreen certification requirements.

## 6.4 Commissioned Systems

The Infrastructure Facility shall be delivered on a full turn-key basis in accordance with the Contract Documents, including the Commissioning of all systems, assemblies, and equipment provided and installed by Principal Project Company, which shall include:

- Mechanical, including HVAC&R equipment and controls;
- Plumbing, including domestic hot water systems, fire suppression system, pumps, controls and compressed air system; electrical, including service, distribution, lighting, and controls, including daylighting controls;
- Building Automated System;
- Emergency and standby power systems;
- Renewable energy systems (if applicable);
- Audio and visual systems;
- Security systems;
- Smoke control and fire alarm systems;
- Building enclosure systems and assemblies;
- SFMTA O&M Facilities and items on the Equipment List including but not limited to:
  - Bus maintenance lifts;
  - Traction power systems;
  - Compressed air connections to hose reels and process equipment for tire shop, paint shop, sheet metal shop, preventive maintenance bays, lower-level work area (LLWA) preventive maintenance bays, bus wash and service areas;
  - Loading dock systems;
  - IT room cooling;
  - Circulation fans;
  - Gear oil, differential fluid, coolant and power steering tank systems and tank monitoring system;
  - Used coolant collection and tank system, including monitoring;
  - Used oil collection and tank system, including monitoring;
  - Bus wash equipment and monitoring system;
  - Security management system;
  - Bus garage gas detection equipment;
  - Fire command center; and
  - Bridge crane – 5 ton

(together the “Commissioned Systems”).

## 6.5 Commissioning Provider (CxP)

Principal Project Company shall engage the services of a City-accepted CxP having technical background and in-depth expertise with the Commissioning process including verification techniques, functional performance testing, system equipment and operation and maintenance knowledge. The CxP must be an entity that specializes in building Commissioning and shall be commercially independent of any person already engaged by Principal Project Company for provision of the Contract Services.

The CxP shall bring a total building Commissioning perspective to the Project and be knowledgeable in (and where applicable, federal, State and local): (i) building fire codes; (ii) water-based extinguishing systems; (iii) detection systems; (iv) LEED; (v) energy codes, energy efficient design strategies; (vi) building envelope materials, components, assemblies, and systems; (vii) high performing building management and controls; and (viii) other building requirements.

The CxP will take the lead role in coordinating the entire Commissioning process on behalf of Principal Project Company, from preparation of the Commissioning Plan through to the completion of Commissioning. To fulfil all Commissioning requirements, the CxP may be one or more firms with special skillsets working together. In all cases, however, the CxP must be led by single firm with a designated individual responsible for all Commissioning work.

The CxP shall be Principal Project Company's only representative with respect to the Commissioning process, and shall be the only point of contact in respect of Commissioning matters for the City throughout the Commissioning process.

The CxP shall have specialized experience in Commissioning recently constructed buildings of similar complexity, size and type to the Infrastructure Facility. In the event that Principal Project Company proposes a CxP that the City reasonably believes cannot meet the requirements stated in this Division 6, Principal Project Company shall propose an alternative CxP that the City accepts. If the parties are unable to agree with the CxP, the CxP shall be selected in accordance with the dispute resolution procedures set forth in Article 18 (Partnering; Contract Dispute Procedures) of the Agreement.

Principal Project Company shall propose a person acceptable to the City who can act as a substitute for the named CxP in the event that the CxP is unavailable or otherwise unable to complete this role.

## **6.6 Commissioning Scope**

For the avoidance of doubt, all Commissioning procedures, processes, activities, and reporting will apply to all Commissioned Systems, including SFMTA O&M Facilities. The CxP shall report to Principal Project Company but be available to answer questions from the City and will coordinate with the City on site visits, testing activities, and trainings.

### **6.6.1. Summary**

Principal Project Company shall hire a CxP to perform the scope contained in this Division 6, as well as perform testing required elsewhere the Technical Requirements, such as Division 4 (Supplemental Design Criteria).

The CxP shall perform the following tasks, which are further detailed in subsequent sections:

- Review design documentation including the BODR;
- Prepare, update, implement, and comply with the Commissioning Plan;
- Confirm integration of Commissioning activities into the Project Schedule;
- Review Principal Project Company and D&C Contractor submittals pertaining to Commissioned Systems;
- Develop site observations reports during construction for Commissioned Systems;
- Develop construction checklists;
- Develop systems test procedures;
- Verify systems installation and operational performance;
- Maintain a Commissioning Issues and Resolution Log throughout the Commissioning process;
- Prepare and submit a Commissioning Report;
- Verify operator and occupant training delivery and effectiveness;
- Prepare, update, submit, and comply with the Systems Manual;
- Review SFMTA O&M Facilities operations 10 months after Substantial Completion;
- Development of an Ongoing Commissioning Plan; and
- Prepare a final Commissioning Report.

## 6.6.2. Pre-Construction Requirements

### 6.6.2.1. Commissioning Plan

The preparation and contents of the Commissioning Plan shall follow the requirements of ASHRAE Standard 202-2018.

Principal Project Company shall prepare and submit to the City for its review and approval no later than NTP2 a Commissioning Plan to evaluate and document that the design, construction, and operation of the Commissioned Systems comply with the Contract Documents. The purpose and intent of the Commissioning Plan is to ensure:

- (a) the planning, design, construction, and operational processes have achieved their intended outcome;
- (b) the continued efficient operation of the Infrastructure Facility during the IFM Period;
- (c) all participants follow an approved plan to ensure the completed Infrastructure Facility will realize its intended level of comfort for Project users;
- (d) all stakeholders in the Infrastructure Facility understand their responsibilities for Commissioning activities;
- (e) all Project users will be familiar with the Infrastructure Facility and will understand their continuous role in its efficient operation; and
- (g) the intended LEED NC Gold Certification for the Infrastructure Facility can be achieved and that LEED EBOM Gold Certification can be maintained through the IFM Period.

The Commissioning Plan shall include, at a minimum, the following information:

- Overview of the Commissioning activities developed specifically for the Project;
- Roles and responsibilities for the Commissioning Team throughout the Project;
- Documentation of general communication channels, including the distribution of the Commissioning Plan during the design and construction process;
- Detailed description of Commissioning activities that will occur between NTP2, Substantial Completion, and Final Acceptance;
- A schedule of activities and site visits, including any key meetings between Principal Project Company, City, and CxP;
- Project design documentation evaluation procedures;
- List of documents and materials to be provided for review by the D&C Contractor related to the Commissioned Systems;
- Guidelines and format that will be used to develop the Commissioning documentation, including Systems Manuals and training plans;
- List and format for design review's, checklists and testing forms, Commissioning Issues and Resolution Log, and Commissioning progress reports that will communicate and track critical Commissioning activities information;
- List of Commissioned Systems and description of evaluation procedures;
- A description explaining how the activities in the Commissioning Plan will verify the Commissioned Systems performance against the Contract Documents and the Infrastructure Facility's readiness for operations; and
- The process and procedures for whenever Commissioning evaluation does not comply with the Contract Documents

### **6.6.2.2. Review of Design Documentation**

The CxP is required to conduct a design review, similar in rigor to a peer review, of the BODR, specifications, and design drawings at the following proprietary design review stages (see Section 1.8.5 of Division 1 of the Technical Requirements):

- i. At completion of 100% Design Development stage; and
- ii. During the 90% Construction Documents stage.

This review shall assess the adherence of the design to the Contract Documents and any highlight any potential issues with meeting the intended performance of the Infrastructure Facility.

Evidence of these design reviews shall be documented, at a minimum, in the Commissioning Issues and Resolution Log.

In addition to the Commissioning Issues and Resolution Log, for each round of design review, the CxP shall prepare and submit to Principal Project Company a design review memorandum addressing:

- List of the documents reviewed;
- Laws, standards, and guidelines used to perform the review; and
- A summary of the review flagging and describing major issues discovered.

The CxP shall submit the design review memorandum and Commissioning Issues and Resolution Log to Principal Project Company, no more than two weeks after the Design Deliverables are submitted for City review. Principal Project Company shall review the comments and respond to each item with acceptance or a response to the comment. All the comments shall be settled by Principal Project Company, D&C Contractor, and CxP. A workshop(s) between the D&C Contractor, Principal Project Company and/or CxP may be held to discuss any comments requiring clarification or discussions or decision by Principal Project Company. The CxP can chair these workshop(s).

Any CxP reviews of design documentation prior to NTP 2 may take place before or during the preparation of the Commissioning Plan.

### **6.6.2.3. Commissioning Issues and Resolution Log**

Throughout the Commissioning process the CxP shall develop and maintain a Commissioning Issues and Resolution Log where deviations from the Contract Documents, system and component performance are identified and their resolution documented. The log shall identify, for each discipline in the Commissioning scope, the number of open issues, issues closed, and issued still pending, and shall be updated until final correction is made, verified, and closed.

The Commissioning Issues and Resolution Log shall be tabulated with the following information provided for each comment:

- Comment number;
- Comment date;
- Author;
- Referenced document, system, assembly, or equipment;
- Description of the issue;
- Reason for the comment (e.g. code compliance, coordination, operational impact.);
- Criticality of the issue; and
- Status of the issue (open, pending, closed)

The Commissioning Issues and Resolution Log shall be accessible at all times to Principal Project Company and the City.

#### **6.6.2.4. Training Requirements for Commissioned Systems**

Principal Project Company shall establish training requirements in the Commissioning Plan for Principal Project Company personnel involved in the operation, maintenance, safety, and quality-related activities of Commissioned Systems. The Commissioning Plan shall include recommended training procedures, materials, and records to ensure that the skills and professional judgment of Principal Project Company personnel are developed appropriately for their intended roles before Substantial Completion.

The CxP shall review and comment on any planned training as it relates to Commissioned Systems.

#### **6.6.3. Construction Requirements**

##### **6.6.3.1. General**

The CxP shall be responsible for the following:

- Coordinate and conduct all Commissioning activities as described in the Commissioning Plan in a logical, sequential, and efficient manner using consistent protocols and forms, centralized documentation, clear and regular communications and consultations with all parties, frequently updated timelines and schedules, and with technical expertise;
- Coordinate the Commissioning work with the D&C Contractor and their subcontractors and the Construction Manager and ensure that the Commissioning activities are being scheduled into Project Schedule;
- Revise, update and augment the Commissioning Plan in accordance with the requirements and format of ASHRAE standards and guidelines, as necessary;
- Coordinate and conduct the Commissioning kick-off meeting with the Commissioning Team within 60 days of NTP2 and issue meeting minutes;
- Review all Requests for Information (RFI) and change orders applicable to the Commissioned Systems for impacts on Commissioning and the Contract Documents.

##### **6.6.3.2. Submittals Review**

During construction the CxP shall review the Submittals stated in the Commissioning Plan as well as any construction Submittals generated by the D&C Contractor related to Commissioned Systems to verify compliance with the Contract Documents. The CxP shall enter all Commissioning Submittal reviews in the Commissioning Issues and Resolution Log. At a frequency determined by the Commissioning Plan, the CxP shall prepare and submit to Principal Project Company a Submittal review memorandum addressing:

- List of the documents reviewed;
- Codes, standards and guidelines used to perform the review; and
- A summary of the review flagging and describing major issues discovered.

The CxP shall notify Principal Project Company of any reviewed submittals that the CxP deems not to meet the requirements of the Contract Documents.

### 6.6.3.3. Site Visits/Field Observations

Throughout the D&C Period the CxP shall perform site visits as necessary to observe component and system installations. At a minimum, the CxP shall perform one site visit every two months during building construction.

If the CxP finds any work to be incomplete, inaccessible, incorrect, or non-functional, the CxP shall make note of deficiencies and report the deficiencies in writing to Principal Project Company and Construction Manager for remediation before system start-up work proceeds.

After each visit the CxP shall record noted deficiencies in the Commissioning Issues and Resolution Log.

Before system start-up begins, the CxP shall coordinate and perform a final installation verification audit with Principal Project Company and the Commissioning Team. The audit shall include a check of:

- Piping specialties including cleaning, flushing, hydrostatic testing, balance, control, and isolation valves;
- Ductwork specialty items including turning devices; balance, fire, smoke, and control dampers; and access doors;
- Control sensor types and locations;
- Identification of piping, valves, starters, gauges, thermometers, etc.;
- Documentation of pre-start-up tests performed, including manufacturers' factory tests;
- Circuit breaker settings;
- Maintenance accessibility to equipment; and
- Review HVAC (Air and water) pressure, leakage test procedures and flushing and witness their execution sufficient to be confident that proper procedures are being followed.

The CxP shall include all testing documentation in the Commissioning Report.

### 6.6.3.4. Pre-Functional Checklists and Start-up

The CxP shall provide a documented means to verify that equipment has been installed, and start-up has been completed in conformance with the Contract Documents and manufacturer's installations instructions.

Develop an enhanced start-up and initial systems checkout plan for equipment selected to be commissioned. The start-up and checkout results shall be clearly documented according to the manufacturer's written instructions and the Contract Documents.

1. A pre-functional and start-up checklist shall be developed by the CxP for each piece of commissioned equipment and shall include all required checks (mechanical, testing, adjusting and balancing (TAB), electrical and plumbing). The checklist shall be customized for the Project and refer to specific Contract Documents and manufacturer installation requirement as well as applicable codes and regulations;
2. Each checklist shall include a detailed points list and detailed control systems operation and calibration checks to ensure the building automation system (BAS) is fully checked, calibrated, and tested.

The pre-functional checklists are made up of the following:

1. **Equipment data:** Used to capture information that a maintenance management system would typically require. For example: tag number, make, model, serial number and location.

2. **Nameplate data:** Used to validate that the proper piece of equipment has been installed. Check to ensure that the installed equipment matches the approved equipment, use static information captured from the equipment nameplate as specified, as approved and as installed.
3. **Installation data:** Used to verify that the equipment has been properly installed and is a quality control check on the installation. Each check on the checklist shall be referenced to the Contract documents (specification section, drawing and specific detail) or manufacturer installation instruction specific page number.
4. **Start-up data:** Used to confirm that the equipment has been started in accordance with the manufacturers and specified requirements. Develop an enhanced start-up and initial systems checkout plan with contractors for equipment selected in the contract documents. The start-up and checkout results shall be clearly documented according to the manufacturer's written instructions and the Contract Documents.

The CxP shall verify/sample up to 10 percent of the D&C Contractor completed checks using randomly selected completed pre-functional checklists and report the results back to Principal Project Company. If the 10 percent sample fails, the D&C Contractor shall make the necessary corrections to all checklists and resubmit. The CxP shall then verify 20 percent of the resubmitted pre-functional checklists.

#### **6.6.3.5. Testing, Adjusting and Balancing (TAB) Verification**

The purpose of the HVAC TAB review is to verify the accuracy of the TAB work prior to commencing any functional performance test (FPT) activities that may be adversely affected by improper balancing. The CxP shall advise the D&C Contractor when systems are complete and ready for balancing, typically after the pre-functional checks are verified and accepted.

The CxP shall randomly sample the TAB report generated by the D&C Contractor and verify the system performance is accurately documented. This sample shall consist of 10 percent of documented measurements to verify and validate the reported results and reporting methods used. If significant issues are identified during the 10 percent verification, the D&C Contractor shall need to completely rebalance those systems as well as other similar systems and generate a revised TAB report, which shall be re-verified by the CxP.

To minimize any rework, the CxP may require that the D&C Contractor submit a customized TAB plan and procedures as required by the specifications prior to commencing TAB work. The CxP shall review the plan and meet with the D&C Contractor beforehand and discuss their approach to balancing the Project and provide guidance and assistance as needed. Results of review and meeting shall be documented.

Acceptance of TAB work by the CxP is a pre-requisite for starting Functional Performance Testing (FPT).

#### **6.6.3.6. Functional Performance Testing (FPT)**

During the acceptance phase of the Commissioning process, the CxP shall review the D&C Contractor's sequence of operations and clarify aspects and requirements that are ambiguous, incomplete, or not included. Where necessary the CxP shall rewrite the sequence in a format and language that help facilitate the writing of the program by the D&C Contractor. This sequence shall be used for testing. In the case where the FPT has been identified as failing the expected outcomes, the CxP shall allow for at least one re-test during the Commissioning process.

The CxP shall prepare FPT procedures for equipment and systems, using written, repeatable test procedures that are used to functionally test each system and assemblies. These tests shall be documented to clearly describe the individual systematic test procedures and the expected system response or acceptance criteria for each procedure.

Prior to testing, the CxP shall distribute the written procedures to be used during the test for review and pre-testing by the D&C Contractor.

The CxP shall also use the building management system control monitoring and historical data storage and trending capability to verify that the performance of the Commissioned Systems is achieved under varying load conditions throughout the building.

Functional performance testing (testing) shall address 100 percent of the Commissioned Systems. The CxP shall record all passes, failures, and deficiencies in the Commissioning Issues and Resolution Log. Failures and deficiencies shall be addressed by Principal Project Company and retested.

For HVAC systems specifically, the CxP shall:

- test the systems in automatic and normal mode (temperature, volume and pressurization control as well as of operations recovery after failure);
- test the systems in other significant modes, sequences, and control strategies including start-up, shutdown, unoccupied mode, manual mode, equipment component staging and backup upon failure (including air handling units, terminal boxes, fan coil units, fans, boilers, chiller, cooling towers, pumps, etc), modulation up and down of the unit's range of capacity, miscellaneous alarms, power failure, security alarm when impacted, and interlocks with other systems or equipment; and
- simulate high demand, off-season or unoccupied conditions through control system manipulation to verify proper system response and coordinated control, including alarms generation, operating and safety control functions.

For lighting systems specifically, the CxP shall verify and document configuration and calibration with all interior and exterior lights and lighting control equipment, which shall include but may not be limited to:

- occupancy sensors and daylight photocells, specifically, sensor location, sensitivity and time out settings suited for the application;
- verify and commission the system with the appropriate equipment, for example a light meter; and
- verify the lighting systems work in coordination with any building daylighting control systems.

The Principal Project Company shall be responsible for providing temporary network switches to enable IT / Comms system testing and any other testing. The City is not obligated to install its permanent network switches until after Substantial Completion but may do so earlier if the Project Schedule and Work progress allow and Principal Project Company agrees.

For clarity, the CxP shall not perform any of the testing required in this section and the CxP's actions shall not relieve Principal Project Company from any of Principal Project Company's obligations under the Agreement.

#### **6.6.3.6.1. FPT Noticing and Results**

Under the direction of the CxP, appropriately qualified personnel of Principal Project Company shall implement all testing as set forth in the Commissioning Plan. Principal Project Company shall give the City a minimum of 30 days' notice as to when the testing will begin and shall invite the City to witness and to comment on each aspect of the testing up until all testing is fully complete. Principal Project Company shall, together with such notice to the City, provide all information the City may reasonably require in relation thereto, including: (i) tests proposed; (ii) test methodology; and (iii) expected test results. The City shall be provided with full and reasonable access to all Commissioning activities to ensure the City remains fully informed of the process.

Within 15 Business Days following the last day of testing performed pursuant to this Section, Principal Project Company shall provide the City with testing results, certified as true, complete and correct by Principal Project Company.

#### **6.6.3.7. Commissioning Report**

After work described in Sections 6.5.3.1 through 6.5.3.6 above have been completed, the CxP shall tabulate and assemble all relevant findings and results into a Commissioning Report. Principal Project Company shall submit the Commissioning Report to the City for review and approval before Substantial Completion can be achieved.

The Commissioning Report shall include the following:

- A summary of Commissioning Plan including lists of participants and their role, building description, overview of the Commissioning scope, and a general overview of the testing and verification methods used;
- Description of Commissioning process benefits and results of the Commissioning process;
- A summary of the design review process;
- A summary of Submittal review process;
- A complete description of all FPT procedures, results and evaluation;
- An up-to-date and complete Commissioning Issues and Resolution Log with all entries resolved, plans for resolving any outstanding issues; all Commissioning activities to occur past Substantial Completion shall be clearly identified (if applicable);
- A clear, written confirmation that all failures or deficiencies in the Commissioning Issues and Resolution Log have been resolved;
- Clear, written confirmation that the individual systems and assemblies listed in Section 6.4 of this Division 6 meet the Contract Documents and that the Infrastructure Facility is ready for operations;
- Operations and maintenance materials (see Section 6.5.3.8 for requirements);
- Written evaluation of conducted training noting any further training needs or gaps; and
- Plan for resolution of any outstanding Commissioning-related issues

The Commissioning Report shall also include the following documentation as attachments:

- BODR;
- all design review and submittal review memoranda;
- Commissioning Plan;
- Meeting notes;
- Training records;
- Executed Pre-Functional Checklists;

- Start-up reports; and
- Trend logs.

#### **6.6.3.8. Operation and Maintenance Materials**

Principal Project Company shall ensure the IFM Provider and the City receive the following for information no later than Substantial Completion in accordance with ASHRAE Guideline 4, 2019 to enable efficient building operations and better ensure the results of Commissioning activities persist over time:

- A sequence of operations for the Infrastructure Facility;
- The Infrastructure Facility occupancy schedule;
- The equipment run-time schedules;
- The setpoints for all HVAC equipment;
- The lighting level settings throughout the building;
- The minimum outside air requirements;
- Any changes in schedules or setpoints for different seasons, days of the week, and times of day;
- A systems narrative describing the mechanical and electrical systems and equipment;
- A preventive maintenance plan for building equipment described in the systems narrative; and
- A Commissioning program that includes periodic Commissioning requirements, ongoing Commissioning tasks, and continuous tasks for critical facilities.

#### **6.6.4. Post Substantial Completion Requirements**

##### **6.6.4.1. Systems Manual**

The CxP shall prepare the Systems Manual for the Project in accordance ASHRAE Guideline 0–2019, Annex O. The Systems Manual shall include all the information necessary to operate, maintain, and re-commission all energy and water-consuming systems within the Infrastructure Facility. By its nature, the Systems Manual will be a collection of materials already produced by Principal Project Company, the D&C Contractor, or the CxP. Principal Project Company shall submit the Systems Manual to the City for review and acceptance no later than 180 days after Substantial Completion.

At a minimum the Systems Manual shall include the following:

- Executive summary;
- BODR;
- System single-line diagrams;
- Construction record documents and specifications;
- Approved submittals;
- As-built drawings;
- As-built sequence of operation;
- Original setpoints for all systems commissioned;
- Recommended schedule for recommissioning;
- Recommended schedule for sensor recalibration;
- Equipment operations and maintenance manuals;
- Equipment preventive maintenance schedules;
- Confirmation of completed training for IFM Provider and City personnel;

- Ongoing system optimization procedures; and
- Final Commissioning Report.

#### **6.6.4.2. Post Occupancy Review of Building Operations**

For purposes of complying with LEED Enhanced Commissioning and building envelope commissioning requirements, starting no later than 10 months after Substantial Completion, the CxP shall:

- review with Principal Project Company the current building operation and condition of outstanding issues and occupancy concerns related to the Contract Documents;
- interview the IFM Provider and SFMTA staff to identify problems or concerns they have with operating the Infrastructure Facility as originally intended and provide suggestions for improvements and record the changes in the Systems Manual;
- identify problems that are covered under warranty or under the original D&C Contract and make suggestions for improvements; and
- assist Principal Project Company and SFMTA staff in developing reports, documents.

The CxP shall provide written documentation to Principal Project Company on how to resolve outstanding Commissioning related issues within one (1) year after the Substantial Completion date to develop a final deficiency and action list. This documentation shall include requests for services to remedy outstanding problems. Principal Project Company shall provide the written documentation to the City for information.

Confirm execution of Monitoring-Based Commissioning (MBCx) plan, including:

- The review of metering and trend logs;
- The review the issues log showing results of the MBCx;
- Confirmation of the issues resolutions;
- Confirmation of ongoing operator training; and
- Update the Systems Manual with any modifications or new settings that differ from design, with explanations for the changes.

#### **6.6.4.3. Near Warranty End Post Occupancy Review**

Specifically for SFMTA O&M Facilities and certain Equipment List items, starting no later than 10 months after Substantial Completion, Principal Project Company shall:

- interview the SFMTA staff to identify problems or concerns they have with operating SFMTA O&M Facilities and certain Equipment List items as originally intended and provide suggestions for improvements and record the changes in the System Manual; and
- identify problems that are covered under warranty or under the original D&C Contract and implement improvements.

The PPC shall, one (1) year after the Substantial Completion date, provide written documentation to the City describing what was learned through interviews and investigations into performance of SFMTA O&M Facilities and certain Equipment List items, how issues will be resolved through warranties or other means, and develop a final deficiency and action list. This documentation shall include requests for services to remedy outstanding problems. Principal Project Company shall provide the written documentation to the City for information.

#### **6.6.4.4. On-going Commissioning Plan**

For purposes of complying with LEED Enhanced Commissioning and building envelope Commissioning requirements, the CxP shall produce and submit to Principal Project Company an Ongoing Commissioning Plan no later than one year after the Substantial Completion Date. The plan shall provide the Infrastructure Facility operating staff with procedures, blank test scripts, and a schedule for ongoing Commissioning activities.

The Ongoing Commissioning Plan shall include the following:

- The definition of the ongoing Commissioning process;
- Defined roles and responsibilities;
- Recommended schedule for recommissioning as-built systems;
- Continuous documentation and updating of Infrastructure Facility's operating plan to meet the requirements of the Contract Documents throughout the building's lifetime;
- Blank testing materials, including functional performance tests for all commissioned as-built systems in the building, as well as an issues log; and
- Direction for testing new and retrofitted equipment.

#### **6.7 Monitoring-Based Commissioning (MBCx)**

For purposes of complying with LEED Enhanced Commissioning and building envelope Commissioning requirements, Principal Project Company shall develop Monitoring-Based Commissioning (MBCx) procedures and identify points to be measured and evaluated to assess performance of energy- and water-consuming systems. MBCx requirements shall be included in the Commissioning Plan and shall address the following:

- Defining roles and responsibilities;
- Measurement requirements (meters, points, metering systems, data access);
- The points to be tracked, with frequency and duration for trend monitoring;
- The limits of acceptable values for tracked points and metered values (where appropriate, predictive algorithms may be used to compare ideal values with actual values);
- The elements used to evaluate performance, including conflict between systems, out-of-sequence operation of systems components, and energy and water usage profiles;
- An action plan for identifying and correcting operational errors and deficiencies;
- Training to prevent identified errors; and
- Planning for repairs needed to maintain performance.

In addition, the MBCx requirements in the Commissioning Plan shall:

- Define analysis procedures, including the frequency of MBCx-related analyses in the first year of occupancy (at least quarterly);
- Outline the evaluation process and determine the procedure for handling system conflicts, usage profiles, and out-of-sequence operations;
- Include preventive planning and maintenance procedures necessary to meet performance goals; and
- Determine measurement requirements and decide whether predictive algorithms can be used in conjunction with metered points.

Principal Project Company shall work with the CxP to ensure that requirements for MBCx are included in all Commissioning-related documents, including:

- specific trends to track in the BODR;
- Metering and monitoring required for MBCx;
- Single-line or riser diagrams for location of building and system meters in the design submittals;
- Controls sequences for specification of appropriate monitoring points in the design submittals;
- Submittal reviews of meters, energy analysis software, and drawings of controls for compliance with Principal Project Company's MBCx metering and monitoring requirements;
- Creation and completion of pre-functional tests for MBCx-related equipment, such as meters and energy analysis software programs; and
- IFM Provider educational materials regarding measurement techniques, energy analysis software tools, and fault detection and fault resolution, are incorporated into training documentation for the IFM Provider.

After MBCx activities are complete, the CxP shall update the Systems Manual with any modifications or new settings and give the reason for any modifications from the original design. Principal Project Company shall submit any revised Systems Manual to the City and the IFM Provider.

## **6.8 Operational Readiness (OR)**

Principal Project Company acknowledges that the City will be preparing for day one performance of the SFMTA O&M Services (see Section A.2.1.2 of Division 7). The City requires Principal Project Company support to ensure SFMTA staff are ready to perform the SFMTA O&M scope of work.

Principal Project Company shall develop and implement a process with the City for transitioning from construction to full operation and achieving day one operational success operating the equipment and facilities related to SFMTA O&M Services. This process may be termed in a variety of ways, including but not limited to ensuring 'operational readiness.'

Principal Project Company, in consultation with and with contributions from the City and selected stakeholders, shall develop an integrated Operational Readiness Plan that details:

- Stakeholder engagement plan;
- Operational readiness governance structure and points of contact;
- Schedule for all familiarization, maintenance, and operational training consistent and coordinated with other training requirements in the Technical Requirements;
- Proving trial program for all; and
- Handover and post-transition support plan that includes success factors for day one operations

[The City shall provide Principal Project Company with SFMTA Bus Yard Standard Operating Procedures (SOPs) that describe the intended City operations and process flows in the Infrastructure Facility. Principal Project Company shall review the SOPs and shall check for alignment or conflict with Principal Project Company's operations and design documents.] The City will identify and provide contact information for SFMTA's operational readiness and transition team members.

Principal Project Company shall prepare the Operational Readiness Plan and submit it to the City for review and approval no later than 180 days prior to the scheduled Substantial Completion Date. Principal Project Company shall amend and reissue the plan if changes are required. All activities in the Operational Readiness Plan shall be either: (1) completed no later than the Substantial Completion Date; or (2) completed after the Substantial Completion Date as part of the Bedding-In Period activities.

Principal Project Company shall allow for appropriate engagement with designated City staff in the implementation of the Operational Readiness Plan. This shall be accomplished through an Operational Readiness Working Group (ORWG) comprised of Principal Project Company and City staff, and other stakeholders as appropriate. The ORWG shall communicate closely with the [Transition Committee] (see Section [B-25] of Division 7 of the Technical Requirements) and ensure the Operational Readiness Plan is coordinated with the Bedding-In Period and move-in activities and schedule.

Principal Project Company shall provide a dedicated Operational Readiness Point of Contact (OR POC) during the operational readiness period. This Point of Contact shall participate in operational readiness governance and the ORWG, and shall be responsible for coordinating and implementing the Operational Readiness Plan with the ORWG. Specifically, the Point of Contact shall be responsible for coordinating the provision of resources to support Operational Readiness activity, any rectification needs, and act as liaison between the ORWG and the other stakeholders onsite such as the D&C Contractor and the CxP.

The ORWG shall be formed no later than 270 days prior to scheduled Substantial Completion Date and shall initially meet on a monthly cadence to contribute to, review, comment on, and complete the Operational Readiness Plan. However, to be specified in the Operational Readiness Plan, it is anticipated that meeting frequencies will increase as the transition date nears. It is anticipated that during the trial period meetings will be weekly with go-no-go calls the day prior to every trial. In the countdown period immediately prior to transition the ORWG will likely need to meet daily.

Operational Readiness stakeholders, including the ORWG, will require access to the Project Site prior to Substantial Completion to plan for operations, transition and perform early trials. Principal Project Company shall facilitate the City's and other stakeholder's safe and secure site access and to manage this process, noting the control of the site.

Principal Project Company shall provide input on the Operational Readiness assessment and ensure that building systems and equipment necessary to support scheduled trials will be ready. Principal Project Company shall make allowance for safe access to such areas within the site as necessary to facilitate the City's transition team and SFMTA operational staff as necessary to allow a successful transition to the facilities becoming operational.

Principal Project Company shall fully engage with the City's transitioning team and shall allow for provision of a full and effective handover. This will include timely provision of the Systems Manual and any other necessary documentation to allow the transition to take place.

Principal Project Company shall support the City with post-opening support as required and requested by the City. This may include systems hand-holding support, snagging, and lessons-learned sessions.

# Definitions

[Note: All terms have been moved to Exhibit 1 (Abbreviations and Definitions) of the DBFOMA.]

## Section A - Introduction

### A.1 Guiding Principles

- (1) The IFM Services detailed within these IFM Specifications form various aspects of what is expected to be a fully integrated and coordinated service. PPC will integrate and coordinate each IFM Service with all other services to provide an integrated and complete service solution.
- (2) While the IFM Services are described by their traditional functional titles, City encourages innovative approaches and task configurations to support maximum effectiveness in service delivery in supporting the continuous operation of the Infrastructure Facility in its delivery of services such that there is a minimized impact on the delivery of the IFM Services or risk to Building Occupants and the surrounding community.
- (3) This document describes the IFM Services that PPC is required to provide throughout the IFM Period.
- (4) These obligations are organized into IFM Services categories.
- (5) These IFM Specifications do not necessarily list all of the activities and steps that PPC must perform in order to fulfil the requirements for the Infrastructure Facility. PPC shall tailor its solutions and services to these requirements.

### A.2 City/ PPC Division of Responsibilities

Pursuant to Division 1 (General Provisions) of Exhibit 18 Technical Requirements, this document outlines the responsibilities as between PPC and the City related to the Infrastructure Facility consisting of the Bus Yard and Common Infrastructure.

This section is a brief overview of responsibilities and is meant to be read in conjunction with the rest of the document and other related documents outlining scope and responsibility. It is not meant to be all inclusive.

#### A.2.1.1. IFM Services

IFM Services Item	Description
<b>Building Systems</b>	
Structural system	PPC is responsible for the complete structural system of the BYC and the Common Infrastructure (i.e., the Infrastructure Facility). This encompasses the portions of the vertical and lateral structural system of the BYC needed to support the HCC. This includes: (a) the BYC's roof structure supporting the HCC over it; (b) the vertical structure and complete foundations system; and (c) the BYC's complete lateral force resisting system including foundations, collectors, etc.

IFM Services Item	Description
Building Envelope	PPC is responsible for the complete exterior envelope of the entire Infrastructure Facility, including cladding, waterproofing, and insulation. The building envelope includes the waterproofing system of the roof structure supporting the HCC over the podium.
Demising walls separating the BYC from the HCC	<p>If PPC’s approach for the Project provides demising walls that are designed and constructed as a single wall assembly, then demising walls will be considered to be part of the Common Infrastructure for which PPC has responsibility.</p> <p>If PPC’s approach for the Project provides demising walls that are designed and constructed as two separate and independent wall assemblies – one facing the BYC and the other facing the HCC –, then each will be considered to be part of the corresponding Project component and PPC shall have responsibility for the wall assembly directly facing the BYC.</p>
Signage and Wayfinding	PPC is responsible for all signage and wayfinding components for spaces allocated to the Common Infrastructure
Building mechanical, electrical, and plumbing systems and common utility systems	<p>PPC is responsible for the complete HVAC, plumbing, electrical, lighting, fire and life safety systems, MEP system controls, and Building Automation System serving the Infrastructure Facility. The MEP systems include hot and chilled water physical plants, electrical distribution systems, and backup power systems. The Compressor Equipment System shall also be PPC’s responsibility.</p> <p>If PPC’s approach for the Project includes common Utility systems for the Facility as a whole, as described in Division 4 (Supplementary Design Criteria) of Exhibit 18 (Technical Requirements), then the common utility systems will be part of the Common Infrastructure for which PPC is responsible. In this case, they will include the Facility-wide Building Management System.</p>
Fire and life-safety systems	<p>PPC is responsible for fire and life-safety within the Infrastructure Facility.</p> <p>If PPC’s approach for the Project includes an integrated Facility-wide fire and life-safety system, then the fire and life-safety system will be considered part of the Common Infrastructure for which PPC is responsible. In this case it will include the Facility-wide fire and life-safety control systems. This includes annunciation (speakers) and fire protection devices (alarms, detectors, sprinklers heads and extinguishers)</p>
Information Technology, Communications, and Security Systems	For IT, communication, and security systems, PPC’s responsibilities will be according to the scope of work allocation defined in Table 5 and Table 6 of Appendix A of Division 1 (General Provisions) of Exhibit 18 Technical Requirements.
Civil and Utility Systems	For civil and Utility systems, the IFM Services will be for the full Infrastructure Facility according to the scope of work allocation defined in Section 2.1 (Common Infrastructure) of Exhibit 18 (Technical Requirements).
<b>Building Spaces</b>	
Building system spaces	PPC is responsible for rooms for civil and Infrastructure Facility Utility systems, MEP systems, and/or common Utility systems that are allocated to the Common Infrastructure as described above and as described in <u>Section 2.1 (Common Infrastructure)</u> of Exhibit 18 (Technical Requirements).

<b>IFM Services Item</b>	<b>Description</b>
Vertical circulation	PPC is responsible for all stairs, emergency egress, escalators, and elevators in the Infrastructure Facility that have shared uses for each PPC component as described in <u>Section 2.1</u> (Common Infrastructure) of Exhibit 18 Technical Requirements. This includes all the shared mechanical and electrical systems for vertical conveyance.
Common-use spaces	PPC is responsible for all common use enclosed or open spaces (whether public or private, including the podium roof open space), shared entrance lobbies, shared restrooms (whether public or private), and shared service areas (e.g., loading docks, storage spaces, waste handling facilities) as described in Section 2.1 (Common Infrastructure) the Exhibit 18 (Technical Requirements).
<b>Public right-of-way improvements</b>	
Public Right-Of-Way Improvements	PPC is responsible for all specialty paving and public sidewalks, but excluding bike racks, and exterior signage included in the Project to meet the Technical Requirements.

### A.2.1.2. SFMTA O&M Services

<b>SFMTA O&amp;M Services</b>	<b>SFMTA O&amp;M Facilities</b>
Transit vehicles	City is responsible for O&M and lifecycle of City buses and Non-Revenue Vehicles.
Maintenance and Transit Spaces and FF&E	City is responsible for O&M and lifecycle of the maintenance bays, shops, and transit vehicle maintenance equipment; specifically, any space or equipment used solely in connection with the SFMTA O&M Services. This includes all Maintenance and Transit Spaces and includes management of replacement parts inventory. Includes O&M of the FF&E installed and used in these spaces, excluding the Compressor Equipment and System that will be the responsibility of PPC.
Transit vehicle traction power systems	City is responsible for O&M and lifecycle of the trolley bus OCS
Transit communication, security, and IT systems	City is responsible for IT, communication, and security systems, the SFMTA O&M Services will be according to the scope of work allocation defined in Table 5 and Table 6 of Appendix A of Division 1 (General Provisions) of Exhibit 18 Technical Requirements.
Office / Admin and Training Spaces and FF&E	City is responsible for O&M and lifecycle of Office / Admin and Training Spaces including Office / Admin and Training Spaces FF&E.
Ancillary facility services	City is responsible for O&M and lifecycle activities related to the BYC such as custodial, building security, uniforms, catering, and other such services that the City customarily performs in its existing transit maintenance and storage facilities.

### **A.2.1.3. City Responsibility**

For clarity, within the Maintenance and Transit Spaces and the Office / Admin and Training Spaces, the following are the responsibility of the City where the City is responsible for O&M and lifecycle in accordance with Section A.A.2.1.2:

- All City equipment used for bus operations or bus maintenance.
- AV equipment and related cabling, mounting hardware, etc.
- All Ethernet and Wi-Fi equipment, cabling, etc.
- Appliances (refrigerators, microwaves, dishwashers, coffee machines.)
- Wall finishes (panels, drywall, paint, moldings).
- Ceiling (suspended from the floor slab. Any kind, whether finished drywall or suspended, including HVAC grills).
- Flooring (any finishes on top of the concrete floor slab, including epoxy finish).
- Doors (including hinges, locks, door closers, door stops, handles, etc. on both sides of the door).
- Light fixtures, ballasts, bulbs, including emergency lights.
- Outlets and switches in the walls, including ethernet, cable, electrical, AV)
- Plumbing fixtures, including shut off's and piping from shutoff to fixtures.
- Ventilation grills.
- Millwork (cabinets and counter tops, lockers, built-in furniture)

### **A.2.1.4. PPC Responsibility**

The PPC is responsible for O&M and lifecycle of spaces which is not City's under Section A.2.1.3 and as otherwise defined in Appendix D ("PPC Spaces") in accordance with Section A.2.1.1.

## Section B - General Requirements

### B.1 Overview

- (1) Read in conjunction with the entirety of the Agreement, these IFM Specifications set out the requirements for the IFM services to be provided by PPC during the IFM Period.
- (2) These IFM Specifications include all Maintenance Services required to ensure the Maintained Elements meet the Performance Requirements and to ensure that the Infrastructure Facility remains operational throughout the IFM Period.
- (3) PPC shall provide all services that are required to ensure the integrity of the Infrastructure Facility during the IFM Period.
- (4) The IFM Services detailed within these IFM Specifications form various aspects of what is expected to be a fully integrated and coordinated service. PPC will integrate and coordinate each Service Category with all other Service Categories to provide an integrated and complete facilities management solution.
- (5) PPC shall deliver IFM Services to the required standards, including the following:
  - (a) Provide all IFM Services 24 hours per day, 365(6) days per year as required.
  - (b) Fully integrated, coordinated, and organized IFM Services to provide an integrated, comprehensive facilities management solution for City.
  - (c) Services, materials, repairs, replacements, and renewals at a minimum to meet the standards outlined in this section and the Technical Requirements.
  - (d) Maintain a safe, compliant, functional working environment at the Infrastructure Facility.
  - (e) Provide all parts, materials, supplies, systems, and other components in new condition unless prior written consent is received from City.
  - (f) Provide integrated, high quality, efficient, innovative, and flexible IFM Services at all times to achieve the Technical Requirements.
  - (g) Maximize efficiency of and minimize disruption to SFMTA O&M Services.
  - (h) Provide a full audit trail of activities involved in delivery of the IFM services.
  - (i) Implement improved techniques, procedures, materials, supply, and service delivery methods in keeping with leading practices in facilities management over the Term.
  - (j) Cooperate with City in their planning and management of special events or visits by guests of City.

- (6) Where the term “free from” is used, the service requirement will be to ensure that the equipment, component, or finish is maintained in accordance with Good Industry Practices for similar facilities.

## **B.2 Comprehensive Service**

- (1) PPC shall provide, purchase, deliver and install or implement, unless otherwise expressly provided, all requisite resources, services, supplies, consumables, parts, plant, equipment, apparatus, tools, or other materials required for the proper execution of all IFM Services and/or related services.
- (2) PPC acknowledges that there may be services or tasks to be performed that are not described in the Agreement, but are related or necessarily ancillary to the delivery of the IFM Services and these shall be performed by PPC as part of the IFM Services in accordance with the intent of this Section and as otherwise required by Good Industry Practice. PPC shall perform or provide those services as if they were included in this Section. This will not constitute additional scope of services.

## **B.3 Legislative Requirements**

- (1) PPC shall:
  - (a) Advise City of any orders, warnings or non compliance citations issued by any relevant Authority(ies) Having Jurisdiction that PPC becomes aware of, along with plans to rectify or address any related requirements imposed by the relevant authorities.
  - (b) Provide an annual report on permits, licenses and approvals associated with work conducted by PPC.
  - (c) Ensure the status on all statutory testing is reported to City on a monthly basis or otherwise as required by Applicable Law and Standards.

## **B.4 City Standards and Policies**

- (1) PPC shall adhere to City standards or policies, including Standards and Specifications, existing as at the Setting Date.
- (2) Changes in Standards and Specifications are subject to Section 7.2.4 of the Agreement.

## **B.5 Annual Service Plan**

### **B.5.1. Annual Service Plan**

- (1) PPC shall develop the Annual Service Plan in accordance with the items listed below at a minimum. PPC may include additional information as appropriate.

- (a) A brief narrative overview or executive summary of PPC's approach to delivery of the IFM Services.
  - (b) The plan for delivery and provision of each of the IFM Services, including upcoming procurement activities, changes, audits, etc. along with potential impacts to City.
  - (c) A detailed organizational and staffing plan for the upcoming Contract Year.
  - (d) Activities or initiatives that may cause disruption to Building Occupants and the methods and/or accommodations PPC will implement to minimize such disruptions.
  - (e) An analysis of past performance and upcoming changes to improve delivery of the IFM Services.
  - (f) Recommendations for changes to any joint service protocols and procedures between PPC and City.
  - (g) Any proposals for changes to IFM Services or the procedures that may impact SFMTA O&M Services.
- (2) The Annual Services Plan shall be reviewed and revised by PPC annually and re-submitted to City.

## **B.6 IFM Services Procedures**

- (1) IFM Services Procedures are intended to guide the on-going service delivery by PPC and their Contractors at the Infrastructure Facility.
- (2) PPC shall develop IFM Services Procedures for the service areas as outlined below, at a minimum, to provide IFM Services in accordance with the relevant sections of these IFM Specifications. These may be incorporated in PPC's overall procedure documentation and may be standard procedures, however all unique City requirements are to be addressed.
- (3) The IFM Services Procedures shall, at a minimum, include the following:
  - (a) General Management
    - i. Communications & Committee Procedures
    - ii. Human Resources
    - iii. Occupational Health and Safety/Risk Management.
    - iv. Quality Management Plan.
    - v. Periodic Reporting (process and templates)
    - vi. Performance Monitoring Program
    - vii. Help Desk Services.

- viii. Utilities Management Services
  - ix. Environmental Management System, relative to Environmental and Sustainability Services.
  - x. Emergency Management, including operational risk assessment
  - xi. Fire Management Plan.
- (b) IFM Project Site & Infrastructure Facility Operations
- i. Security Services
  - ii. Solid Waste Collection, Recycling, and Removal Services.
  - iii. Pest Control Services
  - iv. Grounds Maintenance Services.
  - v. Cleaning Services
  - vi. Maintenance Services
  - vii. Renewal Work Services.

### **B.6.1. IFM Services Procedures Submission Process**

- (1) For all IFM Services Procedures required under these IFM Specifications, PPC shall:
  - (a) Submit a schedule of Submittals required under these IFM Specifications at least ten (10) months prior to Substantial Completion Deadline, to commence no later than eight (8) months prior to Substantial Completion Deadline and the final submitted no later than one (1) month prior to Substantial Completion Deadline.
  - (b) Include in the schedule timelines for 2 drafts and 1 final version of each Submittal required under these IFM Specifications and be staggered, taking into account City resource requirements. Meetings to review the Submittals shall be included in the schedule.
  - (c) Identify in advance, requirements needed from City for information, additional meetings, and access to City subject matter experts, City procedures and other information needed by PPC to develop the IFM Services Procedures.
- (2) City will review the Submittals in accordance with Exhibit 11 (Submittals Review Process) of the Agreement and will provide comments to PPC for changes by PPC in the subsequent Submittals where they do not meet Good Industry Practice for facilities procedures, do not adequately demonstrate that the IFM Services Procedures will result in the IFM Services being delivered in accordance with these Contracts or otherwise as set out in the Submittal Review Process.

- (3) Regardless of City's comments and resulting changes, PPC retains full responsibility to ensure that its obligations are carried out in accordance with the Agreement.
- (4) The IFM Services Procedures shall be reviewed by PPC annually following the Substantial Completion Deadline and if changes are required, revised IFM Services Procedures are to be re-submitted to City for review.

## **B.7 Special Occasions, Visits and Events**

- (1) City will provide PPC with a list of planned special occasions and events planned which may impact the activities at the Facility and consequently, PPC activities that are required.
- (2) PPC shall lower and raise the flags at the times and on the days required based on instruction from City. These requirements will be based on local, state and federal protocols.
- (3) PPC shall make provision for and cooperate with City to prepare for visits by guests of City.

## **B.8 Human Resources**

### **B.8.1.1. Delivery organization**

- (1) Without limiting Article 9 of the Agreement, PPC Shall:
  - (a) Provide and have in place a delivery organization with sufficient qualified, trained and competent resources and related support to deliver the IFM Services.
  - (b) Introduce all resources to City and clearly identify roles and responsibilities, as well as reporting hierarchy.
  - (c) Have in place a policy and process for addressing employees or Contractor employees who do not follow City policy when on-Infrastructure Facility, including progressive discipline and possible release or re-assignment, including at the request of City acting reasonably.
  - (d) Have in place policies and procedures to deal with all human resources issues and in particular to be compliant with relevant City policies and procedures.

### **B.8.1.2. PPC Representative**

- (1) PPC shall provide an IFM Manager to represent PPC and manage IFM Services at the Infrastructure Facility. This representative (or qualified delegate) shall be available 24 hours per day/365(6) days per year and directly contactable by the City Authorized Representative.
- (2) The IFM Manager shall be in place at least 6 months prior to Substantial Completion Deadline and be involved in Move- In processes.

### **B.8.1.3. Infrastructure Facility Security Screening**

- (1) PPC shall ensure that all new staff do not commence work at the IFM Project Site until the results of a recent criminal record check and background screening have been provided and proved satisfactory to City.
- (2) PPC shall ensure any PPC employees or Contractor employees for whom these screenings are outstanding and who is required to perform IFM Services at the IFM Project Site shall be escorted and continually supervised by a PPC employee who has passed the criminal record check and whose background screening has been proved satisfactory to City.
- (3) City has the right, acting reasonably, to refuse access to the IFM Project Site to any individual failing to meet the City security clearance requirements, at any time during the IFM Period.

### **B.8.1.4. Work Wear and Attire**

- (1) PPC shall ensure that all PPC employees and Contractor employees shall be properly and presentably dressed and where required in appropriate uniforms and work wear including necessary personal protective equipment (PPE).
- (2) PPC employee or Contractor employees shall:
  - (a) Not wear articles of clothing or other accoutrements that express personal opinions or which others may find offensive or as harassment.
  - (b) Wear identification badges, in accordance with City security policies, which will at a minimum include the PPC authorized individual's photo, name and company name, at all times. The identification badges will be provided by PPC at their cost.
  - (c) Abide by City dress code and other policies as applicable.

### **B.8.1.5. Training and Qualifications**

- (1) In addition to orientation and OH&S training, PPC shall:
  - (a) Provide all employees with and ensure all Contractor employees are provided with training on their specific job responsibilities, duties, and tasks.
  - (b) Ensure that all employees and Contractors have up-to-date certification, training and qualifications related to their responsibilities.
  - (c) Ensure that all personnel providing IFM Services at the Infrastructure Facility hold the required professional designations or certifications to perform the work in accordance with the relevant Governmental Entity(ies).
  - (d) Maintain training records and certification records for each individual and provide to City as requested for review but in no case less than annually.

### **B.8.1.6. Infrastructure Facility Orientation**

- (1) All PPC employees and Contractor employees providing IFM Services at the Infrastructure Facility shall be provided with an orientation course prior to commencing work at the Infrastructure Facility. PPC shall provide orientation material to City for review and also provide an updated list of PPC employees and Contractor employees with confirmation of their orientation date. Orientation will include:
  - (a) PPC specific company orientation related to their position and responsibilities shall including at a minimum:
    - i. Job role descriptions, tasks and responsibilities.
    - ii. Reporting relationships for each job.
    - iii. Geography of the IFM Project Site and Infrastructure Facility.
    - iv. Interaction with lines of communication between PPC and City.
    - v. Knowledge of Applicable Law and Standards.
    - vi. Knowledge of PPC policies on health and safety, and all other policies.
    - vii. IFM Project Site and equipment safety.
    - viii. Customer satisfaction and customer interaction.
    - ix. Personal hygiene.
    - x. Appropriate dress and rules of conduct while on the IFM Project Site or in the Infrastructure Facility.
    - xi. Fire risks and fire precautions.
    - xii. Respectful workplace / workplace harassment policies.
    - xiii. Familiarization with SFMTA O&M Services.
    - xiv. CAFM user instructions, building automation and Help Desk
    - xv. Confidentiality agreement.
    - xvi. Communication Protocols.
  - (b) PPC orientation shall also include City-specific orientation related to working in and around SFMTA O&M Services, as provided by City for delivery by PPC or to be provided by City at their option.

### **B.8.1.7. Occupational Health & Safety**

- (1) PPC shall have a comprehensive health and safety procedure and ensure it is available to, and used by, all PPC employees.
- (2) PPC shall provide training to all employees and ensure Contractor employees receive training including:
  - (a) Fall arrest training, where applicable.
  - (b) WHMIS training.
  - (c) Safe lifting.
  - (d) Emergency and pandemic preparedness plans.
  - (e) Infrastructure Facility evacuation training.
  - (f) Workplace violence prevention.
  - (g) Personal protective equipment.
  - (h) Respiratory protection program.
  - (i) Health & Safety policy statement.
  - (j) Hazard/Incident reporting.
  - (k) Incident/Accident investigation.
  - (l) Obtaining first aid.
- (3) PPC shall participate as a guest in City's Occupational Health and Safety committee meetings as requested to address Infrastructure Facility-based occupational health and safety issues and address concerns raised by City.
- (4) PPC shall report all recordable injuries and near miss incidents to City in a prescribed format and at a frequency agreed upon with City, at a minimum at the scheduled monthly meetings with City.

## **B.9 Management Interfaces & Communications**

### **B.9.1.1. Communications Protocol**

- (1) PPC shall work with City to:
  - (a) Establish the responsibilities and lines of communication between City and PPC.
  - (b) Coordinate all communications between PPC, PPC's Contractors, City, Other Contractors and other nominated parties as required by the City.

- (c) Provide City with information required by City for communication to internal or external parties such as relevant authorities, the media and the public. PPC shall provide the information in a timely manner but not more than 48 hours after the request.
- (d) Notify City immediately using the agreed communication protocol when PPC becomes aware of issues or failures that may impact SFMTA O&M Services.
- (e) Refer all external requests for information related to the Infrastructure Facility to City.

### **B.9.1.2. IFM Operations Committee**

- (1) Not later than 8 months prior to the Substantial Completion Deadline PPC shall establish a monthly IFM Operations Committee to deal with operational interface and communications at the Infrastructure Facility, both prior to and during the IFM Period including:
  - (a) The transition from the Existing Facilities to the Facility.
  - (b) Any joint review of the IFM Services and the Technical Requirements.
  - (c) Any changes to the IFM Project Plans.
  - (d) Any performance issues.
  - (e) Any interface issues between the IFM Services and SFMTA O&M Services.
  - (f) Any special matter referred to the IFM Operations Committee by City or PPC.
  - (g) Any community and media relations issues.
  - (h) Any other issues pertaining to the IFM Services.
- (2) The IFM Operations Committee does not relieve PPC from communicating on a regular and timely basis directly with City as required.
- (3) PPC shall communicate to the IFM Operations Committee at a minimum regarding the following:
  - (a) Upcoming Maintenance Services.
  - (b) Renewal Work.
  - (c) Changes or anticipated changes in personnel, progress of recruitment.
  - (d) Status of PPC Resources training.
  - (e) Analytics and statistics for the purposes of proactively identifying issues and opportunities.
  - (f) Status on the implementation of tasks identified by the IFM Operations Committee.
  - (g) Status on other tasks and/or action plans.

- (h) Other operational plans or activities.
  - (i) Status of Change Orders.
  - (j) Reports that are required to be delivered to City.
  - (k) Status of rectification activities as a result of an order by authorities having jurisdiction.
- (4) City shall communicate to PPC information related to City specific activities that may impact PPC's day-to-day performance of the IFM Services.
- (5) PPC shall present reports to the City including Performance Monitoring Reports, summarize activity, present any future plans and upcoming changes that may impact the day-to-day operations of the Infrastructure Facility and discuss performance management results, staff complaints and any related corrective plans.
- (6) PPC Responsibilities for the IFM Operations Committee shall include:
- (a) Develop and maintain procedures and schedules for the conduct of the activities of the IFM Operations Committee in mutual agreement with City, as appropriate from time to time;
  - (b) Prepare the agenda and provide at least five Business Days in advance of the meeting; and
  - (c) Prepare minutes and provide them to City not more than five Business Days following the meeting. Minutes shall include issues, discussion summary and action items which will be tracked and reported at each meeting. Unless City notifies Principal Project Company within five Business Days of receipt of the minutes that City disagrees with the contents of the minutes, City and Principal Project Company shall be deemed to have approved such minutes. Principal Project Company shall maintain a complete set of all minutes of the meetings of the IFM Operations Committee and shall make such minutes available for inspection by City during regular business hours.
- (7) The IFM Operations Committee shall not have authority to make decisions with respect to or approve:
- (a) Any amendment to or waiver of any provision of the Agreement;
  - (b) Any change that may materially adversely affect PPC's ability to perform IFM Services or SFMTA's ability to perform SFMTA O&M Services; or
  - (c) Any matter with respect to which City has a right of consent pursuant to the Agreement.
- (8) The Committee shall be composed of:
- (a) Two PPC Representatives
  - (b) One City FM Representative
  - (c) One City Maintenance Representative

(d) One City Authorized Representative

- (9) City shall select the chairperson of the IFM Operations Committee.
- (10) City shall be entitled to replace any of their respective representatives on the IFM Operations Committee by written Notice to Principal Project Company. City will use commercially reasonable efforts to deliver prior written Notice of any such replacement to Principal Project Company. Principal Project Company may replace its representative on the IFM Operations Committee with the prior written consent of City, not to be unreasonably withheld or delayed.
- (11) The Committee shall meet:
  - (a) Monthly unless otherwise mutually agreed by the members of the IFM Operations Committee or the Parties.
  - (b) Ad hoc as required by PPC or City to address specific issues or topics. Special meetings of the IFM Operations Committee may be convened on not less than 5 Business Days' Notice to all members of the IFM Operations Committee identifying the agenda items to be discussed at the special meeting, provided that, in an Emergency, a meeting may be called at any time on such Notice as may be reasonable in the circumstances.
- (12) Unless otherwise agreed by the members of the IFM Operations Committee, the IFM Operations Committee shall meet at the IFM Project Site or another location in San Francisco, California. Meetings of the IFM Operations Committee may be held by means of such telephonic, electronic or other communication facilities as permit all persons participating in the meeting to communicate with each other simultaneously and instantaneously. A person participating in a meeting by such means will be deemed to be present at such meeting, provided that each member of the IFM Operations Committee must attend in person at least once each calendar quarter.
- (13) Members of the IFM Operations Committee may invite, on prior Notice to all members, such advisors and consultants as they require from time to time to attend meetings and provide briefings to the IFM Operations Committee.
- (14) One representative of City and one representative of Principal Project Company shall constitute a quorum at any meeting of the IFM Operations Committee. A quorum of members may exercise all the powers of the IFM Operations Committee. The members shall not transact business at a meeting of the IFM Operations Committee unless a quorum is present.

### **B.9.1.3. Operational Issues Resolution**

- (1) PPC shall develop and implement an operational issues resolution process that is acceptable to City and consistent with the Agreement. The process shall define resolution timelines and enable escalation of issues to more senior levels, including, as necessary, following Article 18 (Contract Dispute Procedures).

#### **B.9.1.4. City Orientation & Training**

- (1) PPC shall develop and implement, in collaboration with City, a service orientation program for relevant City Personnel which they will conduct initially prior to the Substantial Completion Deadline and then when City changes City Personnel, or from time to time acting in accordance with Good Industry Practice, at the Infrastructure Facility. The service orientation program shall be in accordance with City requirements.
- (2) PPC shall develop and distribute, at City's discretion, a summary of the IFM Services.
- (3) PPC shall ensure that City Representative has updated, correct and timely information about the CAFM, security system and any other PPC provided system which City operates or interfaces with.
- (4) PPC shall provide training to the required City Personnel initially as directed by the City Representative on equipment and systems for related to the SFMTA O&M Services.
- (5) The Help Desk Services shall also include formal communications (electronic information or paper flyer, at City discretion) and ad-hoc training as may be required to ensure City staff are aware of the Help Desk Services.
- (6) PPC shall develop and implement, in collaboration with City, an electronic training program for City staff that operate, use, or interface with any of the Maintained Elements. City shall implement a "train the trainer" program; however, PPC shall be required to conduct training program or refresher every 2 years for the trainer and any other staff required by City. In addition, if the equipment, procedures or software related to the Maintained Elements changes, PPC shall provide revised training related to the changes.

### **B.10 Periodic Reporting**

- (1) PPC shall provide periodic reporting as outlined further below. Periodic reporting shall include all reporting requirements outlined in this IFM Specification.
- (2) All reports shall be made available in print and searchable electronic format. Data related to reporting shall be made available for download or export in original electronic format that permits analysis and drill-down as applicable.
- (3) The Monthly Reporting further below outlines specific requirements but does not relieve PPC from periodic reporting responsibilities outlines elsewhere in these IFM Specifications or in the Technical Requirements as it relates to the IFM Services. Reports are expected to provide City with sufficient information to verify PPC's performance of their responsibilities however should also provide useful information for PPC to manage their service performance.

## **B.11 Monthly Reporting**

- (1) PPC shall deliver the monthly reports set out in this Section B.11 to City five Business Days following the last day of the month. In all cases, reported information should include comparisons to previous months and previous year where available, provide information in graphic formats and be accompanied by analysis and plans for improvement or change where relevant.
- (2) City will review the report within 10 Business Days following receipt of the report and notify PPC of any errors or omissions or changes it deems required.

### **B.11.1. Performance Monitoring Report**

- (1) PPC shall prepare a monthly report of the Performance Monitoring Program (the “Performance Monitoring Report”), comprised of a summary of all Service Failures and Availability Failures and the related performance details and applicable financial adjustment to the invoice in accordance with Exhibit 4 (Payment Schedule)
- (2) For each Contract Quarter, the Performance Monitoring Report shall present quarterly information to support the invoicing and payment of Quarterly Availability Payments in accordance with Exhibit 4 (Payment Mechanism). This Quarterly Performance Monitoring Report shall be a roll-up of the preceding months’ information as outlined above in Section B.11.1(1).

### **B.11.2. Operational Report**

- (1) PPC shall prepare a monthly operational report with the following:
  - (a) An executive summary.
  - (b) A summary of major activities and issues during the past month for each IFM Service category as well as general responsibilities such as quality, risk management, OH&S, Contractor procurement and management, etc.
  - (c) A summary of all demand requests with statistics, graphs and analysis of trends and action to be taken based on the results.
  - (d) Human resources reporting including training, orientation, certificates, personnel and organizational changes, etc.
  - (e) Statutory compliance.

### **B.11.3. Maintenance Status Report**

- (1) PPC shall provide a monthly report detailing the following:
  - (a) Past month’s performance on Demand Maintenance
  - (b) Past month’s performance on Scheduled Maintenance

(c) Monthly Scheduled Maintenance activities for the upcoming month.

#### **B.11.4. Renewal Work Report**

- (1) PPC shall provide a monthly report detailing the following:
  - (a) Completed Renewal Work projects year-to-date.
  - (b) Renewal Work activities for the upcoming month.

### **B.12 Annual Reports**

- (1) City will review the report within 20 Business Days following receipt of the report and notify PPC of any errors or omissions or changes it deems required. In all cases, reported information should include comparisons to previous Contract Year, provide information in graphic formats and be accompanied by analysis and plans for improvement or change where relevant.

#### **B.12.1. Annual IFM Services Report**

- (1) The Annual Summary report shall be provided by PPC to City no more than 20 Business Days following the completion of each Contract Year. This report shall be in a similar format to the Monthly Reporting however with an annual summary of results and information.

### **B.13 Annual Scheduled Maintenance & Renewal Work schedule**

- (1) PPC shall provide the annual Scheduled Maintenance schedule one month prior to the end of each Contract Year outlining major maintenance activities planned for the next Contract Year that may impact SFMTA O&M Services.
- (2) PPC shall provide a planned Renewal Work schedule to the City each Contract Year on a date to be agreed with the City. This schedule shall include the proposed start and completion dates of each project.

### **B.14 Risk Management**

- (1) PPC shall review their services and identify areas of risk and put risk management plans in place to mitigate the risks.
- (2) Where PPC identifies any risk or issue that may affect SFMTA O&M Services, whether within the service responsibility of PPC or not, PPC will report the risk to City.

## **B.15 Document Management**

- (1) Without limiting Article 21 of the Agreement, PPC shall manage all documentation related to the Infrastructure Facility and ensuring documents are well organized, stored, secured, backed-up, maintained and eventually handed over to City.
- (2) All information is to be made available to City in non-proprietary format. Where the operational processes use a proprietary format, such as facility management software, PPC shall ensure that information can be extracted and provided in a non-proprietary format that meets the requirements of City.
- (3) PPC shall ensure that all relevant literature from suppliers and manufacturers required in the normal course of providing the IFM Services is obtained, updated and stored appropriately.
- (4) PPC shall manage and maintain at the Infrastructure Facility up-to-date copies of all applicable literature, records, permits, licenses and approvals and other documentation related to IFM Services.
- (5) Prior to providing any information required under Applicable Law and Standards to the appropriate Governmental Entity(ies), PPC shall provide a copy to City in advance for review and approval. This requirement shall not mitigate PPC's responsibilities under Applicable Law and Standards to deliver information to the appropriate Governmental Entity(ies) within the required timelines.

## **B.16 Quality & Performance Management Services**

### **B.16.1. General Requirements**

- (1) PPC shall develop, maintain and implement a system for managing quality for all services recording and acting on occupant feedback and satisfaction with respect to the IFM Services.

### **B.16.2. IFM Quality Management Plan**

- (1) PPC shall implement an IFM Quality Management Plan to manage and measure the quality of IFM Services.
- (2) The Quality Management Plan shall include the following, in accordance with accepted quality management processes and systems and Good Industry Practice:
  - (a) A commitment to quality.
  - (b) An overview to describe the PPC's approach to maintaining and managing the quality system.
  - (c) The roles and responsibilities of individuals and management related to managing quality.
  - (d) Records management requirements for the quality management system, including managing procedures and policies.

- (e) Quality processes, including measuring, testing, reporting and acting on quality and performance management results.
- (f) Inspection and auditing process to test quality and adherence to established procedures.
- (3) PPC shall conduct quality audits of each service in accordance with its Quality Management Plan at least annually. The IFM Provider shall report on the results of the quality audits in the month following the audits.

## **B.17 Occupant Satisfaction Surveys**

- (1) PPC shall propose the questions and methodology for City approval and agreement of the occupant satisfaction surveys at least two months in advance of the survey being conducted. PPC shall adjust their survey based on City's comments. The occupant satisfaction survey questions are to remain the same in future years unless approved by City.

### **B.17.1. Occupant Satisfaction Surveys:**

- (1) PPC shall conduct occupant satisfaction surveys of City employees annually commencing within the first 6 months after Substantial Completion Deadline and cover each of the relevant IFM Services for which City employees would be able to provide an opinion.
- (2) Subsequent survey shall be conducted annually unless otherwise directed by City to conduct the survey at a frequency less than annually.
- (3) The occupant satisfaction survey shall be distributed to all City employees at the Infrastructure Facility using a web-based survey methodology, supplemented with paper surveys where necessary. The methodology shall be discussed with and agreed by City.

### **B.17.2. Transaction Satisfaction Surveys:**

- (1) PPC shall conduct Transaction Surveys within 3 months after Substantial Completion Deadline. Transaction surveys may be ongoing or conducted at a minimum quarterly during the IFM Period and cover at least 15% of all transactions (Help Desk calls or web requests) quarterly.

### **B.17.3. Baseline Survey Results**

- (1) The first survey results shall become the baseline survey for performance management purposes.
- (2) Every 5 Contract Years, the baseline for each separate service category is reset to the average of the previous 5 Contract Years.

## **B.17.4. Satisfaction Survey Report**

- (1) PPC shall:
  - (a) Provide survey results and analysis to City within one Month of the close of the survey for the occupant satisfaction survey or within one Month after each Quarter for the Transaction Survey.
  - (b) Provide an action plan to City within 45 days of the close of the survey for any of the following conditions:
    - i. Overall average below that of the previous survey.
    - ii. Specific services/questions below the results from the previous survey
    - iii. Specific services/questions below the overall average of the current survey.
    - iv. Conditions identified as being of specific concern to City.
  - (c) Review and agree with City on the action plan steps and activities to be implemented along with timelines to improve satisfaction results.

## **B.17.5. City Surveys**

- (1) City may choose to administer surveys of its own or in participation with other organizations. The surveys may include questions related to the IFM Services.
- (2) City may request that PPC prepare Performance Action Plan(s) where applicable.
- (3) PPC will provide the action plan within fifteen (15) Business Days of receiving the request from City. The action plan will summarize the results, identify areas for improvement and indicate strategies to be used to improve results, including the timeframe for implementation.

## **B.17.6. City Inspection and Audit**

- (1) PPC shall, within twenty-four (24) hours' Notice from City:
  - (a) permit City to access, review, inspect and audit the Infrastructure Facility and PPC's service delivery related records, information, reports and other Books and Records maintained by PPC to confirm that:
    - i. the Performance Monitoring Program adequately stores information and has the capacity to generate reports readily available for audit.
    - ii. the Infrastructure Facility is being maintained in accordance with the terms of the Agreement.
    - iii. PPC is otherwise meeting its obligations under the Agreement related to the IFM Services.

- (2) PPC shall assist City with any audit or inspection of the Infrastructure Facility, the IFM Services, or the Performance Monitoring Program.

## B.18 Performance Monitoring Program

- (1) PPC shall monitor performance of IFM Services including Availability Failures and Service Failures and provide a Performance Monitoring Report for results in the month within five business days of the end of each month.
- (2) The Performance Monitoring Report shall document all results and related Availability Failures or Service Failures along with the related Deductions in accordance with Exhibit 4 (Payment Mechanism.)
- (3) The Performance Monitoring Report shall also include a space trending report showing space temperatures during the period and identifying any rooms which have missed the required Performance Requirements.

### B.18.1.1. Priority Descriptions

- (1) The following describe the basis for establishing the priority for application to the Response Times and Rectification Times.
  - (a) **Priority 1** – Situations requiring immediate action to return the Infrastructure Facility to normal operations, stop accelerated deterioration, or correct a safety hazard that imminently threatens life or serious injury to public and/or City employees.
  - (b) **Priority 2** – Situations that will imminently become critical, if not corrected expeditiously, includes intermittent interruptions and/or potential safety hazards.
  - (c) **Priority 3** – Conditions requiring appropriate attention to preclude deterioration or potential downtime and associated damage or higher costs if deferred further. Items representing a practical improvement to existing conditions. These items are not required for the most basic functions of the Infrastructure Facility but will improve the overall usability and accessibility and/or reduce long-term maintenance.

### B.18.1.2. Response and Rectification Times

Category	Response Time	Rectification Time
Priority 1	15 minutes	4 hours (for all Functional Component Rank categories)
Priority 2	The longer of 30 minutes or prior to the resumption of core work hours	The longer of 8 hours or prior to the resumption of core work hours (for all

Category	Response Time	Rectification Time
		Functional Component Rank categories)
Priority 3	The longer of 2 hours or prior to the resumption of core work hours	7 calendar days

### B.18.1.3. Availability Failure Response and Rectification Times

Functional Component Rank Category	Response Time	Rectification Time
5	15 minutes	4 hours
4	15 minutes	8 hours
3	The longer of 30 minutes or prior to the resumption of core work hours	12 hours
2	The longer of 30 minutes or prior to the resumption of core work hours	24 hours
1	The longer of 60 minutes or prior to the resumption of core work hours	48 hours

### B.18.2. Performance Action Plans

- (1) Where the City (directly or through the PPC) observes a significant or consistent non-performance on any IFM Services, the PPC shall prepare a Performance Action Plan (“PAP”), upon request by the City. The PAP will be due either five Business Days from the request or an alternate later date as identified by City.
- (2) The PAP submitted to City will, at a minimum, contain a summary of the issues raised by City, an analysis of the root causes of the issues, the steps that will be undertaken by PPC to address the issues and specific timeframes for such steps.

## **B.19 Help Desk Services**

### **B.19.1. General Requirements**

- (1) PPC shall ensure the Help Desk acts as a method to receive, track and dispatch Service Requests as well as managing various communications, tracking work activity, reporting and analysis of Service Requests.
- (2) PPC shall work with City when developing Help Desk procedures to develop a listing of typical Priority 1, Priority 2 and Priority 3 issues and use this as a training tool with the Help Desk agents and City staff as appropriate to ensure accurate and timely categorization of Service Requests.

### **B.19.2. Hours and response requirements**

PPC shall ensure:

- (1) The Help Desk shall be available and receive phone calls 24 hours a day, 365(6) days a year. In addition, web access to the Help Desk for users to enter web Service Requests shall be available 24 hours a day, 365(6) days a year.
- (2) The Help Desk agent shall respond to all enquiries and Service Requests, track all calls with information as required further below, prioritize the calls in accordance with these Technical Requirements and dispatch to a qualified resource to address the Service Request.
- (3) All calls to the Help Desk shall be answered by an agent within 30 seconds. Web Service Requests are to be acknowledged via email to the requestor within 15 minutes.
- (4) There is a backup Help Desk available in the event that the main Help Desk becomes unavailable.
- (5) It communicates the Help Desk contact number and web address to City employees and re-communicate as needed periodically to ensure occupants and City employees are reasonably informed.
- (6) The Help Desk allows Failure Events to be reported by the City to the Help Desk as soon as possible after City becomes aware of the Failure Event.
- (7) All service requirements and Failure Events identified at any time by PPC or its Contractors shall be promptly reported to the Help Desk.

City shall make reasonable efforts to route issues identified by employees through their supervisors or administrative resources who will then call or enter a web request on their behalf for non-emergency Service Request calls to moderate and consolidate the number of calls for Priority 2 or Priority 3 Service Requests.

### **B.19.3. Information Requirements**

- (1) PPC shall use a system to receive, track, record, take action and report on Service Requests of all types.
- (2) Help Desk data and reports shall be made available to City on-line with read-only access to the software used by PPC.
- (3) PPC shall ensure the Help Desk provides emergency incident support by raising alarms, reporting events to internal and external authorities and logging details of emergencies.
- (4) The Help Desk shall ensure the information of all Service Requests and calls are tracked. This includes the following:
  - (a) Help Desk operator's name or other identifier;
  - (b) Requester's name;
  - (c) Date and time of request;
  - (d) Affected location as relevant;
  - (e) Repair or correction required;
  - (f) Service Failure, and/or Availability Failure;
  - (g) Event Category (Priority 1, Priority 2 or Priority 3);
  - (h) Unique request reference identifier;
  - (i) Employee or Contractor and contact info to which the request was dispatched;
  - (j) Date and time request was dispatched;
  - (k) Action taken and by whom;
  - (l) Response Time and Rectification Times; and
  - (m) Duration of Availability Failure.
- (5) PPC shall not delete or alter any details recorded by the Help Desk unless approved in writing in advance by City and the following information is recorded:
  - (a) The exact nature and impact of the alteration or deletion;
  - (b) The reason for the alteration or deletion; and
  - (c) The name of the person who authorized the alteration or deletion.

## **B.19.4. Redirection**

- (1) When calls or web Service Requests are received by PPC for activities that are not within PPC's scope or responsibility, PPC shall redirect the calls or Service Requests based on the redirection guidance provided by City. This may be to provide an alternate number or web link for the requestor to contact or, if possible, transfer them to another extension if the request is by phone.
- (2) PPC shall log these Service Requests along with customer information and who they were redirected to and the date/time within their CAFM system for verification of the redirection and for reporting of redirections to City as part of Help Desk reporting.

## **B.19.5. Reporting**

- (1) PPC shall report all Help Desk activities and performance within the required reports outlined by this specification. This will include analysis and action plans based on the results.

# **B.20 Computer Aided Facility Management System (CAFM)**

## **B.20.1. Infrastructure Facility Management**

- (1) The PPC shall utilize a CAFM as the basis for development of the Asset Management Plan and specifically to manage the Infrastructure Facility. The CAFM shall be developed in coordination with the Project's BIM. City will have access to the Infrastructure Facility's CAFM for auditing purposes and submission of task orders into the system.
- (2) The CAFM system, including hardware and software, shall allow for the following Infrastructure Facility management functions:
  - (a) Long-range and annual Infrastructure Facility planning.
  - (b) Infrastructure Facility financial forecasting.
  - (c) Work specifications, installation, and space management.
  - (d) Architectural and engineering planning and design, with floor plans, area and room numbers, doors, keys and key card access system.
  - (e) New construction and/or renovation.
  - (f) Maintenance and operations management, including both Scheduled Maintenance, Demand Maintenance and Renewal Work.
  - (g) IFM Services order execution and organization.
  - (h) Materials purchasing.

- (i) Spare parts inventory management.
- (j) Telecommunications integration, security, and general administrative services.
- (k) Sustainability monitoring, reporting, and forecasting.
- (l) Subcontracts, suppliers, and personnel management.
- (m) Customer satisfaction auditing.
- (n) Document management.
- (o) Interface with BAS (described below).

## **B.20.2. CAFM Interface with Hexagon EAMS**

- (1) PPC shall work with City to enable City to implement an integration within their system between the PPC system and City's existing EAMS system.
- (2) The intent is to achieve the following:
  - (a) Reduce the necessity for City staff to use two systems.
  - (b) Enable the creation of a Service Request in City's system that will automatically populate the PPC system and be managed by PPC as if it was entered through PPC's Help Desk or from within the PPC system.
  - (c) Ability for City to check status/updates to PPC's system's work order from within the City system as well as the ability to generate reports.

## **B.21 Utilities Management Services**

### **B.21.1. General Requirements**

- (1) PPC shall manage Utilities to meet the requirements of SFMTA O&M Services in consultation with City, including managing utilities in an efficient, economical manner with due regard for initial design, LEED designations and environmental responsibility, in accordance with Exhibit 12 (Energy Management).
- (2) PPC shall ensure connections to Utility Owner are maintained 24 hours per day, 365(6) days per year to appropriate Technical Requirements and adequate capacity to meet the requirements of City, including provisions for backup in accordance with the design requirements.

## **B.21.2. Management**

- (1) PPC Shall monitor, plan and inform City of all scheduled interruptions that may impact SFMTA O&M Services immediately upon notice related to the Utility Owner, and managing the impact of the interruptions to minimize the disruption.
- (2) PPC shall interface with the Utilities providers as needed, including receiving and posting/administering all notices related to utility services.

## **B.21.3. Energy Conservation**

- (1) PPC shall developing and implementing, with City input, an awareness and communication plan to promote conservation initiatives.

## **B.21.4. Analysis and Reporting**

- (1) PPC shall:
  - (a) Monitor all consumption and provide reporting in compliance with Exhibit 12 (Energy Management)
  - (b) Maintain a database of all consumption related information, including historical data from Substantial Completion. The database must be made available to City on request in a non-proprietary format, downloadable into Microsoft Excel or similar spreadsheet software as designated by City.
  - (c) Advise City on consumption and cost implications for SFMTA O&M Services requirements, process changes, modernization, equipment changes or renovations.
  - (d) Prepare, maintain and provide all information, including historical and statistical records, consumption data, meter readings and related building operations data as may be reasonably required by City for their own purposes or by Authorities related to legislative requirements.

## **B.22 Environmental Management Services**

### **B.22.1. General Requirements**

- (1) All IFM Services shall be performed in accordance with PPC's Environmental Management System to minimize environmental impact and minimize impacts on the health of Building Occupants.
- (2) PPC shall provide an annual environmental compliance statement in a form acceptable to City.

## **B.22.2. Environmental Management System**

- (1) PPC shall have in place and follow an Environmental Management System that includes relevant policies and processes to address the following areas:
  - (a) Energy conservation.
  - (b) Water conservation.
  - (c) Greenhouse gasses emission reduction.
  - (d) Green materials use.
  - (e) Halocarbons management.
  - (f) Storage tank management (fuel, lubrications, chemicals, etc.).
  - (g) Potable water quality management.
  - (h) Indoor air quality management.
  - (i) Material storage and use.
  - (j) City employee communications.
  - (k) Training.
  - (l) Testing, inspection and auditing.

## **B.22.3. Environmental Conditions**

- (1) PPC shall deliver services using environmentally responsible processes, materials, equipment and supplies to minimize effects on the environment.
- (2) PPC shall develop and implement a procurement policy that encourages environmentally friendly product and material selection and use and service delivery from subcontracted services.
- (3) PPC shall conduct a minimum of annually IAQ testing as well as IAQ tests where IAQ complaints are made or persistent IAQ issues are observed in order to identify and rectify the source of the complaint.

## **B.22.4. LEED**

- (1) PPC shall manage services to maintain the standards initially required to meet the LEED certification requirements, including when implementing maintenance, renewal projects and operational practices.

- (2) PPC shall obtain LEED EBOM certification, commensurate with the LEED NC certification obtained after the construction period, within five years of Substantial Completion of the Infrastructure Facility and maintain the certification throughout the IFM Period.

## **B.23 Emergency Management Services**

### **B.23.1. General Requirements**

- (1) PPC shall be responsible for Infrastructure Facility operations and related contingency response during an emergency. This includes all resources necessary as they relate to IFM Services, in coordination with City as required during an emergency.
- (2) In collaboration with City, PPC shall develop Emergency management and contingency plans and protocols, including decision making, for the IFM Project Site related to PPC's responsibilities that tie in with City's own emergency management plans and meet City's emergency management requirements.
- (3) PPC shall provide to City an up-to-date contact list of employees and Contractor employees, including afterhours contact information. City shall provide PPC with an up-to-date contact list of City contacts, including afterhours contact information.
- (4) PPC shall conduct an operational risk assessment within 3 months before and then revised no later than 3 months after Substantial Completion Deadline to identify risks that have the potential to impact SFMTA O&M Services. This assessment will result in a report to City, identifying risk, impact, likelihood and mitigation. Specific areas of risk may require a management plan by City. The assessment will be updated as required if there are material changes that impact the operational risk profile.
- (5) PPC shall develop an Earthquake Inspection Plan to minimize delay in re-occupying the Infrastructure Facility follow in significant seismic event as part of the City of San Francisco's Building Occupancy Resumption Program (BORP), developed and maintained by the City of San Francisco.

### **B.23.2. Emergency Response**

- (1) PPC shall respond and address emergency requirements at the IFM Project Site with sufficient resources as necessary.
- (2) PPC shall have in place specific response and mitigation plans for all possible emergency situations that may impact IFM Services or impact SFMTA O&M Services. This includes:
  - (a) Utility disruptions.
  - (b) Natural disasters.
  - (c) Flood/Water leaks.
  - (d) Heating/Cooling failure.

- (e) Weather Events.
  - (f) Bomb threats.
  - (g) Fire (including evacuation plan).
  - (h) Environmental spill / Hazardous Material release.
  - (i) Medical emergency.
  - (j) Structural collapse.
  - (k) Pandemics.
- (3) PPC shall provide an emergency action report following an Emergency that outlines the emergency, action taken and recommended mitigation to prevent future occurrences.
  - (4) PPC shall provide all necessary assistance to facilitate activities associated with post- event reoccupation including inspections (as part of the City of San Francisco’s Building Occupancy Resumption Program (BORP), developed and maintained by the City of San Francisco).

### **B.23.3. Contingency Planning**

#### **B.23.3.1. IFM Project Site Based**

- (1) PPC shall have in place contingency plans for common failures or external events that impact the delivery of IFM Services (including such events that have a corresponding impact on the SFMTA O&M Services). This includes events such as power failure, leaks, chiller failure, water supply failure, lighting failure, natural disasters, pandemics, heating failure, etc.
- (2) PPC shall work with City to integrate their contingency planning with City’s contingency plans to ensure they align with City requirements.

#### **B.23.3.2. PPC Business / Services**

- (1) PPC shall have in place contingency plans for IFM Services including for related services and processes that have the possibility of impacting the Infrastructure Facility.

### **B.24 Fire Management & Evacuation**

- (1) PPC shall develop fire management and evacuation plans for the Infrastructure Facility and the IFM Project Site in conjunction with City.
- (2) PPC shall submit the fire safety and evacuation plan to the local fire authorities in accordance with legislative requirements prior to Substantial Completion Deadline. PPC will keep the plan up-to-date and make changes as needed to accommodate SFMTA O&M Services.

- (3) PPC shall organize, plan and implement fire drills with the involvement and cooperation from City. Timing of training and fire drills is to be agreed by City.
- (4) PPC shall provide training for City and fire warden representatives.

## **B.25 Move-In Services**

### **B.25.1. General Requirements**

- (1) PPC shall provide resources to plan, coordinate, manage and execute the physical move-in into the Infrastructure Facility and represent PPC on the Move-In Committee no later than eight months prior to Substantial Completion Deadline.
- (2) The Move-In Resource shall manage PPC's Move-In and integrate with City and other parties for all activities of PPC's Move-In. The Move-In Advisor will also interface with City and related Move-In Subcommittee for the Move-In of SFMTA O&M Services from the current location to the Infrastructure Facility.
- (3) PPC shall develop and submit a Move-In Plan related to their services to City no later than six months prior to Substantial Completion Deadline. PPC shall develop the plan with the input and involvement of City and take into account the SFMTA O&M Services.
- (4) The Move-In Plan shall include:
  - (a) Implementation plan for the IFM Services.
  - (b) A timetable for completion of all activities required for Move-In in traditional project schedule format.
  - (c) Information and input required from City.
  - (d) Communication plans for City employees, Contractors, etc.
  - (e) Timelines for all documents and plans required by these IFM Specifications.
  - (f) Development of processes and procedures in conjunction with City, including change management interaction with City.
  - (g) Information requirements and transfer.
  - (h) Progress meeting schedule.
  - (i) Status and reporting mechanism.
  - (j) Resourcing requirements, including Move-In staff, hiring and procurement of Contractors.
  - (k) Training and orientation of PPC, Contractors and relevant City staff.

- (5) The IFM Resource and key operational staff shall be hired and at the Infrastructure Facility during the Move-In period sufficiently in advance to enable a smooth Move-In and ensure training and orientation on facility systems, SFMTA O&M Services and participate in commissioning activities. At a minimum before Substantial Completion Deadline:
- (a) IFM Manager no less than six months in advance.
  - (b) Move-in Resource no less than eight months in advance.
  - (c) Operational and technical staff no less than two months in advance.
  - (d) Admin/support staff no less than two weeks in advance.

## **Section C - IFM Project Site & Infrastructure Facility Operations**

### **C.1 Security Services**

#### **C.1.1. City Security Services**

- (1) City is responsible for physical security related to the Infrastructure Facility, including exterior security.
- (2) City is responsible for monitoring the following [at the Infrastructure Facility] and initiating action, as required, including notifying PPC as necessary for the following:
  - (a) Intrusion alarms.
  - (b) Access control system.
  - (c) Fire alarms and initiating automated announcements as required. PPC is responsible for monitoring the fire panel alarms and trouble alerts.
  - (d) CCTV.
  - (e) Elevator emergency phone and any related elevator emergency alarms.
- (3) City is responsible, as a user of the security access system, for providing and issuing access cards to City and PPC personnel. PPC shall submit requests to the City for access for their personnel.
- (4) City is responsible for providing and issuing keys to City and PPC personnel for Maintenance and Transit Spaces and Office / Admin and Training Spaces. PPC shall submit requests to the City for access for their personnel.

#### **C.1.2. PPC Security Services**

- (1) PPC is responsible for:
  - (a) Providing access and training to the City on the CCTV, intrusion alarm and access control system for coordination and enabling the City to monitor their responsibilities.
  - (b) Securing any doors or windows which may present a security risk and advising the City of this breach of Security.
  - (c) Receiving notification from the City of any incident brought to City's attention and take action to investigate, report and mitigate.

- (d) Communicating with and identify security issues or suspicious activity, including potential criminal activity (including graffiti and other forms of Vandalism), as required based on the nature of the issue and in accordance with established procedures, immediately upon discovery and taking independent action and/or direction as necessary regarding these security issues.
- (e) Providing and issuing keys to City and PPC personnel for PPC Spaces.

### **C.1.3. Security Systems Training**

- (1) PPC shall ensure City Personnel are trained on the safe and effective operation of all security and surveillance systems installed at the Infrastructure Facility and changes to these systems by:
  - (a) Conducting initial training of City's personnel both SMFTA employed or contracted on the safe and effective operation of security and surveillance systems and equipment (including making changes to CCTV camera settings and alarm parameter settings) and ensuring that City is capable of training new City Personnel on security and surveillance systems (including the provision of training resources accepted to City).
  - (b) Coordinating with City and conducting the initial training to City Personnel on new, revised or replacement of security and surveillance systems, equipment, or software as they come online.
  - (c) Initiating additional training / retraining to City Personnel for security and surveillance systems and equipment on an annual basis.

### **C.1.4. Surveillance and Alarm Systems:**

- (1) PPC shall Respond to and act on alarm conditions in accordance with emergency management plans established in conjunction with City.
- (2) PPC shall reset the fire alarm and any systems that are connected to the fire alarm when cleared by the Fire Department.
- (3) PPC shall maintain and update all firmware and software of the active equipment on a regular basis or as required by the system manufacturers to keep current. PPC shall ensure that the software, hardware and physical elements, including security features, access doors and related security devices and systems (including cameras and alarms) are functional and do not encourage or enable security risks or intrusions to the Infrastructure Facility. Records of software versions shall be kept up to date and available for verification at all times.

### **C.1.5. Incident Reporting, Emergency Assistance and Crime Prevention**

- (1) PPC shall:
  - (a) Summon the police where a crime is committed, where a crime is suspected of being committed or in any other situation where Police Service assistance is required.

- (b) Respond to any alarm activated by any security system or any request for assistance by any user anywhere in the Infrastructure Facility or on the IFM Project Site immediately. In any case attend at the Infrastructure Facility of the alarm or request, as appropriate.
- (c) Develop and implement a risk assessment plan to deal with all security matters which may occur at the Infrastructure Facility in consultation with City, including, terrorism, Vandalism, and serious assault (including sexual assault) on any Building Occupants or their property. This plan is to be reviewed at least annually with City and any relevant authorities.

### **C.1.6. Access Control**

- (1) PPC shall ensure that access keys/key cards issued to any PPC-Related Entity by the City are tracked and managed to maintain security and not lost or misplaced and are not used by unauthorized persons.
- (2) If any PPC-Related Entity misplaces keys which then requires re-keying to maintain a secure facility, PPC will pay for the cost of any re-keying services.

## **C.2 Solid Waste Collection, Recycling, & Removal Services**

### **C.2.1. General Requirements**

- (1) City shall:
  - (a) collect, store and remove from the IFM Project Site all City generated waste.
  - (b) confidentially shred, remove and dispose of shredded materials related to their own operations from the Infrastructure Facility.
  - (c) collect, store and dispose of waste arising from SFMTA O&M Services, including that from the Office/Admin and Training Spaces.

#### **C.2.1.1. Bus & Maintenance Waste**

- (1) City shall collect, store and dispose of waste, arising from SFMTA O&M Services. City shall also dispose of waste collected by PPC under Section 2.1.1(2)(b).
- (2) PPC's shall:
  - (a) Collect and store from the IFM Project Site all waste generated by PPC in the performance of IFM Services.
  - (b) Transfer collected waste into City bins within the centralized waste storage areas.

- (c) At all times, keep the Infrastructure Facility free from accumulations of waste materials, recyclable materials or rubbish.
- (d) Collect, store and dispose of all excessive construction waste generated by PPC in performance of IFM Services.

### **C.2.1.2. Hazardous Waste**

- (1) City shall collect, store, and dispose of Hazardous Waste generated by SFMTA O&M Services with the appropriate health and safety measures at all times.
- (2) PPC shall be responsible for Hazardous Waste used by PPC in the performance of IFM Services as well as typical Hazardous Waste generated from PPC office activities and from PPC equipment.
- (3) PPC's Hazardous Waste shall be properly stored, secured and disposed of through approved, certified waste handlers.
- (4) PPC shall provide a list of hazardous waste materials and typical volumes stored on the IFM Project Site to City annually, with updates whenever the list of waste materials changes.
- (5) PPC shall track the collection and disposal of hazardous waste materials and provide the paper trail demonstrating proper handling and disposal to City on request.

## **C.3 Pest Control Services**

### **C.3.1. General Requirements**

- (1) PPC shall develop and implement a pest control procedure to provide routine preventive and reactive (on-call) pest control services in an integrated manner. In particular, implement aggressive application of best practices for humane and effective abatement and deterrence measures for pigeons and other birds.
- (2) PPC shall provide a quarterly chemical usage report detailing actual chemicals, volumes, and/or equipment containing chemicals and devices used including providing all safety data sheets as well as providing a monthly inspection report as part of the regular monthly meetings.
- (3) PPC shall provide a quarterly bird and pest control report detailing bird and pest abatement and deterrence measures and the ongoing maintenance of the relevant measures installed in the Infrastructure Facility
- (4) Pest Control services shall be designed to minimize environmental impact, be humane and maximize effectiveness, including both preventive and reactive control methods for all types of pests, including insects, rodents, birds or larger animals.

- (5) Where chemical treatments are applied, they shall be strictly controlled and monitored. PPC shall advise City in advance of their application, provide the safety data sheet and it's specific usage and application. Where requested, PPC will prepare a communication / notice for City employees prior to application. City reserves the right to approve or deny use of any chemical treatments.

## **C.4 Maintenance Services**

### **C.4.1. General Requirements**

- (1) PPC shall properly maintain the Infrastructure Facility and the IFM Project Site to ensure that they:
  - (a) Meet these IFM Specifications and Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (2) PPC shall maintain the IFM Project Site to ensure that:
  - (a) Concrete, asphalt or other hard surface materials have no uneven surfaces resulting in tripping hazards, spalling, holes, damaged or broken curbs and are free of potholes, open cracks, and sinking;
  - (b) Curbs and edgings are sound, with no chips, cracks, breaks;
  - (c) All areas drain as set out in these IFM Specifications and otherwise as required by the Technical Requirements;
  - (d) The drainage system, including all gutters and drains, are kept clean and unblocked and function in accordance with these IFM Specifications and otherwise as required by the Technical Requirements;
  - (e) All roadway, lane and parking lot lines are clear and complete;
  - (f) All roadway, lane, parking and pedestrian areas are swept and/or power washed annually at a minimum to remove accumulated materials and clean the surfaces.
  - (g) Barrier-free access is maintained, where applicable;
  - (h) Exterior signs including informational, directional and parking signs are legible, free from rust, corrosion, peeling or fading, with all posts maintained plumb;
  - (i) Exterior structures including flagpoles, fencing, railings, bicycle racks and exterior wall signage are safe, sound, secure, operational and free from rust, corrosion, peeling or fading;
  - (j) Flagpoles are maintained plumb;

- (k) Fencing and gates are sound, free from rust, corrosion or peeling, not sagging and gates function as required; and
- (l) Permanently fastened fixtures are maintained in a safe condition, securely fastened and free from rust, corrosion or peeling.

## **C.4.2. Landscaped Areas**

- (1) The landscaped areas include all grass, trees, shrubs and other decorative plants at the Infrastructure Facility.

## **C.4.3. Maintenance Requirements:**

- (1) PPC shall properly maintain the landscaped areas to ensure that the landscaped areas:
  - (a) Meet these Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (2) PPC shall maintain the landscaped areas to ensure that:
  - (a) The landscaped areas free from visible weeds and are in a healthy growing condition, with edges neatly trimmed;
  - (b) Trees and shrubs are regularly pruned and fertilized, with dead growth removed;
  - (c) Dead or diseased trees or shrubs are promptly removed and replaced, as required;
  - (d) Tree and shrub growth does not interfere with walkways and does not cause a safety hazard or become unsightly;
  - (e) Mulch or other ground cover is in place with uniform and complete coverage;
  - (f) All landscaped areas drain as required in these IFM Specifications and otherwise as required by the Technical Requirements;
  - (g) Edging is completed once per month or more frequently as needed to meet the obligations in (a).
  - (h) Grass height is maintained between 2.5 and 3.0 inches;
  - (i) Fertilizer is applied as required to maintain healthy growth;
  - (j) Cleaning following the winter season to remove accumulated leaves, trash and other debris from landscaped areas and hard surface areas; and
  - (k) Aerating is done annually.

- (3) PPC shall monitor the landscaped areas in accordance with PPC's Maintenance Plan. All replacement shrubs, trees or decorative plants shall meet these Technical Requirements and relevant Regulatory Approvals.

## **C.5 Cleaning Services**

### **C.5.1. City Provided Cleaning**

- (1) Except as set out in Section C.5.2, below City provides cleaning services for SFMTA O&M Facilities.

### **C.5.2. PPC Provided Cleaning**

- (1) PPC shall provide cleaning services as provided in this Section C.5.2 for the PPC Spaces as defined in Appendix D and will include :
  - (a) All specialty interior areas of the building that are designated for the PPC's use in providing the IFM Services.
  - (b) Electrical and mechanical rooms.
  - (c) Service spaces.
  - (d) Utility closets (except for custodian closets, which are the responsibility of City.
  - (e) PPC spaces including designated offices and toilets  
(together the "Cleaning Services").
- (2) PPC shall provide all interior and exterior window cleaning for the Infrastructure Facility as follows::
  - (a) Exterior windows for the entire Infrastructure Facility shall be cleaned annually.
  - (b) Interior windows shall be cleaned semi-annually at a minimum, or as required, for PPC Spaces.
- (3) PPC shall provide Cleaning Services to all areas and elements within PPC Spaces that cannot be accessed without the use of tools or specialized equipment including:
  - (a) Entrance grills and drains.
  - (b) Glazing, finishes, walls, rails and other architectural elements that require special equipment (including lifts) to access or to clean.

- (4) PPC shall provide deep cleaning services which are part of the overall preventative maintenance for the Infrastructure Facility, including:
  - (a) An annual power-sweeping / power washing of the entire parking and maintenance bay areas.
  - (b) Grease, oil drippings and other stains are to be removed twice per Contract Year with an appropriate degreaser except in Bus parking and maintenance areas.
- (5) Where City conducts cleaning services for surfaces, fixtures, equipment or other assets for which PPC is responsible for maintenance, repair and Renewal Work, PPC shall provide City employees or contractors with appropriate training and guidance on the techniques and products to use in the care of all surfaces, fixtures, and in-contract equipment. If at any time, PPC believes that the maintenance, repair or Renewal Work is being negatively affected by City's cleaning activities, PPC shall immediately identify and notify City in writing their concerns and work with City to rectify or mitigate. If PPC fails to immediately notify City in writing then City shall not be responsible for any maintenance, repair or Renewal Works costs that may result from City cleaning activities.

## **C.6 Maintenance Services**

### **C.6.1. As Built & Drawing Management**

- (1) All As-Built Drawings shall be updated by PPC as required to reflect the Maintenance Services, Renewal Work, or Changes to the Infrastructure Facility. The City will be responsible for making updates, as required, to reflect changes made through SFMTA O&M Services and notify the PPC of such updates. City will not update As-Built Drawings for minor changes to FF&E. The maximum time for completing such updates to the As-Built Drawings shall be two months after completion of the work.
- (2) All drawings shall be maintained by PPC in an electronic format and available in non-proprietary format and access is to be provided to City when requested.
- (3) In addition, PPC shall maintain electronic files and any paper copies in well-organized and indexed system in searchable format. The electronic files must be backed-up off-Infrastructure Facility.

### **C.6.2. Commissioning**

- (1) Commission or re-commission components or systems shall be performed following Maintenance Services based on Good Industry Practice and in particular where they may impact operational efficiency or effectiveness of the system or component.
- (2) Commissioning plans are to be provided to the City for review.
- (3) Results of commissioning activities are to be provided to City for their information.

### **C.6.3. Scheduling of Maintenance Services**

- (1) PPC shall provide City with a monthly schedule at least 1 month in advance of Scheduled Maintenance activities being carried out.
- (2) PPC may only carry out its Maintenance Services obligations as follows:
  - (a) Demand Maintenance required to address an Emergency may be undertaken by PPC as needed to protect life and property. PPC Shall notify the city as soon as possible before or after the Demand Maintenance in accordance with agreed communication plans.
  - (b) Maintenance Services which do not impact SFMTA O&M Services can be undertaken at any time.
  - (c) If PPC has Scheduled Maintenance and City determines that it will disrupt SFMTA O&M Services or other City planned activities and requests PPC to modify its maintenance schedule or activities, then PPC will accommodate such change in the performance of its Maintenance Services obligations unless otherwise approved by City.

### **C.6.4. Graffiti & Vandalism**

- (1) PPC shall work jointly with City to minimize and appropriately manage acts of graffiti and Vandalism.
- (2) PPC shall remove graffiti that is publicly visible or offensive within 24 hours. All other graffiti shall be removed within 72 hours.
- (3) PPC shall repair and rectify all acts of Vandalism based on the Response Time and Rectification Time and the Vandalism's classification as Priority 1, Priority 2 or Priority 3 depending on the Vandalism's impact on the Infrastructure Facility or SFMTA O&M Services.

### **C.6.5. Demand Maintenance Activity**

- (1) PPC shall respond to Demand Maintenance requests or requirements as they are identified, whether from City, Building Occupants or as a result of PPC activity.
- (2) PPC shall ensure all Demand Maintenance activity is documented and tracked electronically in the Help Desk system for performance evaluation and to provide information for analysis and reporting. Where relevant, Demand Maintenance activity shall be documented with the relevant asset receiving Demand Maintenance activity.

### **C.6.6. Scheduled Maintenance Activity**

- (1) PPC shall provide a comprehensive Scheduled Maintenance program with Scheduled Maintenance activities for all Maintained Elements and also legislative compliance routines and major activities for all IFM Services.

- (2) All relevant assets shall be included in a CAFM to track both Scheduled Maintenance and actual work performed, including relevant operational measurements and observations related to the asset receiving Scheduled Maintenance activity.
- (3) An annual audit shall be conducted on all assets due no later than the anniversary date of occupancy.
- (4) The CAFM system shall track document work orders generated and work orders completed within each planned period for performance reporting.
- (5) The CAFM system shall record and maintain the following information on the assets:
  - (a) A logical, hierarchical based identification method for systems and components.
  - (b) Description of each system / component, (i.e. make, model, serial #, capacity, etc.)
  - (c) Physical location of the asset (i.e. room number as relevant)
  - (d) Scheduled Maintenance tasks with detailed description
  - (e) Frequency and scheduled dates for tasks / components
  - (f) Maintenance history including Scheduled Maintenance and Demand Maintenance and Renewal Work activity along with notes, recommendations, observations, etc.
  - (g) Resources dispatched
  - (h) Date work order produced, due and completed, for performance reporting purposes

## **C.6.7. Scheduled Maintenance Plans**

### **C.6.7.1. 1 Year Scheduled Maintenance Plan**

- (1) PPC shall provide a 1 year Scheduled Maintenance Plan with detailed schedule which highlights IFM Services activities which may impact SFMTA O&M Services, identify implications and provide plans on how the potential impact will be mitigated or eliminated. The 1 Year Scheduled Maintenance Plan is to be provided at least 3 months prior to the start of the Contract Year at the IFM Operations Committee.

### **C.6.7.2. 5 Year Scheduled Maintenance Plan**

- (1) PPC shall provide a 5 year Scheduled Maintenance Plan which identifies all major IFM Services activities which may impact SFMTA O&M Services. The 5 Year Scheduled Maintenance Plan is to be provided at least 3 months prior to the start of the Contract Year at the IFM Operations Committee.

## C.7 Service & Maintenance Requirements

### C.7.1. Infrastructure Facility Envelope

- (1) This section refers to all the Elements of the Infrastructure Facility envelope, which include roof systems, walls, doors, and windows, subject to Reasonable Wear and Tear

### C.7.2. Roof Systems

- (1) A roof is the system of interacting components and materials designed to weatherproof and insulate the top surface of the Infrastructure Facility including all structural components, roof fabric, flashings, copings, vents, drains, stacks, parapets and other penetrations. In addition, the roof system includes eaves and fascia.
- (2) PPC shall properly maintain the roof system of the Infrastructure Facility to ensure that the roof system:
  - (a) Meets the Availability Conditions and Performance Requirements applicable to the roof system;
  - (b) Functions and operates safely and performs in accordance with these IFM Specifications and otherwise as required by the Technical Requirements;
  - (c) Meets all Applicable Laws and Standards and Regulatory Approvals; and
  - (d) Meets the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the roof system of the Infrastructure Facility to ensure that:
  - (a) The roof is weather tight with continuity of membrane and sealant;
  - (b) The roof is structurally sound, with a uniform and even surface;
  - (c) The roof is free of Defects affecting performance or safety;
  - (d) Coverage is continuous and complete across entire surface of the roof of the Infrastructure Facility;
  - (e) The roof is free of leaks, damp penetration, spalling, noticeable sagging, decay, cracks, rust, corrosion, damage, distortion or displacement and mold;
  - (f) All parts of the roof system are tightly fastened and structurally sound;
  - (g) Eaves and fascia are structurally sound and secure;
  - (h) Roof drainage is free flowing and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (i) Drains and vents are free of debris and obstruction;

- (j) Water is dispersed from the roof in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (k) The insulation is intact, dry and performing in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements; and
  - (l) Any other performance requirement set out in these IFM Specifications and otherwise in accordance with the Technical Requirements are being met.
- (4) PPC shall regularly inspect roof systems in accordance with the Maintenance Plan, including Thermographic scans (and cut samples, if necessary)

### **C.7.3. Exterior Walls and Foundations**

- (1) Exterior walls and foundations include all structural components, claddings, cappings, exhaust and supply vents, chimney stacks and flues, drainage systems, soffits, other penetrations and attachments, such as landings, ramps, stairwells, fire exits, steps, porches, decks, walkways, entrances, safety barriers (bollards), walkways and insulation.
- (2) PPC shall properly maintain the exterior walls and foundations of the Infrastructure Facility to ensure that the exterior walls and foundations:
  - (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the exterior walls and foundation of the Infrastructure Facility to ensure that:
  - (a) The foundation is structurally sound, and free of Defects affecting performance of the foundation or safety;
  - (b) There is no subsistence or differential settlement of the foundation;
  - (c) The exterior walls and foundation are weather tight with continuity of material across the entire surface;
  - (d) The exterior walls, attachments and the foundation are free from hazardous materials, cracks, deflections, rust, corrosion, damage, distortion or displacement;
  - (e) The exterior walls are free from leaks and dampness penetration and mold;
  - (f) The exterior walls are uniform in color and pattern;
  - (g) All structural components of the exterior walls are structurally sound and securely fastened;

- (h) All joints and penetrations to the exterior walls and foundations are properly sealed, weather tight and performing in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (i) Chimney stacks and flues are structurally sound and secure and the flue is free from blockages and excess soot;
  - (j) Drainage systems are free flowing, with no blockages;
  - (k) Exhaust and supply vents are free of any blockages; and
  - (l) Attachments to the exterior walls and foundations shall be structurally sound, securely fastened and functioning in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements.
- (4) PPC shall regularly inspect all exterior walls in accordance with PPC's Maintenance Plan. All repairs and renewals of the exterior walls and foundation performed by PPC shall meet these IFM Specifications and otherwise in accordance with the Technical Requirements and all Applicable Laws and Standards.

#### **C.7.4. Exterior Doors**

- (1) Exterior doors includes all entrances, including steel, aluminum or wood doors and frames, overhead and coiling doors, automatic entrances, door tracks and jambs, air vents, other ventilation outlets, glass, kick plates and finishes, as well as all door hardware components, including, hinges, locks, catches, door closers and handles, weather stripping, electronic hardware parts and strikes and all overhead door opening equipment, controls and wiring.
- (2) PPC shall properly maintain the exterior doors to ensure that the exterior doors:
  - (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the exterior doors to ensure that:
  - (a) The exterior doors are weather tight;
  - (b) The exterior doors are free of Defects affecting performance, safety and security;
  - (c) The exterior doors are intact, properly fitted, open and close freely without scraping or binding and latch securely and seal tightly when closed;
  - (d) Door finishes are uniform in color and free from peeling, scratches, chips or other similar damage.

- (e) Door tracks, doorjambes and all door hardware items including hinges, locks, closers, catches and handles are securely fastened and operate without binding, rubbing or catching in any way;
  - (f) Air vents, grills and other ventilation outlets are not blocked;
  - (g) Exterior door glass is complete and free of cracks, chips or other damage;
  - (h) All hardware and other attachments are fastened securely with no loose or missing parts and glass and, where applicable, are free of cracks or broken pieces; and
  - (i) The exterior doors are secure, with the door security system fully operational at all times.
- (4) Any damage to an exterior door that prevents the Infrastructure Facility from being secured is deemed to be a Priority 1 Failure. Temporary Repairs in accordance with the Agreement that ensure adequate security of the Infrastructure Facility will not be unreasonably refused by City.
- (5) PPC shall regularly inspect all exterior doors in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the exterior doors to meet these Technical Requirements, all applicable Laws and the relevant Standards and Guidelines.

### **C.7.5. Exterior Windows**

- (1) Exterior windows include standard and specialized windows, curtain wall windows and entrance windows including glazing, seals, frames, tracks, ledges and finishes as well as motorized window blinds supplied by PPC.
- (2) PPC shall properly maintain the exterior windows of the Infrastructure Facility to ensure that the exterior windows:
  - (a) Function and operate safely and perform in accordance with these Technical Requirements;
  - (b) Meet all applicable Laws and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the exterior windows to ensure that:
  - (a) The exterior windows operate to manufacturers' specifications;
  - (b) The exterior windows are safe and are free of Defects affecting performance and security;
  - (c) The exterior windows are intact and properly fitted and sealed;
  - (d) The exterior windows are weather tight and free of condensation;
  - (e) The exterior windows, frames, tracks and ledges are securely fastened and free from cracks, breaks, thermal seal failures or other impairments;

- (f) All movable components operate freely and easily with no loose or missing parts;
  - (g) Where applicable, exterior windows open and close without binding; and
  - (h) Exterior windows and components are uniform in color and free from corroded or cracked finishes or cracked, broken or twisted frames.
- (4) PPC shall maintain motorized window blinds to ensure they:
- (a) Are complete and securely fixed;
  - (b) Are free of noticeable sagging;
  - (c) Are properly fitted providing complete coverage;
  - (d) Open and close properly;
  - (e) Meet the manufacturer's performance requirements; and
  - (f) Are free from tears, holes or other similar damage
- (5) Any exterior window that is broken (beyond cracking or chipping) shall be deemed to be a Priority 1 Failure. Temporary Repairs in accordance with the Agreement that ensure adequate security of the Infrastructure Facility will not be unreasonably refused by the City.
- (6) PPC shall regularly inspect all exterior windows and motorized window blinds in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the exterior windows and motorized window blinds to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.6. Infrastructure Facility Interior**

- (1) The Infrastructure Facility interior includes ceilings, walls, floors and floor coverings, fixtures and fittings, doors, windows and finishes.

### **C.7.7. Ceilings**

- (1) Ceilings include all ceiling materials and components, including, acoustic tile, gypsum board or metal linear ceiling surfaces and all structural support frames and components.
- (2) PPC shall properly maintain the ceilings to ensure that the ceilings:
- (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.

- (3) In addition, PPC shall maintain the ceilings to ensure that:
  - (a) The ceilings are intact, properly fitted and sealed, and are structurally sound and secure;
  - (b) The ceilings are complete and level, with a uniform and even surface;
  - (c) Ceiling joints are flush with no loose, missing or broken pieces or components;
  - (d) The ceilings have no noticeable cracks, damaged finishes, deflections, water marks, staining or damp surfaces;
  - (e) The ceilings are free from mold, asbestos and other hazardous materials;
  - (f) The ceilings are uniform in color and pattern with finishes continuous over the surface; and
  - (g) The ceilings are free of any impairment which would pose a safety hazard.
- (4) PPC shall regularly inspect all ceilings in accordance with PPC's Maintenance Plan. PPC shall perform all repairs and renewals of the ceilings to meet these Technical Requirements, all applicable Laws and the relevant Standards and Guidelines.

### **C.7.8. Interior Walls and Partitions**

- (1) Interior walls and partitions include all interior walls, partitions, components and finishes and all supporting elements.
- (2) PPC shall properly maintain the interior walls and partitions to ensure that the interior walls and partitions:
  - (a) Function and operate safely and perform in accordance with these Technical Requirements;
  - (b) Meet all applicable Laws and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the interior walls and partitions to ensure that:
  - (a) The interior walls are structurally sound and safe;
  - (b) The interior walls are adequately protected, uniform and have an even surface;
  - (c) The interior walls are free from asbestos and other hazardous materials;
  - (d) The interior walls and partitions have continuity of material across its entire surface;
  - (e) The interior walls and partitions are free from cracks, deflections, damage, distortion or displacement;
  - (f) The interior walls and partitions are free from dampness and mold;

- (g) Finishes and coverings are complete, uniform in color and pattern and are free from peeling, rips, tears or discoloration.
  - (h) Ventilation penetrations are not blocked;
  - (i) The interior wall tiling and backsplashes are water tight and free of chipping or lifting; and
  - (j) The interior wall penetrations, including ventilation grills, are securely fastened.
- (4) PPC shall regularly inspect all interior walls and partitions in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the interior walls and partitions to meet these Technical Requirements, all Applicable Laws and Standards.

### **C.7.9. Floors**

- (1) Floors include hard floors including ceramic tile, terrazzo, concrete and wood flooring, resilient flooring, recessed entry mats and all soft or carpeted floors.
- (2) PPC shall properly maintain the floors to ensure that the floors:
  - (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the floors to ensure that:
  - (a) The floors are structurally sound, intact and properly fitted;
  - (b) The floors are fully supported at all bearing points;
  - (c) The floors are water tight with no damp spots;
  - (d) The floors have no subsidence or differential settlement;
  - (e) The floors and support systems are free of holes, tears, scoring, cracks, breaks, uneven surfaces, heaving or other impairments;
  - (f) The floors do not creak or squeak;
  - (g) Floor coverings are to be fully adhered to the floor, do not pose any tripping or other safety hazard and are uniform in color and pattern.
  - (h) Flooring does not bubble, blister or stretch;
  - (i) There is no lifting, tears or cracking at joints or corners;
  - (j) Repairs, patches and replacements shall match the color and pattern of existing floor coverings;

- (k) Recessed entry mat frames are properly fitted with no tripping hazards or loose parts;  
and
  - (l) Recessed entry mats are functioning as intended, without material deterioration or wearing.
- (4) PPC shall regularly inspect all floors and floor coverings in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the floors and floor coverings to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.10. Fixtures, Fittings, Millwork and Equipment**

- (1) Fixtures, fittings, millwork and equipment include all fixed in place millwork such as overhead cabinets, cupboards, counters, storage cabinets, bookcases as well as the doors, drawers and shelving and related hardware, bathroom, toilet and change / locker room partitions, lockers and benches.
- (2) PPC shall properly maintain the fixtures, fittings, millwork and equipment to ensure that the fixtures, fittings, millwork and equipment:
  - (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the fixtures, fittings, millwork and equipment to ensure that:
  - (a) Fixtures, fittings and millwork are intact with no missing or damaged parts;
  - (b) Equipment is fully operational, with no missing or damaged parts;
  - (c) Fixtures, fittings, millwork and equipment are properly secured, fastened and fitted;
  - (d) All finishes and countertop surfaces are firmly attached and free from discoloration or broken pieces;
  - (e) Cabinet doors and drawers open and close freely;
  - (f) Cabinet hardware operates smoothly with no missing parts;
  - (g) Washroom and change / locker room partitions, doors and lockers are securely fastened;
  - (h) Washroom and change / locker room partition, door and locker finishes are free from peeling and uniform in color;
  - (i) Washroom and change / locker room doors and locker doors swing freely, closing and locking without binding;

- (j) Equipment performs to manufacturers' specifications;
- (k) Interior signage provided by PPC is legible and securely fastened in place; and minimum repair or replacement size is one matching length, sheet or single component.
- (l) PPC shall regularly inspect the fixtures, fittings, millwork and equipment in accordance with the Maintenance Plan. Equipment shall be maintained in accordance with manufacturers' specifications. PPC shall perform all repairs and renewals of the fixtures, fittings, millwork and equipment to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.11. Interior Doors**

- (1) Interior doors include hollow metal, steel and solid or hollow wood core doors, and all associated hardware and components such as door frames, tracks and jambs, hinges, locks, catches, closers, handles and glass, where applicable.
- (2) PPC shall properly maintain the interior doors to ensure that the interior doors:
  - (a) function and operate safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements,
  - (b) meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the interior doors to ensure that:
  - (a) the interior doors are free of Defects affecting performance, safety and security;
  - (b) the interior doors are intact, properly fitted, open and close freely, without scraping or binding and shall latch securely when closed;
  - (c) door finishes are uniform in color and free from peeling, scratches, chips or other similar damage.
  - (d) door tracks, doorjambs and all door hardware items including hinges, locks, closers, catches and handles are securely fastened and operate without making noise or binding, rubbing or catching in any way;
  - (e) air vents, grills and other ventilation outlets are not blocked;
  - (f) interior door glass is complete and free of cracks, chips or other damage;
  - (g) all hardware and other attachments are fastened securely with no loose or missing parts and glass and, where applicable, are free of cracks or broken pieces; and
  - (h) minimum repair or replacement size is one matching length, sheet or single component.

- (4) PPC shall regularly inspect all interior doors in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the interior doors to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.12. Interior Windows**

- (1) Interior windows include standard and specialized windows, interior wall windows and entrance windows including all frames, tracks, coverings and ledges that form part of the interior window.
- (2) PPC shall properly maintain the interior windows to ensure that the interior windows:
  - (a) Function and operate safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements.
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the interior windows to ensure that:
  - (a) The interior windows operate to manufacturers' specifications;
  - (b) The interior windows are safe and are free of Defects affecting performance;
  - (c) The interior windows are intact and properly fitted and sealed;
  - (d) The interior windows, frames, tracks and ledges are securely fastened and free from cracks, breaks, missing parts, broken parts or other impairments;
  - (e) All movable components, where applicable, are secure and operate freely and easily with no loose or missing parts; and
  - (f) The interior windows and components are safe and in good operating condition with no broken or cracked glass or other missing or broken parts.
- (4) PPC shall regularly inspect all interior windows of the Infrastructure Facility in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the interior windows shall meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.13. Infrastructure Facility Systems**

- (1) Infrastructure Facility systems include the plumbing system, heating and ventilation system and air conditioning, electrical system, communication system, fire prevention equipment, fire alarm system and elevators.

### C.7.13.1. Plumbing System

- (1) The plumbing system includes:
  - (a) Domestic hot and cold water service including piping system, hot water heater, recirculation pumps and piping and branch piping, non-freeze hose bibbs, supply and drainage lines;
  - (b) Sanitary sewer including piping, traps or interceptors, drainage lines; and
  - (c) Plumbing fixtures including toilets, urinals, flush valves, faucets, sinks, non-refrigerated drinking fountains, shower fixtures.
- (2) PPC shall properly maintain the plumbing system to ensure that the plumbing system:
  - (a) Functions and operates safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meets all applicable Laws and Regulatory Approvals; and
  - (c) Meets the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the plumbing system to ensure that:
  - (a) A constant supply of hot and cold water is produced for sinks, toilets and urinals on demand;
  - (b) Domestic hot water must be generated and distributed at temperatures in accordance with the Technical Requirements;
  - (c) Piping insulation is intact and free from dampness or deterioration to ensure no heat loss;
  - (d) Piping and the parts and components thereof are securely fastened;
  - (e) Piping and the parts and components thereof are free of all drips or leaks;
  - (f) Taps, valves and other related parts and fittings function and operate in accordance with IFM Specifications and otherwise in accordance with the these Technical Requirements;
  - (g) All fixtures, including toilets, urinals, sinks and drinking fountains, showers, etc. are securely fastened, free of all drips or leaks, with all moving parts including taps, flush valves, drain stoppers and water fountains operating freely and easily;
  - (h) All sanitary sewer pipes, drainage traps and interceptors are free flowing and unblocked;
  - (i) The sanitary sewer system provides safe conveyance of sewage or waste to the disposal system and contains the odours produced; and
  - (j) The plumbing system operates with minimal noise and prevents the transmission of discernable vibration into office areas.

- (4) PPC shall regularly inspect the plumbing system in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the plumbing system to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.13.2. Heating and Ventilation System and Air Conditioning**

- (1) The heating and ventilation and air conditioning system includes all equipment and components relating to such system including chillers, HVAC units, boilers, compressors, furnaces, pumps, motors, controls, duct work, vents, mixing boxes and dampers relating to the delivery of heating, cooling, ventilation, air and humidity to the Infrastructure Facility. The heating and ventilation system also includes the BAS.
- (2) PPC shall properly maintain the heating and ventilation system and the air conditioning to ensure that the heating and ventilation system and the air conditioning at the Infrastructure Facility:
  - (a) Functions and operates safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meets all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meets the Handback Requirements at the end of the Term.
- (3) In addition, PPC shall maintain the heating, cooling and ventilation system to ensure that:
  - (a) The heating, cooling and ventilation system operates to prevent the transmission of discernable vibration into office areas;
  - (b) All equipment, parts and components are securely fastened and functioning according to these IFM Specifications and otherwise in accordance with the Technical Requirements to ensure energy efficiency;
  - (c) The heating, cooling and ventilation system meet the performance requirements set out in the Technical Requirements;
  - (d) Humidity, temperature, air flow, air exchange and IAQ is maintained such that it meets the performance requirements set out in the Technical Requirements and otherwise in accordance with the Performance Requirements;
  - (e) All duct work and controls functions without air leakage;
  - (f) Piping and equipment operates with no missing parts;
  - (g) Piping and equipment is free of leaks, rust or corrosion;
  - (h) Where applicable, insulation is intact and free of damage or holes;
  - (i) Filtration media is maintained and replaced as necessary to maintain indoor air quality and the efficient operation of the heating and ventilation system;

- (j) The BAS is maintained to ensure optimum operation of the heating, cooling and ventilation system and electrical system, including:
    - i. resetting the air and water supply temperatures;
    - ii. resetting the humidity from outside air; and
    - iii. controlling the lighting and car plugs;
  - (k) The BAS operates in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements and initiates the appropriate alarms as required.
- (4) PPC shall regularly inspect, test, verify and calibrate the heating, ventilation system, air conditioning and BAS in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of the heating and ventilation system, air conditioning and BAS to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

## **C.7.14. Electrical System**

- (1) The electrical system includes interior lighting, exterior lighting and the components described as “Electrical – Other” below.

### **C.7.14.1. Interior and Exterior Lighting**

- (1) Interior and exterior lighting includes all light fixtures, lamps, tubes, luminaires, ballasts, room lighting controls, light poles and emergency and exit lighting.
- (2) PPC shall properly maintain the interior and exterior lighting to ensure that the interior and exterior lighting:
  - (a) Functions and operates safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meets all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meets the Handback Requirements at the end of the Term.
- (3) PPC shall maintain the interior lighting to ensure that:
  - (a) Interior lighting is fully functional and safe;
  - (b) Interior lighting meets the lux levels set out in the Technical Requirements;
  - (c) Flickering or burned out lamps or tubes are replaced;
  - (d) Lamps and tubes operate with no sign of visual deterioration;

- (e) Interior light fixtures are kept securely fastened and free from tarnishing, cracks, chips, peeling or other similar damage;
  - (f) All shades, light switches and controls are free of cracks, breakage, chips or similar damage;
  - (g) Lighting controls operate in accordance with manufacturers' specifications and in accordance with IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (h) Emergency and exit lighting is kept fully charged and operational at all times;
  - (i) Emergency and exit lighting meets the requirements of the applicable legislative requirements;
  - (j) All other interior lighting parts and components meet all Applicable Law and Standards; and
  - (k) Interior lighting does not create a fire hazard.
- (4) In addition, PPC shall maintain the exterior lighting to ensure that:
- (a) Exterior lighting is fully functional and safe;
  - (b) Exterior lamps and tubes are replaced when flickering or burned out;
  - (c) Exterior light fixtures and poles are maintained in good operating condition;
  - (d) Exterior light fixtures are kept clean and in good repair with no visible corrosion, peeling or discoloration;
  - (e) Exterior light fixtures have no missing or broken parts;
  - (f) Exterior light fixtures and poles are structurally sound and operate safely;
  - (g) Exterior light poles shall be maintained plumb within 0.5 inches in 3.5 feet;
  - (h) Exterior light covers shall be secure and free from cracks, broken or missing parts or discoloration; and
  - (i) Exterior lighting does not create a fire hazard.
- (5) PPC shall regularly inspect and test the interior and exterior lighting in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of interior and exterior lighting shall meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.14.2. Electrical – Other**

- (1) “Electrical – Other” includes the electrical distribution system, transformers, switchgear, switchboards and panel boards, electrical distribution panels and controls, feeders, circuit breakers, electrical outlets and receptacles, car plugs and posts, conduit, raceway and wiring. “Electrical – Other” also includes the emergency lighting system.
- (2) PPC shall properly maintain the components of “Electrical – Other” to ensure that the components of “Electrical – Other”:
  - (a) Functions and operates safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meets all Applicable Laws and Standards Regulatory Approvals; and
  - (c) Meets the Handback Requirements at the end of the Term.
- (3) PPC shall maintain the components of “Electrical – Other” to ensure that:
  - (a) The power distribution system constantly supplies power to the Infrastructure Facility;
  - (b) The power distribution system provides a safe and sufficient power supply in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (c) The power distribution system functions as designed, without undue noise or vibration;
  - (d) The main distribution system equipment and components is fully operational and free of Defects that affect proper operation of the system;
  - (e) All raceways, conduit, boxes, wiring, fittings, fixtures, controls and safety devices are fully operational, securely fastened to their intended point of anchorage and labeled in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (f) All electrical outlets and receptacles shall be operational with no broken, missing or loose parts;
  - (g) The emergency lighting system is operational and functioning in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements.
- (4) The components of “Electrical – Other” shall be regularly inspected and tested in accordance with the Maintenance Plan. All repairs and renewals of the components of “Electrical – Other” shall meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all applicable Laws and Standards.

### **C.7.14.3. Communications Systems**

- (1) Communication systems include the security system, clock system, parking controls as well as all ICT conduit and raceways required to be provided by PPC pursuant to these IFM Specifications and otherwise in accordance with the Technical Requirements.

- (2) PPC shall properly maintain the communication systems to ensure that the communication systems:
  - (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (3) PPC shall maintain the communication systems to ensure that:
  - (a) All systems operate and perform in accordance with the manufacturers' specifications, recommendations, and these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) The security system is fully operational and initiates alarms in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements; and
  - (c) ICT conduit and raceways shall be intact, functional and securely fastened at all times.
- (4) PPC shall regularly inspect and test the systems in accordance with the Maintenance Plan. PPC shall perform all repairs and renewals of any communication system to meet these IFM Specifications and otherwise in accordance with the Technical Requirements, all Applicable Laws and Standards.

### **C.7.15. Fire Prevention Equipment and Fire Alarm System**

- (1) Fire prevention equipment includes all fire safety systems and equipment, such as fire sprinklers, standpipe and hose networks, and fire extinguishers (including carbon dioxide, wet chemical, dry chemical, clean agent and foam extinguishers).
- (2) The fire alarm system includes the fire alarm system control panel, heat and smoke detectors, pull stations, alarms, annunciators and all associated wiring and equipment.
- (3) PPC shall properly maintain the fire prevention equipment and fire alarm system to ensure that the fire prevention equipment and fire alarm system:
  - (a) Function and operate safely and perform in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meet all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meet the Handback Requirements at the end of the Term.
- (4) PPC shall maintain the fire prevention equipment and fire alarm system to ensure that:
  - (a) The fire prevention equipment and fire alarm system are fully functional and operating as designed;

- (b) Fire prevention equipment and fire alarm system are maintained, repaired and updated, as required, to ensure it is in compliance with these IFM Specifications and otherwise in accordance with the Technical Requirements and all Applicable Laws and Standards;
  - (c) Sprinkler systems and components shall be free of leaks and damage, with all parts functioning and operational in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements; and
  - (d) Fire extinguishers and other firefighting equipment are maintained in accordance with all Applicable Law and Standards.
- (5) Suitable systems and procedures shall be established and maintained by PPC to ensure that all fire prevention equipment is examined and tested, with the records of all such tests and the dates thereof prepared in an accurate and sufficiently detailed manner. PPC shall ensure that the fire protection equipment and fire alarm system is regularly monitored in accordance with the Maintenance Plan and tested in accordance with all Applicable Laws and Standards and Regulatory Approvals.

## **C.7.16. Elevators**

- (1) Elevators include the elevator cab, cabling, telephone, indicator lights, call buttons, door openers, controllers, pit drains, and all parts and components thereof.
- (2) PPC shall properly maintain the elevators to ensure that the elevator:
  - (a) Functions and operates safely and performs in accordance with these IFM Specifications and otherwise in accordance with the Technical Requirements;
  - (b) Meets all Applicable Laws and Standards and Regulatory Approvals; and
  - (c) Meets the Handback Requirements at the end of the Term.
- (3) PPC shall maintain the elevator to ensure that:
  - (a) The elevator is operational and available for use;
  - (b) The elevator car moves smoothly;
  - (c) The elevator car levels properly at each floor, without tripping hazards;
  - (d) The doors opening smoothly without binding;
  - (e) All elevator safety devices function properly;
  - (f) All parts and components, including indicator lights, call buttons, emergency telephone, door openers and controllers and performance such as speed operate in accordance with these Technical Requirements; and
  - (g) The elevator door and passenger compartment finishes must be free from peeling or discoloration and, where applicable, paneling must be securely fastened.

- (4) PPC shall ensure that the elevator is regularly maintained by qualified personnel. PPC shall ensure that the elevator shall be inspected annually in accordance with applicable Laws and Regulatory Approvals.
- (5) PPC shall immediately respond to all elevator alarms or telephone calls from an elevator and immediately initiate the required action to release trapped individuals.
- (6) In the event of failure in the operation of the elevator, trapped individuals must be released from the elevator as soon as practicable but in any event no later than one hour from notification.

## Section D - Ad Hoc Services

- (1) PPC shall provide Ad-Hoc Services on an as-requested and non-exclusive, fee for services basis. City has the right to procure services from alternate suppliers. Where City procures and manages the services, PPC may be responsible for coordination, reviewing plans, etc.
- (2) Fees for services provided shall be provided at market rates with only an agreed mark-up for Ad-Hoc services.
- (3) All Ad-Hoc Services must be pre-authorized in accordance with agreed procedures and policy. PPC shall not be compensated for costs incurred where work is performed without pre- authorization.
- (4) Ad Hoc Services will be initiated through the Help Desk by authorized City Representatives. Where requests are received from non-authorized individuals, PPC will advise the individuals to follow the established procedures.
- (5) PPC shall work with City to ensure the scope, definition of requirements, schedule and budgets, where applicable, are established prior to proceeding with the work.
- (6) If the request has an impact on the Infrastructure Facility or the IFM Project Site, PPC shall advise City of the impact and where necessary, Article 12 (City Change Process, Unilateral Change Orders, Deviation) of the Agreement will apply.
- (7) The fees for work performed as Ad-Hoc Services shall be included in the monthly invoice to City with a separate itemization and back-up documentation as agreed with City.
- (8) The Ad-Hoc Services includes the following services.
  - (a) Installation, relocation or removal of pictures, white boards or other similar items attached to the walls.
  - (b) Set-up, reconfiguration and arrangement of furniture and modular units as necessary.
  - (c) Minor moves, including reconfiguration or setup of furniture, moving and related infrastructure such as cabling and power provision.
  - (d) Minor furniture repairs.
  - (e) Support for and/or installation of audio visual or telecommunications or equipment.
  - (f) Key cutting and removing broken keys from locks.
- (9) Additional services may be requested by City and provided at the option of PPC.

## Section E - Renewal Work

### E.1 General Requirements

- (1) The objective of the Renewal Work is to ensure the long-term integrity and ongoing operational serviceability of the Infrastructure Facility through the delivery of the Renewal Work Plan which defines design life, specific replacement/refurbishment strategies.
- (2) PPC shall deliver Renewal Work to maintain the standards of the Infrastructure Facility in accordance with the approved Renewal Work Plan and result in an asset condition and Residual Life in accordance with Handback Requirements.
- (1) All standards for replacement or refurbishment as a result of the Renewal shall be in accordance with the Technical Requirements. Where replacements are not available to the required standards, they may be substituted with similar equivalent or higher standard materials or equipment. Substitutions must be fully documented, and equivalence demonstrated to the satisfaction of City.

### E.2 Renewal Work Plans and Reports

- (1) PPC shall:
  - (a) Provide an initial 30-year Renewal Work Plan prior to Substantial Completion identifying the renewal projects planned in each Contract Year. The Renewal Work Plan shall be provided in spreadsheet format with assets identified to the Uniformat II level 3 or equivalent detail by row. For each row, the columns shall indicate the estimated design life with additional columns for each year of the Operating period and the estimated cost for the Renewal Work for each asset in the respective year it is planned. The source may be a software solution however the information must also be provided to the City in spreadsheet format. City and PPC shall agree upon acceptable format of Renewal Work Plan at least 6 months prior to Substantial Completion.
  - (b) Provide a revised Renewal Work Plan to the end of the IFM Period annually as part of the Annual Service Plan, reflecting any changes to the planned projects
  - (c) Provide a Renewal Work schedule for each subsequent Contract Year at least 3 months prior to the commencement of the Contract Year. The s should identify the projects scheduled for that Contract Year, the planned start and completion dates and potential impacts on SFMTA O&M Services. Where schedules have a potential impact on SFMTA O&M Services, City may require PPC to change their schedule and/or provide a plan to demonstrate mitigation of impact or risk to SFMTA O&M Services.
  - (d) Provide a summary of Renewal Work completed or in progress as part of the Annual Service Plan.
  - (e) Provide a summary and status of completed, in progress, and upcoming work in the monthly management reports and meetings.

## **E.3 Commissioning**

- (1) PPC shall commission or re-commission components or systems as required following any Renewal Work activity which may impact operational efficiency or effectiveness of the system or component.

## **E.4 Facility & System Condition Index**

- (1) PPC shall prepare and submit to City every five (5) years a Facility Condition Index (“FCI”) and System Condition Index (“SCI”). The FCI and SCI will be no more than 0.15, unless approved by City and only based on appropriate justification provided by PPC for the deviation and confirmation that the Handback Requirements will be met. The FCI and SCI will be measured and calculated by a third party and be included in the report prepared for the Joint Technical Review.
- (2) The FCI shall be calculated in accordance with accepted industry practice by dividing the maintenance, repair, and replacement of the Infrastructure Facility by the current replacement value of the Infrastructure Facility.

## Section F - Handback Requirements

### F.1 Handback Services

#### F.1.1. General Requirements

- (1) Not earlier than 365 days and not later than 90 days prior to the end of the Term, PPC shall perform and deliver all of the requirements as detailed in this section.
- (2) PPC shall assign a Move-In Manager and attend Move-In meetings as needed by City to ensure transfer of knowledge and information from PPC to City or City's designated entity.
- (3) PPC shall provide training to personnel who may replace PPC personnel. This will include job shadowing and an overlap period of at least two weeks.
- (4) All data and information used in the administration and management of the Infrastructure Facility shall be turned over to City in non-proprietary formats and where systems are currently in use, provide City with an opportunity to licence, or take over the licence, of those systems.

#### F.1.2. Handback Requirements

- (1) At the end of the Term, the PPC shall, at no cost to the City, surrender the Infrastructure Facility to the City in a condition that is as follows:
  - (a) The Infrastructure Facility will be in a condition so that each Maintained Element has a Residual Life of not less than indicated in Appendix C of this Exhibit 18 (Technical Requirements).
  - (b) The performance of the asset shall be at a level commensurate with the performance to be expected from a Well-Maintained Asset and in accordance with the findings and recommendations following the last Joint Technical Review performed. For the purposes of this article a Well-Maintained Asset is defined as an asset that has received regular and demonstrable routine service and Scheduled Maintenance as prescribed by the supplier, manufacturer and/or installer of the asset and whose age-driven performance degradation is no greater than that identified in open-source data published by the supplier, manufacturer and/or installer.
  - (c) Designed and constructed in accordance with the applicable requirements in the Project's Technical Requirements.
  - (d) Managed and maintained in accordance with the applicable requirements set forth in this IFM Specification and the Technical Requirements.
  - (e) Required to achieve an FCI score of 0.10 or less at the end of the IFM Period and as determined by the Handback Requirements defined in this Section.

- (2) At the end of the Term, the PPC shall provide and leave on site the following supplies of spare parts and consumables:
  - (a) A 12 month supply of spare parts based on an analysis of emergency /critical spare part requirements that includes long lead time or specialty items as necessary to ensure reliability and continuous function as well as other spare parts based on the historical consumption of all spare parts.
  - (b) A 12 month supply of consumables for maintenance and repair requirements based on historical consumption.
  - (c) A one month supply of consumables for cleaning, landscaping, pest control and any other non-maintenance and repair services.
  - (d) PPC shall provide an electronic inventory of spare parts and an electronic inventory of consumables with the supply/part description, manufacturer, part number, quantity, location and the supplier.

## F.2 Handback

- (1) PPC shall comply with Section 8.6 of the Agreement with respect to Handback. The Handback Survey may be combined with a Joint Technical Review (JTR) as appropriate depending on timing and in the sole discretion of the City.
- (2) If either the PPC or the City determines from the Handback Inspection that any element of the Infrastructure Facility will not meet the Handback Requirements through the PPC implementing the established Maintenance Plan over the remainder of the IFM Period, within 60 days of completion of the Handback Inspection the PPC will submit to the City the PPC's plan (i.e., a "Handback Requirements Recovery Plan") to perform additional work needed to meet the Handback Requirements at the end of the IFM Period (the "Handback Requirement Recovery Work"). Such a plan will include a schedule and cost estimates for the Handback Requirements Recovery Work, which will be the sole responsibility of the PPC under the terms of the Project Agreement.
- (3) The City may review and comment on the Handback Requirements Recovery Plan. Such review includes the adequacy of the Handback Requirements Recovery Work and reasonableness of the PPC's schedule and cost for the proposed Handback Requirements Recovery Plan implementation.

## Section G - Performance Measurements

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
Sect.B	General Management Services Management and Administration	PPC to provide administrative and management services in accordance with these IFM Specifications	MED	N/A	N/A	Per Failure Event	5	\$300
B.8.1.2	General Management Services Management and Administration	IFM Manager (or designate) provided by PPC for the Infrastructure Facility available and contactable 24 hours, 365(6) days/year	MAJOR	N/A	N/A	Per Calendar Day	10	\$650
B.17	General Management Services Management and Administration	PPC shall at all times have in place the Performance Monitoring Program for all of the IFM Services in accordance with these IFM Specifications	MAJOR	N/A	N/A	Per Calendar Day	10	\$650
B.8.1.6	General Management Services Management and Administration	All PPC employees and Contractor employees have received orientation training prior to starting work.	MED	N/A	N/A	Per Calendar Day	5	\$300

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
Sect.B	General Management Services Management and Administration	All PPC employees are appropriately trained, and records maintained in accordance with these IFM Specifications	MED	N/A	N/A	Per Contract Month	5	\$300
B.8.1.2	General Management Services Management and Administration	Proof of licenses, qualifications and registrations provided to City Representative for all PPC Staff annually.	MAJOR	N/A	N/A	Per Failure Event	10	\$650
B.18	General Management Services Management and Administration	Compliance with all Applicable Law and Standards.	MAJOR	N/A	N/A	Per Failure Event	10	\$650
B.8.1.6	General Management Services Reporting	Prepare, submit and update Service Reports in accordance with these IFM Specifications.	MED	N/A	N/A	Per Failure Event	5	\$300
B.8.1.5	General Management Services Reporting	Prepare, submit and update Performance Monitoring Report in accordance with these IFM Specifications.	MAJOR	N/A	N/A	Per Contract Month	10	\$650
B.14 (4)	General Management Services Reporting	The status on all statutory testing is reported to City on a monthly basis or as per applicable Law.	MAJOR	N/A	N/A	Per Contract Month	10	\$650

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
B.3	General Management Services IFM Services Procedures & Documentation	Prepare, submit and update all IFM Services Procedures in accordance with these IFM Specifications	MED	N/A	N/A	Per Failure Event	5	\$300
B.10	General Management Services IFM Services Procedures & Documentation	Prepare, submit and update the IFM Services Procedures.	MAJOR	N/A	N/A	Per Failure Event	10	\$650
B.18	General Management Services IFM Services Procedures & Documentation	Prepare, submit and update 5-Year and detailed 1 Year Scheduled Maintenance Plans in accordance with these IFM Specifications	MAJOR	N/A	N/A	Per Non	10	\$650
B.3	General Management Services IFM Services Procedures & Documentation	Prepare, submit and update Renewal Work Plans in accordance with these IFM Specifications.	MAJORx2	N/A	N/A	Per Non	20	\$1300
B.6	General Management Services IFM Services Procedures & Documentation	Maintain appropriate records in relation to all PPC permits, licenses and approvals.	MAJORx2	N/A	N/A	Per Failure Event	20	\$1300

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
B.6.1(4)	General Management Services IFM Services Procedures & Documentation	Update all As-Built drawings in accordance with these IFM Specifications	MAJORx2	N/A	N/A	Per Failure Event	20	\$1300
C.6.7.1 C.6.7.2	Move-In Services	Provision of Move-In In Services in accordance with these IFM Specifications	MED	N/A	N/A	Per Failure Event	5	\$300
E.2	Move-In Services	Prepare, submit and update Move-In Plan in accordance with these IFM Specifications	MAJORx2	N/A	N/A	Once	20	\$1300
B.3	Move-In Services	Staff involved in Move-In in accordance with these IFM Specifications	MEDx2	N/A	N/A	Per Failure Event	10	\$600
C.6.1	Help Desk Services	Help Desk Services provided in accordance with these IFM Specifications.	MEDx2	N/A	N/A	Per Calendar Day	10	\$600
B.25	Help Desk Services	Service Requests and transactions are categorized and recorded in accordance with these IFM Specifications	MAJORx2	N/A	N/A	Per Failure Event	20	\$1300
B.25.1(3)	Help Desk Services	The Help Desk Service (by phone and web) is available 24 hours per day, 365(6) days per year.	MAJORx2	N/A	N/A	Per Calendar Day	20	\$1300

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
B.25.1(1)	Utilities Management Services	Utilities Management Services are delivered in accordance with these IFM Specifications	MED	N/A	N/A	Per Failure Event	5	\$300
B.19	Utilities Management Services	Monthly Utility Analysis conducted in accordance with these specifications.	MAJORx2	N/A	N/A	Per Contract Month	20	\$1300
B.19.2(2)	Environmental Management Services	Environmental Management Services are delivered in accordance with these IFM Specifications	MED	N/A	N/A	Per Failure Event	5	\$300
B.19.20	Environmental Management Services	PPC shall put programs in place to ensure monitoring, inspection, testing, handling, storage and clean up as required for all elements of the EMS.	MEDx2	N/A	N/A	Per Calendar Day	10	\$600
B.21	Environmental Management Services	No environmental releases, spills or noncompliance.	MAJOR	N/A	N/A	Per Event	10	\$650
B.21	Environmental Management Services	Prepare, submit and update an annual environmental compliance statement	MAJORx2	N/A	N/A	Per Non	20	\$1300
B.22	Environmental Management Services	Achieve LEED EBOM certification as per these IFM Specifications	MAJORx2	N/A	N/A	Per Calendar Week	20	\$1300
B.22.2	Emergency Management Services	Emergency Management Services are delivered in accordance with these IFM Specifications	MEDx2	N/A	N/A	Per Failure Event	10	\$600

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
B.22	Emergency Management Services	PPC has at all times its own contingency plan in place.	MAJORx2	N/A	N/A	Per Failure Event	20	\$1300
B.22.2(2)	Emergency Management Services	PPC has response and mitigation plans for emergency situations in accordance with these IFM Specifications.	MAJORx2	N/A	N/A	Per Failure Event	20	\$1300
B.22.4(2)	Emergency Management Services	PPC has comprehensive fire management plan in place at all times.	MAJORx2	N/A	N/A	Per Failure Event	20	\$1300
B.23	Quality & Performance Management Services	Maintain and use an IFM Management Plan to manage quality in accordance with these IFM Specifications	MEDx2	N/A	N/A	Per Calendar Day	10	\$600
B.23.3.2	Quality & Performance Management Services	Conduct quality inspections in compliance with the IFM Quality Management Plan.	MAJORx2	N/A	N/A	Per Contract Quarter	20	\$1300
B.23.2	Quality & Performance Management Services	Conduct occupant satisfaction surveys in accordance with these IFM Specifications	MAJORx2	N/A	N/A	Per Contract Year	20	\$1300
B.23	Quality & Performance Management Services	Conduct transaction satisfaction surveys in accordance with these IFM Specifications	MAJORx2	N/A	N/A	Per Contract Quarter	20	\$1300

REF.	Service	Measure	LEVEL	Response	Rectification	FREQ.	Points	Penalty
B.16	Quality & Performance Management Services	Provide action plan(s) as required by these IFM Specifications	MEDx2	N/A	N/A	Per Failure Event	10	\$600
B.16(2)(f)	Quality & Performance Management Services	Implement action plan(s) as agreed between the City and PPC.	MEDx2	N/A	N/A	Per Failure Event	10	\$600
B.16	Quality & Performance Management Services	% satisfaction score for each service category on the occupant satisfaction survey no more than 5% lower than the baseline.	MAJORx2	N/A	N/A	Per Contract Quarter	20	\$1300
B.16	Quality & Performance Management Services	% satisfaction score for the Transaction Satisfaction Survey no more than 5% lower than the baseline.	MAJORx2	N/A	N/A	Per Contract Quarter	20	\$1300
B.16.3(b)	Maintenance Services	Landscaping Services are delivered in accordance with these IFM Specifications	MED	N/A	N/A	Per Failure Event	5	\$300
B.16.3(c)	Cleaning Services	Cleaning Services are delivered in accordance with these IFM Specifications.	MED	N/A	N/A	Per Failure Event	5	\$300
B.16.1	Solid Waste Collection, Recycling and removal Services.	Solid Waste Collection, Recycling and Removal Services are delivered in accordance with these Specifications	MED	N/A	N/A	Per Failure Event	5	\$300

## Appendix A – Space Tolerances

The below document established tolerance levels whereby deviations from the Performance Requirements ('Design') established in Division 3 (Design Criteria) of Exhibit 18 (Technical Requirements), constitute Service Failures or Availability Failures, as required.

### Temperature Tolerances:

For the purposes of interpreting the Table 1 – Performance Parameters for Space Temperatures below:

- A Service Failure will occur if the temperature is outside of the Performance Tolerance range. For greater clarity, a Service Failure will not occur if the temperature is within the provided range ('+/-')
- An Availability Failure will occur if the temperature is below the Availability Threshold in Winter, or exceeds the Availability Threshold in Summer
- Note that these tolerances are required during core hours only – City to agree with PPC on appropriate setback times during Commissioning.

Table 1 – Performance Parameters for Space Temperatures

Area/Item	Winter Parameters			Summer Parameters		
	Design	Performance Tolerance	Availability Threshold	Design	Performance Tolerance	Availability Threshold
<b>1. Office Areas</b>						
Office Areas	68°F	+/-4°F	62°F	74°F	+/-4°F	80°F

## Bus Wash Floor Area Heating

For the purposes of the Bus Wash Floor Area Heating Area:

- An Availability Failure will occur when the temperature drops below the minim design tolerance of 49°F

## Ventilation Tolerances:

For the purposes of ventilation, performance will be monitored through space temperature.

## Lighting Levels:

For the purposes of Space Lighting:

- A Service Failure will occur when the lighting is below the Minimum Design as identified in Table 1 – Performance Parameters for Space Temperatures below, during core hours only
- An Availability Failure will occur when lighting level is below the Minimum Design and deemed to be unsafe for work, as determined by the City, at all times.

Table 2 – Performance Parameters for Space Lighting

Area/Item	Lighting Parameters		
	Minimum Design (fc)		Comment
<b>10.Shared</b>			
Building Eng/Building Storage	20		
Security Office	35		
Lobby	35		

## Plumbing Systems:

For the purposes of Domestic Hot Water:

- A Service Failure will occur if the temperature is outside of the Performance Tolerance range as identified in Table 3 – Performance Parameters for Domestic Hot Water, but below the Availability Threshold. For greater clarity, a Service Failure will not occur if the temperature is within the provided Performance Tolerance range ('+/-')
- An Availability Failure will occur if the temperature is outside of the Availability Threshold range

**Table 3 – Performance Parameters for Domestic Hot Water**

Item	Design	Performance Tolerance	Availability Threshold
Domestic Hot Water	140°F	+/-5°F	+/-15°F

For the purposes of Shower Water Temperatures:

- A Service Failure will occur if the temperature is below the minimum Performance Threshold but equal to or greater than the minimum Availability Threshold as identified in Table 4 – Performance Parameters for Shower Temperature below. Alternatively, a Service Failure will also occur if the temperature is above the maximum Performance Threshold but equal to or below the maximum Availability Threshold.
- An Availability Failure will occur if the temperature is below the minimum Availability Threshold or above the maximum Availability Threshold
- Note the above Performance Requirements are to apply within the limits of the final system capacity

**Table 4 – Performance Parameters for Shower Temperature**

	Performance Thresholds		Availability Thresholds	
	Min	Max	Min.	Max.
Shower Water Temperature	100°F	105°F	95°F	110°F

For the purposes of Compressed Air

- An Availability Failure will occur if the provided compressed air pressure is below the minimum Availability Threshold or above the maximum Availability Threshold as identified in Table 5- Performance Parameters for Compressed Air System

**Table 5- Performance Parameters for Compressed Air System**

	<b>Availability Thresholds</b>	
	<b>Minimum</b>	<b>Maximum</b>
Compressed Air System	166.25 psi (175 psi - 5%)	183.75 psi (175 psi+5%)

## Appendix B - Summary of Reports

The following summarizes the reports and plans required by these IFM Specifications.

Note that other specific reporting requirements may exist however generally are included in a formal report as part of the list below.

This list is for convenience only and is not to be relied upon. The reporting requirements in the Technical Specifications should be consulted and shall be adhered to.

*Note that the term Service Report in the performance measurements includes all reporting requirements.*

### **Reports Submitted Monthly**

<b>Report Name</b>	<b>Description</b>
Maintenance Status Report	<p>PPC shall provide a report detailing the following:</p> <ul style="list-style-type: none"> <li>• Past month's performance on Demand Maintenance</li> <li>• Past month's performance on Scheduled Maintenance</li> <li>• Monthly Scheduled Maintenance activities for the upcoming month</li> </ul>
Operational Report	<p>PPC shall prepare on operations report with the following:</p> <ul style="list-style-type: none"> <li>• An executive summary</li> <li>• A summary of major activities and issues during the past month for each PPC service category as well as general responsibilities such as quality, risk management, OH&amp;S, Contractor procurement and management, etc.</li> <li>• A summary of all demand requests with statistics, graphs and analysis of trends and action to be taken based on the results</li> <li>• Human resources reporting including training, orientation, certificates, personnel and organizational changes, etc.</li> <li>• Statutory compliance</li> </ul>
Performance Monitoring Report	<p>The Performance Monitoring Report shall document all results and related failures along with the related deductions in accordance with Exhibit 4 (Payment Mechanism). A quarterly roll-up report shall be prepared to support invoicing and payment of the Quarterly Availability Payment.</p> <p>The Performance Monitoring Report shall also include a space trending report showing space temperatures during the period and identifying any rooms which have missed the required performance standards.</p>
Renewal Work Report	<p>PPC shall provide a report detailing the following:</p> <ul style="list-style-type: none"> <li>• Completed Renewal Work projects year-to-date</li> <li>• Renewal Work activities for the upcoming month</li> </ul>
System Availability Report	<p>PPC shall prepare a monthly report of the Performance Monitoring Program, comprised of a summary of all Service Failures and Availability Failures and the related performance details and applicable financial adjustment to the invoice in accordance with Exhibit 4 (Payment Schedule).</p>
Monthly Energy Report	<p>PPC shall prepare energy reports as required in Exhibit 12 (Energy Management)</p>

**Reports Submitted Annually**

<b>Report Name</b>	<b>Description</b>
Annual IFM Services Report	The Annual Summary report shall be provided by PPC to City no more than 20 Business Days following the completion of each Contract Year. This report shall be in a similar format to the monthly report however with an annual summary of results and information.
Annual Scheduled Maintenance and Renewal Work Schedule	PPC shall provide the Annual Scheduled Maintenance Schedule outlining major Scheduled Maintenance planned for the next Contract Year that may impact SFMTA O&M Services. PPC shall provide a planned Renewal Work schedule to the City annually on a date to be agreed with the City. This schedule shall include the proposed start and completion dates of each project.
Annual Service Plan	<p>PPC will develop the Annual Service Plan in accordance with the items listed below at a minimum. PPC may include additional information as appropriate.</p> <ul style="list-style-type: none"> <li>• A brief narrative overview or executive summary of PPC’s approach to delivery of IFM Services</li> <li>• The plan for delivery and provision of each of the IFM Services, including upcoming procurement activities, changes, audits, etc. along with potential impacts to City.</li> <li>• A detailed organizational and staffing plan for the upcoming Contract Year.</li> <li>• Activities or initiatives that may cause disruption to City or other users of the Facilities and the methods and/or accommodations PPC will implement to minimize such disruptions.</li> <li>• An analysis of past performance and upcoming changes to improve delivery of the IFM Services.</li> <li>• Recommendations for changes to any joint service protocols and procedures between PPC and City.</li> <li>• Any proposals for changes to IFM Services or the procedures that may impact SFMTA O&amp;M Services.</li> <li>• Subsequently the Annual Services Plan shall be reviewed and revised by PPC annually and re-submitted to City.</li> </ul>
IFM Services Procedures (revisions as necessary)	PPC shall develop IFM Services Procedures for the service areas to provide services in accordance with the relevant sections in Exhibit 18(Technical Requirements). These may be incorporated in PPC’s overall procedure documentation and may be standard procedures, however all unique City requirements are to be addressed.
Renewal Work Plan	<p>PPC shall:</p> <ul style="list-style-type: none"> <li>• Provide an initial 30-year Renewal Work Plan prior to Substantial Completion identifying the renewal projects planned in each Contract Year.</li> <li>• Provide a revised Renewal Work Plan to the end of the IFM Period annually as part of the Annual Service Plan, reflecting any changes to the planned projects.</li> </ul>

<b>Report Name</b>	<b>Description</b>
	<ul style="list-style-type: none"> <li>• Provide a summary of Renewal Work completed or in progress as part of the Annual Service Plan.</li> <li>• Provide a summary and status of completed, in progress, and upcoming work in the monthly management reports and meetings.</li> </ul>
Renewal Work Schedule	PPC shall: <ul style="list-style-type: none"> <li>• Provide Renewal Work schedule for each subsequent Contract Year at least 3 months prior to the commencement of the Contract Year.</li> <li>• The plans should identify the projects schedule for that Contract Year, the planned start and completion dates and potential impacts on SFMTA O&amp;M Services.</li> <li>• Where schedules have a potential impact on SFMTA O&amp;M Services, City may require PPC to change their schedule and/or provide a plan to demonstrate mitigation of impact of risk to SFMTA O&amp;M Services.</li> </ul>
Satisfaction Survey Report	PPC shall report results to City: <ul style="list-style-type: none"> <li>• Provide survey results and analysis within 30 days of the close of the survey for each occupant satisfaction survey or 30 days after each Quarter for the Transaction Survey</li> <li>• Provide an action plan within 45 days of the close of the survey</li> </ul>
Energy Analysis Report	PPC shall prepare energy reports as required in Exhibit 12 (Energy Management)

**Reports Submitted on an Ad-Hoc Basis**

<b>Report Name</b>	<b>Description</b>
Emergency Action Report	PPC shall provide an emergency action report following an Emergency that outlines the emergency, action taken and recommended mitigation to prevent future occurrences.
Performance Action Plans	Where the City (directly or through the PPC) observes a significant or consistent non-performance on any IFM Services, the PPC shall prepare a Performance Action Plan (“PAP”) upon request by the City. The PAP will be due five Business Days from the request of an alternate later date as identified by the City. The PAP submitted to City will, at a minimum, contain a summary of the issues raised by City, an analysis of the root causes of the issues, the steps that will be undertaken by PPC to address the issues and specific timeframes for such steps.
Report on permits, licenses and approvals associated with PPC work	The PPC shall provide an annual report on permits, licenses, and approvals associated with work conducted by PPC.

## Appendix C – Handback Residual Life Schedule

<b>Project Component</b>	<b>Residual Life</b>
Exterior Walls and Foundations	10 years
Roof membrane	5 years
Exterior Windows	10 years
Ceilings	10 years
Interior Walls and Partitions	10 years
Interior Windows	10 years
Domestic hot and cold water service	5 years
Chillers	10 years
Boilers	5 years
Cooling Towers	5 years
Air Handling Units	5 years
Low and medium voltage switchgear	10 years
Elevator cabs and panel boards	5 years
Vehicle Ramps	10 years
Flooring and parking surfaces	5 years
Compressed Air System	5 years
Fire Protection (fire pump, control panel, major sprinkler system components)	5 years
Heat Pumps, Chilled Beams, Large Fans > 1,000 CMF	5 years
Building Automation System	5 years
Standby Power System	10 years
Main Electrical Gear	10 years

## Appendix D – PPC Spaces

The following areas outlined from the Contract Drawings capture spaces that the PPC will have O&M and Lifecycle responsibility in accordance with these Technical Requirements:

Room Tag	Name	Floor	Department	O&M Responsibility	Lifecycle Responsibility
Unlabelled	LOBBY	Ground	09 - Shared	X	X
MEP020	MAIN ELECTRICAL ROOM	Ground	09 - Shared	X	X
MEP021	MECHANICAL ROOM	Ground	09 - Shared	X	X
MEP022	ELECTRICAL ROOM FOR CHARGERS	Ground	09 - Shared	X	X
01.1.02-65	FM SPARE PARTS STORAGE	Ground	FMO	X	X
09.1.08A	MAIN POINT OF ENTRY	Basement	09 - Shared	X	X
09.1.09	BICYCLE PARKING	Basement	09 - Shared	X	X

# Introduction

The San Francisco Municipal Transportation Agency (SFMTA) is committed to involving the people of San Francisco in the decisions that shape the city’s transportation system. This commitment is expressed in the agency’s [Strategic Plan](#) and through our ongoing investment in the Public Outreach Engagement Team Strategy (POETS). It is based on an understanding that:

- Those who are affected by government decisions should be informed and have an opportunity to participate in the decision-making process;
- The community’s trust in the public process directly affects our ability to deliver projects; and
- Most projects must meet legal requirements related to public notification and participation.

The agency’s approach to working with the communities we serve is reflected in our core values:

## RESPECT

We are courteous and constructive in our treatment of others. We recognize that our colleagues and their contributions are vital to the agency. We listen and directly engage our colleagues and the public to understand their needs and deliver effective services.

## INCLUSIVITY

We seek a variety of identities, abilities, and interaction styles to promote a diverse and fair workplace. We operate from the context of teamwork and positive intent. We serve the public and address historic inequities in transportation by including all communities in the agency’s decision-making processes.

## INTEGRITY

We are accountable for and take ownership of our actions. We are responsive and honor our commitments to our colleagues and stakeholders. We are transparent and honest in everything we do, from internal operations to external delivery.

To ensure consistent public communications and outreach across projects, the SFMTA established our Public Outreach and Engagement Team Strategy (POETS). The main components of POETS are:

**Requirements** for every project, **Resources** to support staff, **Relationships** with the community, and **Recognition** of outstanding work.

**This document presents the requirements for public outreach and engagement that every SFMTA project is expected to meet.** More information about the other components of the Public Outreach and Engagement Team Strategy, including supportive resources and recognition opportunities for staff, can be found on the POETS page located on the SFMTA intranet. The process of developing the SFMTA’s requirements and guidance involved extensive feedback from the community. It is strongly recommended that you review the summary of this valuable input in the [Appendix](#).

# Public Outreach and Engagement Requirements

To ensure a consistent approach throughout the agency, all managers and leads responsible for SFMTA projects that impact the public must ensure that their project teams do the following:

- **PLAN** for public outreach and engagement for the project
- **IMPLEMENT** the public outreach and engagement plan
- **DOCUMENT** the implementation of the plan and the feedback received

## Develop the Plan

Every SFMTA project must develop a Public Outreach and Engagement Plan at the outset of the project, and the project team must evaluate and revise the plan at each subsequent project phase. The plan should be reviewed within the division by the direct report manager and/or the POETS Division Lead. Each division is responsible for establishing a process to determine when a Public Outreach and Engagement Plan is considered complete and ready for submission to the POETS webpage. Whatever the protocol for deciding who submits the plan, the project manager/lead is ultimately accountable for ensuring that it occurs. **When the Public Outreach and Engagement Plan is considered complete according to the division's process, it must be uploaded to the POETS page on the SFMTA [intranet](#), where all Public Outreach and Engagement Plans are tracked. Keep in mind that every plan is a public document and may be reviewed at any time by SFMTA leadership and staff, city partners and members of the public.**

To help empower staff to meet these requirements, the agency provides a [Guide](#) and [Template](#) for creating a Public Outreach and Engagement Plan. These companion documents include guidance on doing a project needs assessment to identify stakeholders and impacts, writing a project brief, crafting key messages for target audiences, identifying the opportunities for public participation, selecting outreach and engagement techniques, establishing goals and measurable objectives, scheduling activities and tasks, evaluating the plan, and reporting back to the public.

At a minimum, every Public Outreach and Engagement Plan MUST include:

- Identification of who should be involved in developing the plan (staff, consultants, partners)
- Identification of project stakeholders, impacts, and decision space
- Early engagement of key stakeholders
- Use of multiple communication channels to reach audiences
- Compliance with language & accessibility requirements
- Consideration of the Racial Equity Action Plan and Toolkit
- Goals and measurable objectives for each phase of the project
- A method to document plan implementation and to collect data related to goals and objectives
- A strategy for outreach during all project phases, including detailed design and construction
- Sufficient budget to carry out the activities specified in the plan
- Coordination with other SFMTA projects that affect the project
- Coordination with other city partners who will be involved with the project

- A report submitted to the POETS webpage after each project phase

It is important to emphasize that the development of the Public Outreach and Engagement Plan should be a team effort. Those staff members who will be directly involved in the implementation of the plan should have input in the creation of the plan. Several aspects of the plan require careful consideration and judgement without hard and fast rules (e.g., stakeholder identification, impact analysis, budget). Involvement of key team members (including any consultants and partners) allows for a thoughtful and collaborative process and lays the groundwork for better understanding and successful implementation of the plan. In the case of projects with significant impacts on the community, it is also advisable to consult key stakeholders for their input as the plan is being developed (e.g., for advice on the most effective ways to keep particular communities informed).

Note that it is not mandatory to use the specific planning [Template](#) offered by POETS, but any Public Outreach and Engagement Plan must include comparable content regardless of the format, and any document used to satisfy these requirements must be uploaded to the POETS page on the SFMTA [intranet](#). The [Guide](#) and [Template](#) provide detailed instructions for the content of any Public Outreach and Engagement Plan.

## Programmatic Public Outreach and Engagement Plans

Every SFMTA project that impacts the public must implement its Public Outreach and Engagement Plan. Larger, more complex projects require their own detailed plans. In addition to large projects, the SFMTA routinely implements many smaller, similar projects (e.g., stop signs, signal changes) that can rely on a single, programmatic Public Outreach and Engagement Plan. Divisions that deliver such projects should develop programmatic outreach and engagement strategies that apply to typical projects in each category. Every small project must still consider community impacts, but the programmatic plan can be used as a template by each project. Only the programmatic plan that will serve as the template for projects in a given category must be uploaded to the POETS page on the SFMTA [intranet](#), not the plans for each project. However, every project that falls within a program category must have a plan based on the programmatic template. While project teams are not required to upload each plan to the POETS webpage, they are responsible for implementing the plan and can be held accountable. Project teams should also report to POETS Division Leads any lessons learned from individual projects that suggest changes needed to the programmatic plan template going forward.

### What is a “Project”?

For the purpose of these requirements, the SFMTA defines a project as, “A one-time effort to construct, acquire, replace, improve, expand, or rehabilitate the transportation system in the City and County of San Francisco.” The Public Outreach and Engagement Requirements apply to all capital projects, as well as one-time policy initiatives that are not capital in nature (including those that occur in multiple phases). Smaller, routine “projects” are sometimes classified as “operations.” Regardless of terminology, any action that impacts the public is subject to compliance with the Public Outreach and Engagement Requirements. As discussed below, there are specific guidelines for smaller, routine projects.

## Review the Public Outreach and Engagement Plan between Phases

The initial Public Outreach and Engagement Plan should describe the plan for public outreach and engagement for each phase of the project, with the assumption that the strategy for later phases will be adapted based on what is learned during implementation of earlier phases. The Public Outreach and Engagement Plan should be reviewed and updated at the end of each phase of the project. In cases where projects transition from SFMTA to another agency between phases, it is essential to coordinate with those city partners to maintain a consistent standard of outreach and engagement, even if the SFMTA is not the lead agency during a particular phase of the project. In order to achieve a successful transition for larger projects, POETS recommends funding for a Public Information Officer to work with the city partner(s) throughout the transition and until project completion.

There are good reasons to review the Public Outreach and Engagement Plan between phases. First, it gives the project team an opportunity to think about lessons learned at the completion of each phase and to incorporate those lessons into the next phase. Second, there is understandable uncertainty at the beginning of a project about the kind of public outreach and engagement that will be necessary during later phases (especially if the project will take years to complete).

## Internal Coordination

In planning for public outreach and engagement for a single project, it is important to know which other teams and projects within the SFMTA (including those in different divisions) might connect with, intersect or impact your project. Brief related staff and teams on your Public Outreach and Engagement Plan as early in the process as possible.

## Challenging Phases: Detailed Design and Construction

For projects that take years to complete, it is impossible to anticipate all aspects of outreach and engagement that will be needed to complete the project. The most challenging phases to include in the initial plan are detailed design and construction. While decision space is typically less during these phases (plans have been made, the project is legislated), it is essential to keep stakeholders informed and to continue to engage the community beyond the planning phase.

During the detailed design phase, it can feel to the community like the project is inactive. It is not uncommon for this phase to continue for several years, during which the community itself changes (there are new residents and merchants who never heard of the project and were not part of the planning phase). During the construction phase, project impacts are felt most acutely by the community and there may be new stakeholders affected who were not involved during project planning. Because these phases present unique challenges, the project team should closely review the original Public Outreach and Engagement Plan before detailed design and construction to create a more detailed and updated strategy. The [Appendix](#) provides examples of plans for the detailed design phase.

The City and County of San Francisco Construction Mitigation Program defines the measures that are required for construction mitigation for various kinds of projects (low, moderate and major impact). Construction Mitigation Plans should be created in advance of construction, developed in collaboration

with merchants and residents, and budgeted separately from the initial Public Outreach and Engagement Plan. The [Appendix](#) includes a summary of the program, along with a presentation and example plans.

## Submit the Plan

Every Plan must be uploaded to the POETS webpage upon completion and prior to implementation. The process of approving and submitting the plan is left to the discretion of each Division. Each division must determine its own protocol for deciding when a Plan is complete and ready to be submitted. Regardless of the division's process, project managers/leads are accountable for compliance at the project level.

## Implement the Plan

Once your Public Outreach and Engagement Plan is submitted to the POETS webpage, the project team is responsible for carrying it out. As noted above, the project manager/lead is ultimately accountable for implementation of the plan. The Public Outreach and Engagement [Guide](#) and [Template](#) provide advice and tools designed to help schedule and track activities. In addition, the SFMTA Public Outreach and Engagement Manager, the [POETS web page](#), Division Leads and [District Liaisons](#) can offer information and contacts to project teams as they implement their plans. The role of the POETS Division Leads is to ensure compliance with these requirements within each division and to provide support to project managers/leads and their teams, including referrals to appropriate resources. District Liaisons are designated staff members within the SFMTA who can provide geographically specific information and contacts to project teams.

## Compliance with Language Assistance Requirements

As a city department that receives federal funding, the SFMTA must follow both local rules (San Francisco's Language Access Ordinance) and federal rules (Title VI of the Civil Rights Act of 1964 and supporting guidance) regarding accessibility to our programs and services to ensure that all customers, regardless of their ability to read, speak, write and understand English ("limited-English proficient" or "LEP"), are informed and able to participate in our agency's decision-making processes. The SFMTA's 2016 Language Assistance Plan (LAP) details the agency's policies about providing both written (translations) and verbal (via interpreters or bilingual employees) language assistance for our limited-English proficient customers and other stakeholders.

The Language Assistance Plan includes maps detailing concentrations of limited-English proficient communities by language, which can be used as a resource when determining the language needs of those who are affected by the project. In general, and at a minimum, most public information pieces should be translated into Chinese, Spanish and Filipino (Tagalog), and all public communications and meeting notices must include the 311 "Free Language Assistance" tagline (included in the Public Outreach and Engagement Plan Guide). Public meeting and hearing notices and agendas, including those posted at SFMTA.com, must include the four-language 48 hours' notice and a staff person's phone number for requesting language assistance; LanguageLine telephonic interpretation services can be used to process requests from limited-English proficient customers via phone. The [Appendix](#) provides a LanguageLine

reference sheet and includes all language assistance taglines. Depending on content, transit related public information pieces might require additional translation support.

When considering language accessibility, the agency provides resources and training to assist with implementation. Guidelines and tips to providing language assistance can be found in the [Appendix](#). Specific language assistance questions and requests for individual consultation or staff training should be directed to SFMTA Regulatory Affairs Manager Kathleen Sakelaris at [Kathleen.Sakelaris@sfmta.com](mailto:Kathleen.Sakelaris@sfmta.com) or 415.701.4339.

## Planning for Equity

Regardless of the specific activities outlined in your Public Outreach and Engagement Plan, its implementation must be inclusive and equitable. The plan should include methods for soliciting feedback that engage and are accessible to those who have historically been underrepresented in the public process, including low-income households, people of color, youth, seniors, and people with disabilities.

The core principle that informs the practice of public outreach and engagement is that those who are affected or have been historically disenfranchised by government decisions have a right to be included in the decision-making process.

The SFMTA has worked with the Local and Regional Government Alliance on Race and Equity (GARE) to develop a Racial Equity Action Plan and Toolkit that promotes diversity and inclusion internally and with the communities we serve. This signals the agency's intention both to apply a racial equity lens to project-level planning and implementation, and to build the organization's capacity and skills to achieve greater equity as an overall outcome of our work.

While it may be more difficult and require more resources to reach and engage members of underrepresented communities, it is essential to make a deliberate effort to do so. Equity should be a primary consideration in establishing goals and objectives for the plan, and project teams should measure success with appropriate data. Teams should also seek to partner with stakeholders in developing and implementing the plan in order to achieve results that are meaningful to the community.

## Required Notification

When implementing any plan, the legal minimum distance for notification about the project should be treated as a starting point. In some cases, those neighborhoods and stakeholders who are affected by the project will extend beyond the minimum required distance, warranting broader notification. All Public Outreach and Engagement Plans — including programmatic plans for smaller projects — require an assessment of the project's impacts. The expectation is that every project team will plan for notification based on a thoughtful consideration of the anticipated impacts of the project and those community members who will actually be affected.

## Online Presence

Every SFMTA project is required to have an online presence, either a page on the agency website or an equally accessible and comparable alternative. At a minimum, the information posted online should include a project description, project history and current phase, opportunities for public input, and contact information for the project manager/lead and anyone else who is responsible for answering

questions about the project. If the website is designed to receive written questions or comments, it must be monitored regularly so that staff can reply in a timely manner if a response is appropriate.

## SFMTA Calendar

Every public meeting associated with the project must be posted on the SFMTA master [calendar](#) at least as early as the meeting is announced through other channels.

## Document the Plan

Project teams must track key indicators related to outreach and engagement by documenting:

- How the Public Outreach and Engagement Plan was implemented (and any changes in implementation from the original plan)
- Any input received from the public
- How public input influenced the project (and the reasons why or why not)
- How public input was presented to decision makers
- The indicators established for the plan's goals and objectives

At the end of each project phase the team must complete a brief summary of lessons learned and recommendations for the next project phase. When you complete this brief report ("Plan Evaluation" on page 11 of the [Template](#)), submit an updated version of your plan (including answers to the evaluation questions and any revisions to the plan itself) to the [POETS web page](#). Add a date to the file name to distinguish it from previous versions.

## Close the Feedback Loop

From the community standpoint, documentation of public input is essential to closing the "feedback loop." If the plan calls for public consultation, the stakeholders who participate should know how their input was conveyed to decision makers and whether it had any influence on the outcome. This can only happen if the project team documents public input and the process by which they took it into account. For this reason, the Public Outreach and Engagement Plan should always include a plan to report back to stakeholders at the end of each project phase.

From an internal perspective, planning for public outreach and engagement is an ongoing process, and each project team is expected to review and revise previous plans as the project moves through each phase. To make informed decisions, the team needs to know what was learned from public participation in earlier phases. Documentation at the project level also supports an accumulation of lessons throughout the agency that can inform future practice on other projects. It also provides elected and appointed officials with essential information to inform their decision-making.

# Accountability

All SFMTA projects that impact the public are subject to the Public Outreach and Engagement Requirements. Project managers are accountable for meeting the requirements, and failure to adequately plan for and implement public outreach and engagement can jeopardize project funding and delivery at any phase.

A [General Notice](#) from the Project Management Office specifies procedures to ensure compliance with these requirements. It states that the needs assessment should be conducted at project inception, and the expected cost of outreach and engagement should be included in the original project budget. The Public Outreach and Engagement Plan must be integrated into the project's pre-development report, ensuring that it will be completed no later than the end of the planning phase.

Throughout all phases of the project, there are multiple opportunities for review of the Public Outreach and Engagement Plan. These include:

- Review of funding requests for planning and preliminary engineering through the Project Integration Committee and the Transportation Capital Committee;
- Review of phase milestones by the Project Management Office before approval of funding for subsequent project phases;
- Review of project implementation by the Project Delivery Technical Advisory Committee;
- Interdepartmental reviews of proposed street changes by the Transportation Advisory Staff Committee (TASC) and related internal reviews by the Pre-TASC Engineering public hearings;
- Development of a Construction Mitigation Plan, which is explicitly required to comply with the Public Outreach and Engagement Requirements.

In addition to these structured opportunities for review, every plan is subject to random audit by agency leadership. The POETS team is available to provide support in developing strategies and budgets for outreach and engagement to ensure that projects comply with the requirements.

# Conclusion

These requirements are meant to hold the SFMTA to a high standard of practice for public outreach and engagement. At the same time, the POETS program is designed to give staff members the support they need to meet the requirements. The Public Outreach and Engagement Plan [Guide](#) and Public Outreach and Engagement Plan [Template](#), companion documents to these requirements, provide a blueprint for how to develop, implement and document an appropriate strategy for each project. In addition, the POETS team and Division Leads are available to offer guidance on an ongoing basis as project teams create and revise their plans. As part of that support, the POETS webpage includes a wealth of resources and training opportunities available to staff members who work with the public.

The purpose of the Public Outreach and Engagement Requirements is to ensure that those who are affected by the SFMTA's decisions and actions are included in the decision-making process, and that the

interests of the community are carefully considered as the agency carries out its mission of maintaining and improving San Francisco's transportation system. A related goal of these requirements is to give every SFMTA project the best possible chance to be delivered smoothly, anticipating challenges and avoiding extreme course corrections. Thoughtful planning is the key, and the needs and concerns of the community must be an integral part of that process. In the end, the POETS approach of establishing high standards and providing the necessary support to meet them is intended to strengthen the position of staff who are responsible for working with the public. By taking the time up front to plan for meaningful public outreach and engagement, project teams are more likely to have a positive experience in the community and will be more confident and better prepared to deliver their projects with outstanding results.

# Introduction

The San Francisco Municipal Transportation Agency (SFMTA) moves nearly a quarter million people daily within the city of San Francisco. To fulfill the agency's mission to "connect San Francisco through a safe, equitable, and sustainable transportation system" the agency undertakes more than 200 projects at any given time, including major transit corridor investments, safer designs for local streets, and improvements to all modes of transportation throughout the city.

As the transportation agency for the City and County of San Francisco, the SFMTA has a responsibility to keep the public informed as part of our work. The agency is committed to fulfilling these responsibilities and going above and beyond to engage the public in our work. We are committed to strengthening and sustaining our relationships with the community and to ensuring that the agency delivers quality transportation projects to those who need them. This commitment is expressed in the SFMTA's [Strategic Plan](#) and through our ongoing investment in the Public Outreach and Engagement Team Strategy (POETS).

The purpose of this document is to guide those staff members who conduct public outreach and engagement and clarify the agency's expectations for what must be included as part of the public outreach and engagement planning process. This guide is a companion to the [Public Outreach and Engagement Plan Template](#), which project teams can use to develop a plan that meets our agency's requirements for conducting public outreach and engagement. The [Public Outreach and Engagement Requirements](#) outline what is expected to occur as part of agency outreach to the public on any given project.

The first section of this document provides instructions for using the fillable Template to create a Public Outreach and Engagement Plan. The second section presents general principles, practices and tips to consider when developing a plan. The final section summarizes the "Spectrum of Public Participation," a helpful framework for thinking about your plan's purpose and goals.

The process of developing the SFMTA's requirements and guidance involved extensive feedback from the community. The agency heard from a range of diverse voices – those who both benefit from our work and are impacted by our projects. A summary of this valuable community input is included in the [Appendix](#).

# Guide to Public Outreach and Engagement Planning

This section provides a step-by-step guide to develop a project-level Public Outreach and Engagement Plan in accordance with the agency's [Public Outreach and Engagement Requirements](#). Each heading below corresponds to the [Public Outreach and Engagement Plan Template](#), which provides a format for writing a project-level plan. This section supplements the instructions in the Template.

**When a project's Public Outreach and Engagement Plan is complete, it is mandatory to submit it to the POETS webpage on the SFMTA intranet [here](#). Note that each division determines its own process for deciding when a plan is ready to be uploaded and who is responsible for doing so. Keep in mind that the Public Outreach and Engagement Plan is a public document and may be reviewed by SFMTA leadership and staff, city partners and members of the public.**

## Project Overview

The purpose of the Project Overview is to summarize the project scope, purpose, benefits and timeline. It also includes some early considerations about decision space – constraints and decisions that have already been made, and decisions that are yet to be made. When preparing this information, take into consideration that the overview may be used for the project webpage, fliers, etc. Note that the next step (Project Needs Assessment) adds valuable information – project impacts, stakeholders, opportunities for public input – that can be added later to the basic information in the Project Overview.

## Project Needs Assessment

A Project Needs Assessment is critical to the planning process. It is your chance to think carefully about those who will be affected by the project, the purpose of your outreach and engagement strategy, and the relationships that will matter most for the success of the project.

The Project Needs Assessment should help to identify three things: stakeholders, impacts and decision space. Note that while the Template presents the identification of these as sequential steps, they are in

Public participation is based on the belief that those who are affected by a decision have a right to be involved in the decision-making process.

- IAP2 Core Value

fact interdependent, and the assessment should be more iterative than linear. As you complete the following steps, consider how each of the components informs the others. For example, understanding what decisions the public can influence might affect the potential impacts and identification of stakeholders.

Within the Project Needs Assessment, the **stakeholder analysis** identifies those audiences that need to be informed and/or engaged. It also suggests a method of gauging the level of outreach that is required. Research on stakeholders should clarify their roles, the degree to which they are organized, their capacity to participate, and specific considerations for ensuring an inclusive and culturally appropriate public process (language, accessibility, barriers to participation, etc.). The Template helps to

identify which key stakeholders should be contacted early on, to make them aware that the project team will be reaching out to the community. Valuable internal resources to help gather the information for the stakeholder analysis include the Public Outreach and Engagement Team, District Liaisons, POETS Division Leads, and the Regulatory Affairs Manager (for help with language access).

The **impact and interest analysis** in the Project Needs Assessment suggests how extensive the outreach and engagement effort should be, and the level of resources that will be needed to carry it out. The table in the Template is designed to be a starting point for discussion among members of the project team. Once you answer the ten questions about anticipated impacts and the level of public interest in your project, you will end up with an average score on a scale of very low to very high. While there is no hard and fast rule about how to interpret this number, a higher score generally suggests that more effort and resources will be needed for community outreach. Answering the diagnostic questions as a team (including the project manager, communications lead, relevant consultants and any staff members who will be doing outreach and engagement) will give you the best chance possible to accurately gauge the public's response to your project.

The **decision space analysis** in the Project Needs Assessment identifies the opportunities for stakeholders to provide input and potentially influence the project. Decision space is normally limited by a variety of constraints: agency goals, direction from policymakers, previous decisions, legal requirements, technical feasibility, available budget, etc. Within these constraints, it is always important to consider whether the decision space can be expanded beyond simply telling the public what is going to happen. Even during construction, when decision space is typically most limited, there might be room to consider input on timing, sequencing or mitigation to address community concerns. One reason for seeking to expand the decision space is to demonstrate the agency's commitment to listen to the public. Another is that community members often have good ideas that can strengthen the project and help you deliver it successfully.

The analysis of impacts and interests is closely connected to decision space. In general, greater impacts and higher levels of concern will raise expectations and put pressure on the project team to give the public a say in shaping the project. It is much easier to suggest that the purpose of outreach is only to inform the public when there are few negative impacts and minimal interest in the project. Therefore, given the constraints that limit decision space, there is a tendency for a higher score on the impact and interest analysis to be associated with a higher level of engagement on the spectrum of public participation described below. In other words, the project impacts and level of public concern are not the only factors that determine decision space, but they are critical to consider in the analysis.

## Goals and Objectives

The Project Needs Assessment provides the information needed to establish goals and objectives for the Public Outreach and Engagement Plan. This can be the most difficult task in developing the Public Outreach and Engagement Plan, for at least two reasons. First, it only makes sense to establish goals and objectives if they can be measured. This means that metrics need to be realistic, so that information and data can be gathered to evaluate the success of the plan. Second, it is important to have goals and objectives that are meaningful. The key metrics should measure not only the activities of outreach and engagement (How many people did we reach? How many people attended our meetings?) but also measure the results that matter (How did public input affect the final project? Did our outreach and engagement provide helpful input to decision makers?).

This section provides a brief guide to setting goals and objectives for a Public Outreach and Engagement Plan. The approach is to (1) Keep in mind the agency's goals for working with the public, (2) Establish project goals that correspond to the "levels of participation" on the IAP2 Spectrum, and (3) Establish project objectives that can be realistically measured and related to the project goals.

Every Public Outreach and Engagement Plan should consider the broader agency goals for communication and public participation as expressed in the SFMTA's [Strategic Plan](#) and [Public Participation Plan](#). Keep this agency-wide context in mind as you develop project-level goals and objectives.

Strategic Plan Goal 4.0, Objective 4.3 commits the agency to enhance customer service, public outreach, and engagement: "Effective communications and consistent messaging can create meaningful opportunities for community input, give policymakers the information they need to support their communities, and improve the agency's projects and service delivery. Not only is community engagement critical in developing near-term projects that serve the community, it can also benefit long-term, comprehensive efforts related to safety, transit service, and mode choice. Placing this objective in Goal 4 underscores the agency's commitment to not only improve agency communications and engagement processes, but to also overhaul the agency's internal communications processes to better serve the public and agency staff."

The SFMTA [Public Participation Plan](#) emphasizes the agency's commitment to inclusion, equity and accessibility. Planning for every SFMTA project should meet these expectations. In practice, this means that project teams should consciously address barriers to participation and should make deliberate efforts to reach out to communities that have been historically underrepresented in the public process.

The **goals** of public outreach and engagement for a specific project should correspond to the four levels of public participation on the IAP2 Spectrum: Inform, Consult, Involve or Collaborate. The identification of goals comes directly from the Decision Space analysis in the Project Needs Assessment. Every Public Outreach and Engagement Plan should have the goal to **inform** the public about the project. In addition to informing, most projects will also have an opportunity for the public to provide input that might influence the project. Therefore, most projects will also **consult** to some extent as a goal of the project, with the parameters for potential public influence (the Decision Space) clearly defined. Some projects will also present further opportunities for public partnership and influence, meaning that the goals for public participation might be to **involve** the community or to **collaborate** with stakeholders.

"Reach out and listen to people, don't just 'educate' them."

- Stakeholder Feedback

The **objectives** of public outreach and engagement for a specific project should be meaningful and measurable. Objectives should have a meaningful relationship to the goals of the Public Outreach and Engagement Plan (How do we know that the public was informed or consulted? What did we hear that would be helpful to decision makers?). Objectives should also be measurable. Measures can be quantitative (How many people did we reach through various communications channels?) or qualitative (How did the project change as a result of public input?). The key is to create objectives that are linked to the goals for the plan, and that can be documented and communicated to decision makers and the public.

Some examples of Objectives that could correspond to Goals:

- Number of those reached through communications channels and attending meetings
- Number of users accessing the project webpage; number providing online feedback
- Percentage of stakeholders surveyed at meetings who feel informed about the project
- Specific ways that public input influenced the project (a “We Listened” category)

## Key Messages

Design your key messages about the project for both general and specific audiences, building on the Project Overview. Keep in mind that the most important consideration is the desired impact of the communication effort within the overall Public Outreach and Engagement Plan. For every project, the goal of communication is to inform the community about the project, its benefits, its impacts, and opportunities for formal public comment. Plans that also call for consulting or involving the community during project planning will require additional information and communication to support an engagement strategy. Successful messaging is not just about content, but also the impact of communication. In all cases, it is important to be consistent and transparent in messaging – providing the community with a clear path to information and staff contacts – in order to build trust throughout the life of the project.

For almost any project, key messages include:

- Purpose and benefits of the project
- Anticipated impacts of the project
- Project timeline and current phase
- Opportunities for public participation
- Project contacts (who and how to reach them)
- Project webpage (how to access further information online)
- Specific messages for specific audiences

In general, key messages should be concise (a few short statements that are easily understood), relevant (limit information to what is essential), compelling (lead with benefits and highlight opportunities for public input) and tailored to the audience (with special consideration of language needs). Use plain language and avoid jargon and acronyms. It is always advisable to check your messages with representatives of the audiences you are trying to reach.

## Outreach and Engagement Techniques

The selection of outreach and engagement techniques should be based on the Project Needs Assessment and the project goals and objectives. When the goal is to inform, the techniques used should be tailored to specific audiences. When the goal is to invite feedback from stakeholders, the plan should include techniques and tools designed to gather and compile public input, and it should be specific about the kind of feedback that could affect the project.

The field of practice offers a wide variety of techniques and tools to choose from. The key is to think carefully about the intended purpose of public participation at each phase of the project, and to select

techniques, tools and meeting designs that fit the project goals while getting information to stakeholders in the way they prefer to receive it. Regardless of other considerations, our stakeholders report that all flyers and posters should use large print and plain language, and they should be placed in multiple locations and at various heights. In addition, all electronic communication should be reviewed for accessibility.

The [Appendix](#) provides several resources to help you think about techniques: (a) a summary of communication techniques that are commonly used for SFMTA projects, (b) a description of various outreach techniques, engagement strategies and meeting formats that correspond to different goals on the public participation spectrum, and (c) guidance for making meetings accessible.

## Schedule and Responsibilities

Once the goals for public outreach and engagement have been determined and the methods have been selected, the next step in developing the Public Outreach and Engagement Plan is to create a schedule of activities and assign responsibility for implementation tasks.

The schedule should be detailed enough to be useful to the project team, but also appropriate as a tool to report to stakeholders, agency partners and decision makers. It should include the timing of specific communications efforts, outreach to key stakeholders, and key meetings or events. It should also note those activities that are ongoing throughout the duration of the plan, as distinct from communications for a specific meeting or event.

Project teams may use their own formats (or those provided by consultants) to track detailed tasks, individuals responsible, and due dates. The format for your project's outreach and engagement strategy can be a single spreadsheet, or a combination of tables for different tasks. The format is less important than the content: When do activities need to happen and who is responsible for carrying them out? When planning public meetings, the action plan should highlight dates for inviting participants, arranging meeting logistics, producing meeting materials, recruiting facilitators, etc. One approach is to create a summary timeline and a separate, more detailed production schedule for individual tasks.

## Budget

The budget for Public Outreach and Engagement can be estimated based on the size and scope of the project, as well as the extent of activities in the Public Outreach and Engagement Plan. Costs can vary widely based on staff time, communications collateral, language support, online engagement, and the number of public meetings held.

As noted above, it might be necessary to estimate the budget for public outreach and engagement before the plan is fully developed. To ensure adequate resources are devoted to outreach and engagement (including for language translation and interpretation), it is critical to conduct a Project Needs Assessment as early as possible. If your project requires a budget estimate before the Public Outreach and Engagement Plan is complete, the POETS team or your POETS Division Lead can provide guidance.

## Plan Review

Once the Public Outreach and Engagement Plan has been drafted, it is important to review it within the SFMTA before moving to implementation. As a practical matter, the plan should be developed in concert with all of the team members responsible for carrying it out (including staff and consultants), and ideally in consultation with key stakeholders. As noted at the outset of this Guide, one of the first steps in developing the Public Outreach and Engagement Plan should be to identify all of those individuals and groups who should be part of the conversation before the plan is developed and approved.

Any project that will transition from the SFMTA to another city agency (e.g., between legislative approval and construction) must address this transition in its Public Outreach and Engagement Plan. As early as possible, the project lead should meet with city partners to establish roles and budget responsibilities.

The project lead should meet with the District Liaison for the project area to be aware of any other SFMTA projects that might affect your project. If there are intersecting projects, the outreach and engagement activities for both should be coordinated to the extent feasible.

It is always a good idea to review the draft plan with an experienced colleague. Consider reaching out to your POETS Division Lead, a public information officer, or the POETS team if you have questions or challenges while completing your plan.

Once the Public Outreach and Engagement Plan is reviewed internally and with city partners, it must be approved by the project manager and then uploaded to the POETS webpage. At the end of each project phase, the evaluation section of the plan should be filled out and submitted to the same link.

Prior to implementation, the project lead should provide a summary of the project and the Public Outreach and Engagement Plan to the SFMTA's Media Relations Manager and should consider whether to reach out to elected officials (District Supervisors' Aides, State delegation offices).

## Plan Evaluation

The Public Outreach and Engagement Plan should be viewed as a living document. Adaptation to changing or unforeseen circumstances is a basic principle of good public engagement. The implementation of the Public Outreach and Engagement Plan should be carefully documented, with records kept on who was contacted and who participated in any meetings held. Ideally, any meeting other than a public hearing should include a feedback form from participants. The [Appendix](#) has an example of a meeting evaluation survey. At a minimum, the project outreach and engagement lead should submit a brief report at the end of each phase of the project. The plan should be reviewed and updated every six months if the project phase lasts longer than this.

Review of the Public Outreach and Engagement Plan should include answers to the following questions outlined in the [Public Outreach and Engagement Plan Template](#):

- Was the Public Outreach and Engagement Plan implemented as planned?
- If there were changes in practice from the original plan, please explain.
- How did the plan perform on its identified goals and objectives?
- What were the key lessons learned during implementation?

- What changes would you recommend to the plan going forward?
- How did you document public input and take it into account?

## Report Back to Stakeholders

After evaluating the Public Outreach and Engagement Plan, the project team should also report back to stakeholders (including partners and decision makers) at the end of each project phase. What was the purpose of outreach and engagement at this phase of the project? Who was contacted and/or engaged in the public process? What feedback did the public provide? If applicable, how did the project team take public input into account? How was it conveyed to decision makers and how did it affect the project?

The project brief created at the beginning of the Public Outreach and Engagement Plan, along with the evaluation conducted at the end of the plan, provides the information needed to complete this report back to the community at the end of each project phase. All stakeholders engaged in the process should receive this summary report, which completes the “feedback loop” described in the Public Outreach and Engagement Requirements.

# Tips for Developing a Public Outreach and Engagement Plan

The SFMTA established our Public Outreach and Engagement Requirements to ensure that project teams are thoughtful in their approach to working with the communities we serve. This section offers general guidance to help you think about your Public Outreach and Engagement Plan. These tips do not correspond directly to the planning steps outlined in the Template. Instead, they emphasize that the development of your plan is not a mechanical process, but is instead an iterative and reflective effort.

## Tip 1: Determine the Kind of Plan the Project Requires

The SFMTA’s Public Outreach and Engagement Requirements mandate that every SFMTA project must have a Public Outreach and Engagement Plan. For the purpose of this requirement, a “project” is defined as, “A one-time effort to construct, acquire, replace, improve, expand, or rehabilitate the transportation system in the City and County of San Francisco.” The assumption is that “one-time” includes projects that occur in multiple phases. In cases where the distinction between a “project” and “operations” is not clear, the key question is whether the agency’s action impacts the public. If there are community impacts from an action, then the agency should plan for some level of public outreach and/or engagement.

If a project needs a plan, the first question to address is whether the project team needs to create a new, customized Public Outreach and Engagement Plan, or whether this is a smaller, routine project that can use a template developed within each Division. POETS refers to the latter as a **Programmatic Public Outreach and Engagement Plan**. The kinds of projects that are appropriate for Programmatic Plans are determined by each Division, and each Division is responsible for developing a Programmatic Plan for each category of projects. Examples might include stop signs or signal adjustments. Every small project must still consider community impacts, but the Programmatic Plan can be used as a template for each project that falls within the program category. The Programmatic Plan should be on file with POETS, and if so,

individual projects in the program category do not need to file separate plans (e.g., there's one Programmatic Plan on file for stop sign changes, so it's not necessary to file a separate plan for every stop sign change).

In addition to determining the kind of plan your project requires, it is essential to determine WHO needs to be involved in the development of the plan. Planning for outreach and engagement is not a solitary exercise in the office, but instead should involve collaboration among a team of staff members (and any consulting members of the team), informed by conversations with SFMTA colleagues, key community stakeholders, partner agencies, and decision makers. Given all the information and judgements that are necessary to create a Public Outreach and Engagement Plan, one of the first steps in planning is to identify who should be part of the process.

### Tip 2: Scale the Plan to Fit the Project

The Public Outreach and Engagement Plan should be appropriate to the scale of the project. Plans for large projects will be detailed and complex, while those for smaller, simpler projects can be more standardized, as described above. The templates are designed to be helpful for all projects regardless of their size, and they are intended to be flexible. If the Project Needs Assessment determines that project impacts are minimal or that there is no opportunity for public influence, then the purpose of the plan might only be to inform stakeholders. On the other hand, even the simplest project might offer some opportunity for public influence.

### Tip 3: Begin Outreach and Engagement as Early as Necessary

Planning for outreach and engagement should always begin as early as possible, ideally at the conceptual or pre-planning phase of a project. This does not necessarily mean that public outreach should be the first step in project implementation, only that an early Project Needs Assessment should identify WHEN is the best time to begin outreach and engagement with the public. In general, opportunities for the public to provide input on a project are greater during the early stages of a project (versus during post-legislation or construction). However, it can be counterproductive to reach out to the public too early, before relevant questions are addressed in the Project Needs Assessment (scope of the project, decision space, etc.). You get one chance to make a first impression, so it is critical to be prepared before going to the community. The point is to begin planning for public outreach and engagement at the outset of the project, and to include early outreach to key stakeholders in the plan whenever appropriate.

From the stakeholder's standpoint, "early" generally means before key decisions have been made, and in time for the public to have meaningful input on the project to the extent possible.

Realistic planning for outreach and engagement also includes early consideration of funding. As a practical matter, the Project Needs Assessment must be done soon enough to estimate the budget for outreach and engagement before the plan is fully developed. The POETS team can help with budget estimates.

## Tip 4: Coordinate with Other SFMTA Projects and City Partners

The Project Needs Assessment identifies stakeholders, including those who will work on the project within the SFMTA and the city of San Francisco. When planning for public outreach and engagement for your project, it is important to know which other teams within the SFMTA might be working in the same geographic area. Project teams working in the same community should connect with one another as early as possible to share information, formulate communications strategies, and coordinate activities in a way that facilitates community understanding and input opportunities for intersecting projects.

“Nobody cares if it’s MTA or PUC or DPW. To us, it’s the city.”

- Stakeholder Feedback

It is also essential to think forward about all phases of the project during initial planning. It is common for a project to be handled by different SFMTA divisions at different phases, or for a project to be handed off by the SFMTA to another agency (e.g., Public Works, Public Utilities Commission) at some phase. In either case, it is essential to coordinate with those agency and city partners to maintain a consistent standard of outreach and engagement, even if the SFMTA is not the lead during a particular phase of the project. From the community point of view, it doesn’t matter which agency is working on a particular phase of a project. If it was seen as an SFMTA project from the beginning, then the SFMTA will be held responsible for how the project is carried out.

## Tip 5: Comply with Language Access Requirements

As a city department that receives federal funding, the SFMTA must follow both local rules (San Francisco’s Language Access Ordinance) and federal rules (Title VI of the Civil Rights Act of 1964 and supporting guidance) regarding accessibility to our programs and services to ensure that all customers, regardless of their ability to read, speak, write and understand English (“limited-English proficient” or “LEP”), are informed and able to participate in our agency’s decision-making processes. The SFMTA’s 2016 Language Assistance Plan (LAP) details the agency’s policies about providing both written (translations) and verbal (via interpreters or bilingual employees) language assistance for our limited-English proficient customers and other stakeholders.

The Language Assistance Plan includes maps detailing concentrations of limited-English proficient communities by language, which can be used as a resource when determining the language needs of those who are affected by the project. In general, and at a minimum, most public information pieces should be translated into Chinese, Spanish and Filipino (Tagalog), and all public communications and meeting notices must include the 311 “Free Language Assistance” tagline (included in the Public Outreach and Engagement Plan Guide). Public meeting and hearing notices and agendas, including those posted at SFMTA.com, must include the four-language 48 hours’ notice and a staff member’s phone number to request language assistance; LanguageLine telephonic interpretation services can be used to process requests from limited-English proficient customers via phone. The [Appendix](#) includes a LanguageLine reference sheet, all language assistance taglines, and tips for providing language assistance. Depending on content, transit related public information pieces might require additional translation support.

The agency provides resources and training to assist with language assistance. Specific questions and requests for individual consultation or staff training should be directed to SFMTA Regulatory Affairs Manager Kathleen Sakelaris at [Kathleen.Sakelaris@sfmta.com](mailto:Kathleen.Sakelaris@sfmta.com) or 415.701.4339.

## Tip 6: Make Outreach and Engagement Accessible and Equitable

All activities outlined in the Public Outreach and Engagement Plan must be implemented in a way that is inclusive and equitable. Activities should include methods for soliciting feedback that meet communities on their own terms, and that are accessible to youth, seniors, people with disabilities, and underrepresented community members, regardless of ability. The goal of the SFMTA is to inform anyone affected by our projects about their benefits and impacts, and to include anyone in the public process who has an interest in participating. The purpose of making communications and meetings accessible is not to “check a box,” but to ensure that opportunities for public participation are open to all.

All communication materials should be provided in accessible formats. As noted above, the [Appendix](#) provides guidance on making meetings accessible. For assistance on making your materials and meetings accessible, contact [Annette.Williams@sfmta.com](mailto:Annette.Williams@sfmta.com) or 415.701.4444.

The [Muni Service Equity Strategy](#) takes a neighborhood-based approach to address disparities on transit routes that are most critical to people from low-income households and people of color. As of 2018, there are eight neighborhoods covered by the Equity Strategy: Bayview, Chinatown, Mission, Tenderloin/SOMA, Oceanview, Outer Mission/Excelsior, Visitacion Valley, and Western Addition. Project teams working in any of the neighborhoods named in the Equity Strategy should review the documents at the link above and think carefully about how to apply the strategy to their own projects.

Regardless of whether your project falls within these eight neighborhoods, your Public Outreach and Engagement Plan should have a strategy to include those community members who have historically been underrepresented in the planning and decision-making process. While it may be more difficult and require more resources to reach and engage members of these communities, it is essential to make a deliberate effort to do so. The agency offers resources and support to help you plan for inclusive, equitable and accessible outreach and engagement.

**“Public Participation”** refers to the role of community members in planning and decision-making processes. It involves a two-way relationship in which the agency consults the public.

**“Outreach”** refers to agency efforts to inform stakeholders about the project and opportunities to participate in the public process.

**“Engagement”** refers to the agency’s strategy to encourage public participation and consider public input.

## Tip 7: Be Thoughtful about Stakeholder Notification

The goal of outreach and engagement is to be inclusive and equitable. Consider the full range of stakeholders who might be impacted by, or interested in, the project. As a general rule, it is advisable to expand rather than limit the geographic scope of project notification and updates, and to consider non-geographically defined communities that might also have an interest in the project. In cases where notification is legally required within a specified distance, consider doing outreach beyond the minimum legal requirement if indicated by the Project Needs Assessment.

One of the most consistent messages we have heard from community members is that notification should not be limited to the immediate neighborhood in which a project is taking place. Residents and other stakeholders in surrounding neighborhoods can be affected in sometimes unanticipated ways, so it is always advisable to err on the side of doing wider notification and outreach.

### Tip 8: Plan for Outreach during Detailed Design and Construction

It is critical to maintain ongoing communication across all phases of the project, including those periods when there are no public meetings or legally required notices. Most large projects face a period between legislation and construction when the project has been approved but construction has not yet begun. Often, this phase can take years and can result in the community not knowing or understanding that the project has been even been approved, let alone that it is going to be implemented after a period of inactivity. In such cases, when construction begins, community members can be caught unaware. The approval process may be a distant memory for those who were involved, and newer residents may feel alarmed that they did not have an opportunity to participate during the early project phases.

For this reason, the Public Outreach and Engagement Plan must include a strategy to keep the public informed during these “quiet” or “inactive” periods. Examples of plans specifically tailored to the detailed design phase of a project can be found in the [Appendix](#).

### Tip 9: Consider Opportunities to Expand Engagement

There is always an obligation to inform the public about a given project. But despite the temptation to think our work ends here, it is rare that our only obligation is to inform through one-way communication. In almost every case, there is also an opportunity to engage stakeholders more deeply on some aspect of the project and to consider how public input might affect the project. Even during construction, there might be choices about sequencing, scheduling or mitigation that stakeholders can influence. While the minimum goal is always to inform the public about a project, good practice requires thinking carefully about how the “decision space” for public influence can be defined and potentially expanded at each phase of the project’s delivery. The next section on the “Spectrum of Public Participation” provides a framework for thinking about decision space.

### Tip 10: Update the Plan between Project Phases

The Public Outreach and Engagement Plan should lay out a strategy for the life of the project, with the understanding that the plan will be reviewed and updated at the end of each phase based on lessons learned and changing conditions. As a general rule, it is advisable to update the Public Outreach and Engagement Plan approximately every six months, even if a project phase lasts longer.

The Public Outreach and Engagement Requirements call for documentation of the how the Public Outreach and Engagement Plan was implemented. The templates for creating the Public Outreach and Engagement Plan provide space to record whether the plan was implemented as expected during a particular phase, the lessons learned, and the recommended revisions to the plan going forward.

## The Spectrum of Public Participation

A key step in developing the Public Outreach and Engagement Plan is identifying the purpose of public participation at each phase of the project. Is the purpose simply to inform stakeholders, or is it also to ask for public feedback that might shape the project? Public participation practitioners refer to this as the project's **Decision Space**. To what extent can the public influence the project? What has already been decided, and what is on the table for consideration? The SFMTA makes a commitment about how public participation can influence each of our projects. Defining the "decision space" gives the community clear expectations about the purpose of public participation and helps planners understand how public input that can potentially influence the project.

The SFMTA has worked closely with the International Association of Public Participation (IAP2), whose **Spectrum of Public Participation** is a useful framework for helping to think about the decision space for a project. The Spectrum defines the project sponsor's commitment to public participation during each phase of project delivery. Once the goal of public participation has been defined, the Spectrum helps the project team choose the outreach and engagement methods that are appropriate for the project. The agency can reach out to stakeholders just to inform them about a project, or also to engage them in higher levels of participation along the Spectrum. Any level of public participation beyond "inform" requires some level of "engagement" by the agency in addition to communications "outreach."

The figure below defines four levels of public participation on the IAP2 Spectrum and suggests methods that correspond to each level. It is important to note that the correspondence between the level of participation and the methods used is suggestive rather than definitive. Different methods can be used for different purposes. For example, while we have heard from our stakeholders that "open houses" are forums for staff to speak, and "town halls" are opportunities for the public to speak, it is certainly true that staff can listen and take valuable feedback at open houses. Similarly, a walking tour or an ambassador can be methods to inform and/or involve the community in planning for a project.

## THE SPECTRUM OF PUBLIC PARTICIPATION

The following levels of participation describe different roles of the public in the planning and decision-making process, and the commitment made by the agency at each level. The agency’s outreach and engagement strategy should correspond to the goal of public participation at each project phase.

LEVEL →	INFORM	CONSULT	INVOLVE	COLLABORATE
<b>Goal of Outreach and Engagement</b>	We will keep you informed about the project and the decision-making process.	We will keep you informed, listen to and acknowledge concerns and aspirations, and provide feedback on how public input influenced the project and decision.	We will work with you to ensure that your concerns and aspirations are directly reflected in the alternatives developed and provide feedback on how public input influenced the project and decision.	We will look to you for advice and innovation in formulating solutions, and we will incorporate your advice and recommendations into the project and decision to the maximum extent possible.
<b>Example Tactics</b>	<ul style="list-style-type: none"> <li>• Open house</li> <li>• Newsletter</li> <li>• Webpage</li> <li>• Factsheet</li> <li>• Email</li> <li>• Social media</li> <li>• Mailer</li> <li>• Poster</li> <li>• Phone hotline</li> <li>• Ambassador</li> </ul>	<ul style="list-style-type: none"> <li>• Town hall</li> <li>• Public meeting</li> <li>• Comment form</li> <li>• Survey</li> <li>• Focus group</li> <li>• Interview</li> <li>• Tour</li> <li>• Pop-up booth</li> </ul>	<ul style="list-style-type: none"> <li>• Workshop</li> <li>• Charrette</li> <li>• Deliberative poll</li> <li>• Recurrent conversations</li> </ul>	<ul style="list-style-type: none"> <li>• Advisory committee</li> <li>• Participatory budgeting</li> <li>• Collaborative problem-solving</li> <li>• Small group dialogue</li> </ul>

*Adapted from the International Association for Public Participation (IAP2)*

The spectrum is helpful in thinking about the purpose of public outreach and engagement at different phases of a project. Typically, there is more decision space – more opportunity for meaningful public input – at earlier stages of a project (although, as noted above, even the construction phase generally allows some room for public input, even if it is more limited than at earlier phases).

At the same time, if outreach occurs too early, the project might not be well defined, and it might not be clear to the public how to provide input. The key is to think carefully about the goals of public outreach and engagement, and to time the work appropriately. It is critical for the Public Outreach and Engagement Plan to allow enough time to inform and/or engage the public before legal milestones for public comment are reached and decisions are made.

---

Division 9 – Exhibit B

Public Outreach and Engagement Plan  
Template

# Public Outreach and Engagement Plan Template

Follow the steps below to create the Public Outreach and Engagement Plan for your project. See the [Public Outreach and Engagement Plan Requirements](#) for the standards that every plan must meet, and the [Public Outreach and Engagement Plan Guide](#) for more detailed support on completing each step of the plan. When you complete the plan, submit it to the POETS page on the SFMTA intranet [here](#). **THIS STEP IS MANDATORY.** Keep in mind that your plan is a public document and may be reviewed by SFMTA leadership and staff, city partners and members of the public.

## Project Overview

**INSTRUCTIONS:** Create an initial summary of the project scope, purpose, benefits and timeline. Based on an initial understanding of the project, state the anticipated decision space – the aspects of the project that the public might be able to influence and those that cannot be changed. Note that this is a very early step in project planning and should be revised based on the subsequent Project Needs Assessment. As a general rule, the Project Overview should fit on one page. Maps or other graphics can be included on the reverse side, but the Project Overview should be a single sheet when printed.

## Project Needs Assessment

### STAKEHOLDER ANALYSIS

**INSTRUCTIONS:** Use this table to identify stakeholders – those who will be affected by, or interested in, the project. Check the categories of stakeholders who will be affected by the project, list specific individuals and groups, and classify each as either primary, secondary or partner audiences. Note that where boxes are already selected there is a presumption that these categories of stakeholders will be included in most plans. To the extent possible, classify each group as “primary,” “secondary,” or “partner.” Primary stakeholders are *directly* impacted by the project and must be informed regularly (e.g., residents, merchants). Secondary stakeholders are *indirectly* or *temporarily* impacted by the project (e.g., delivery drivers, commuters, tourists). Partner stakeholders are *influential and interested* within the project area and/or community-at-large (e.g., transit riders, bicycle advocates). Partners can affect awareness and support and may be enlisted to assist with outreach to the primary and secondary audiences and/or to champion the project.

### Stakeholders Who Reside, Work or Travel through the Project Area

**Category:** Type of Stakeholder     
 **Names:** Specific Individuals or Groups     
 **Classification:** Primary, Secondary, Partner

<input checked="" type="checkbox"/>	Residential Area	Click here to enter text.	Choose an item.
<input checked="" type="checkbox"/>	Business District	Click here to enter text.	Choose an item.

<input type="checkbox"/>	Local schools and district	Click here to enter text.	Choose an item.

## IMPACT AND INTEREST ANALYSIS

**INSTRUCTIONS:** Think about the ways that the project will affect residents, merchants, those who ride transit, and those who walk and ride bicycles on city streets. List the main impacts anticipated throughout all phases of the project. Note that the impacts identified in your plan are distinct from those detailed in an Environmental Impact Report or Environmental Impact Statement. While those documents might inform your analysis, the focus here is impacts on the local community.

After listing the project impacts, use the following table

### Impact and Interest Analysis Calculation

to calculate a score that represents the overall level of impact and interest. There is no hard and fast rule for translating the score into a particular plan, but it is an indicator of the public's likely expectations around outreach and engagement. It is intended to serve as a starting point for discussion among the project team in developing the Public Outreach and Engagement Plan.

To find your project score, answer each question by putting a number 1 in the appropriate box in each row. The table will add the numbers in each column and then multiply the total in each column by the column weight (very low = 1, low = 2, moderate = 3, high = 4, very high = 5). The table will then calculate an average score across all questions. Write the impact and interest analysis average score below.

**Impact and Interest Analysis Average Score:** [Click here to enter text.](#)

## Project Impacts

List the main impacts anticipated from the project (service changes, traffic changes, parking changes, construction, etc.)

[Click here to enter text.](#)

## DECISION SPACE ANALYSIS

**INSTRUCTIONS:** Describe the decision space of the project (the scope of potential public influence on the project or decision and the opportunities for public participation). Public participation requires the SFMTA to make a commitment to stakeholders about their involvement in the project. Defining the decision space gives the public clear expectations about their role in the planning and decision-making process. Complete the section below to identify the aspects of the project that the public can potentially influence, and the kind of public input that the project team will seek. See the Guide for a discussion of how the score on the impact and interest analysis can inform the decision space analysis.

**What aspects of the project can potentially be influenced by public input?**

[Click here to enter text.](#)

**What aspects of the project are NOT open to change based on public input, and what are the constraints that limit public influence (financial, legal, legislative, etc.)?**

[Click here to enter text.](#)

## Goals and Objectives

**INSTRUCTIONS:** List the goals and objectives of the Public Outreach and Engagement Plan for each phase of the project that the plan covers. Goals should correspond to the levels of public participation on the Spectrum of Public Participation (Inform, Consult, Involve, Collaborate). Objectives should be measurable indicators of the extent to which the goals are met. Indicate the data sources that will be used to measure progress on the objectives.

**PROJECT PHASE:** [Click here to enter text.](#)

## Key Messages

**INSTRUCTIONS:** List the key messages about the project for general and specific audiences. Be sure to include the purpose and benefits of the project, potential impacts, project timeline, opportunities for

public input, and key contacts. Where relevant, indicate the intended purpose of communication in relation to the goals of the Public Outreach and Engagement Plan (to inform, to recruit participants, etc.).

## Outreach and Engagement Techniques

**INSTRUCTIONS:** List the outreach and engagement techniques and tools you will use to achieve the goals and objectives you established for the project. Include multi-channel communications tactics, community meetings, and other ways you will reach out to stakeholders given your goals for each project phase. This step is about how to inform and engage the public, including details about implementation. This is also the appropriate step for planning language access needs.

--	----------------------------------	----------------------------------

## Budget

**INSTRUCTIONS:** Enter the estimated budget for public outreach and engagement for each project phase that the Public Outreach and Engagement Plan covers. Note: depending on the project, it might be necessary to complete this estimate before other steps in the planning process. If possible, however, the budget will be based on the Project Needs Assessment and a thorough understanding of the strategy for outreach and engagement. Note that the table below represents a budget summary which should be based on a more detailed estimate of budget line items for each phase. Note that budgeting for public outreach and engagement is more art than science and must be conducted on a project-by-project basis. Division Leads can provide support in developing your budget. The [Appendix](#) provides examples of line item budgets for other SFMTA projects.

### PUBLIC OUTREACH & ENGAGEMENT PLAN BUDGET

## SECTION 00 73 20 - EXISTING UTILITIES

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. This Section includes special requirements for existing utilities and underground facilities owned or controlled by any person or entity, private or governmental, referred to herein as "Utility Owners," which may be encountered by PPC while performing the Work.
- B. Utilities in public streets that are within the jurisdiction of the Department of Public Works shall be governed by the applicable provisions of the San Francisco Public Works Code, Sections 906, 907, 908, 909, and 910. The Utility Crossings Specifications (see Section 00 73 21) are based on agreements with non-governmental agencies for removal, support and relocation of privately-owned utility facilities.

#### 1.2 GOVERNMENTAL UTILITIES IN THE CITY OF SAN FRANCISCO

- A. PPC shall satisfactorily support, work around, and protect, as approved by the City as Regulator, all Utilities, whether shown on drawings or not, which exist within any excavation and which are owned or controlled, and maintained, by a City department or Governmental Entity, including, but not limited to, traffic control, lighting, police communication and fire alarm systems, and all conduits, wiring and related appurtenances for such systems; sewers and sewer structures; water enterprise Utilities; pipes and Utilities of the Auxiliary Water Supply System for Fire Protection; the Municipal Railway and Hetch Hetchy Water and Power overhead lines and power feeder systems serving the Municipal Railway; and other Hetch Hetchy Water and Power Utilities (together, "**Governmental Utility(ies)**").
  - 1. If Municipal Railway facilities, Hetch Hetchy Water and Power facilities serving the Municipal Railway, and other Hetch Hetchy Water and Power facilities are encountered, PPC shall support such Utilities in a manner satisfactory to the City as Regulator.
  - 2. If Auxiliary Water Supply for Fire Protection Utilities are encountered, PPC shall support such Utilities by a minimum of one cable with turnbuckle, a strongback, and a beam spanning the trench; however, where a joint falls within the trench area, a cable with turnbuckle shall be placed on each side of the joint. All such support work shall be subject to the approval of the City as Regulator before commencement thereof. After supports are removed and the pipe is sufficiently supported by partial backfill, but with the joints exposed, the pipe shall be subjected to a hydrostatic field test of 350 psi pressure in accordance with section 908.22 of the DPW Standard Specifications (refer to Division 1 for reference standards) before final backfill is placed. If a joint is visibly wet, PPC shall repair the joint in accordance with section 910 of the DPW Standard Specifications.
  - 3. If vitrified clay pipe side sewers or culverts are encountered, PPC may elect, in lieu of supporting such side sewers and culverts, to cut and restore those portions of the side sewers and culverts which obstruct the prosecution of the Work, provided that PPC complies with the provision of section 301 of the DPW Standard Specifications regarding the handling and disposal of seepage, storm water and sewage.
  - 4. Water enterprise Utilities, if encountered, shall be supported by PCC as follows:
    - a. Push-on joint pipes: Pipes shall be supported by a minimum of one cable with turnbuckle, a pipe clamp and a beam spanning the trench; however, where a joint falls within a trench area, a cable with turnbuckle and pipe clamp shall be placed on each side of the joint.

- b. Copper tubing and plastic pipes (service pipes 2 inches or smaller in diameter): If the trench is less than 8-foot wide, no support is required. For trenches wider than 8 feet, one support is required for every additional 8 feet or part thereof.
  - c. Steel welded pipes: Pipes shall be supported in a manner satisfactory to the General Manager of the Public Utilities Commission of the City and County of San Francisco.
  - d. PPC shall submit support designs for approval and start work only with approved support designs.
5. PCC shall perform the adjustment of manhole castings and other castings of Government Utilities, and the paving adjacent thereto, in accordance with the requirements of Section 217 of the DPW Standard Specifications.
- B. Supporting, working around, and protecting existing Governmental Utilities shall be considered part of the Work.

### **1.3 NON-GOVERNMENTAL UTILITIES IN THE CITY OF SAN FRANCISCO**

- A. The procedure to be followed with respect to non-governmental Utilities owned or controlled by any person, company, firm or corporation, is covered by sections 906, 907, 908, 909, and 910 of the San Francisco Public Works Code (part II, chapter X, of the Municipal Code).
- B. Principal Project Company shall be aware that agreements have been executed between various Utility Owners, and the City, enabling such Utility Owners to have included in City contracts the work of supporting, working around, and protecting their Utilities. Such work will be paid for by the various Utility Owners directly to PPC in conformance with the provisions of the Utility Crossing Specifications (Section 00 73 21). Requirements for performance of this work are also contained in the Utility Crossing Specifications.

### **1.4 ABANDONED UTILITIES**

- A. These provisions do not apply to abandoned Utilities. Any increase in the cost of PPC operations occasioned by the presence and/or removal of abandoned Utilities shall be at the sole expense of PPC and no additional payment will be made by the former Utility Operators or by the City.

### **1.5 USE OF PAVEMENT BREAKER ADJACENT TO UTILITY FACILITIES LIMITED**

- A. In accordance with the requirements of section 373 of the Public Works Code, PPC may use pavement breakers or other labor-saving devices; however, the use of any machine or device that breaks pavement by blows struck by a falling or driven hammer or weight is prohibited within a horizontal distance of 6 feet from any gas, sewer, water or Auxiliary Water Supply System pipe, communications duct or any other utility facility.
  - 1. Such prohibition, however, shall not be construed as barring the use of hand tools or manually operated air tools such as jackhammers.

## **PART 2 - PRODUCTS (NOT USED)**

## **PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## SECTION 00 73 21 - UTILITY CROSSINGS

(Effective January 1, 2023)

### SECTION U1. SUPPORT, WORK AROUND, AND PROTECT EXISTING UTILITY COMPANY FACILITIES- GENERAL SPECIFICATIONS

#### I. General

PPC shall support, work around, and protect all existing Utilities, including the Utilities of the following Utility Owners, as applicable, where Utilities exist within excavations and interfere with the prosecution of the Work because of their presence:

Pacific Gas and Electric Company (PG&E), Pacific Bell Telephone Company D/B/A AT&T California (AT&T), Comcast Corp. (Comcast), Astound Broadband, LLC dba Wave (Astound), Webpass Telecommunications LLC (Webpass), Zayo Group, LLC (Zayo), Century Link Communications LLC f/k/a Qwest Communications Company LLC (Century), Sonic Telecom, LLC (Sonic), GTE Mobilnet d/b/a Verizon Wireless (Verizon), Mobilitie, LLC (Mobilitie), Crown Castle NG West LLC (Crown Castle), ExteNet Systems (California) LLC (Extenet), MCImetro Access Transmission Services Corp., PAXIO, INC., Electric Lightwave Holdings, Inc. fka Integra Telecom Holdings, Inc. (Electric Lightwave), Mpower Communications Corporation, T-Mobile West LLC (T-Mobile), Level 3 Communications LLC (Level 3), TW Telecom of California I.p, formerly known as Time Warner Telecom of California, L.P (TW Telecom).

This Section covers supporting documentation required from PPC and direct payment by the Utility Owner to PPC, based upon existing agreements between the Utility Owners and the City, for all costs incurred as a result of the work performed by the PPC to support, work around and/or protect the existing Utility Crossings within the Project Site.

Principal Project Company shall identify in the relevant Design Documents all known Utilities and where Utility Crossing work is anticipated. Utilities which the Utility Owner intends to adjust or abandon thus eliminating the need for PPC to support, work around, or protect will also be identified.

Within 45 calendar days of NTP 1, the Utility Owners listed above, as applicable, will execute a payment agreement with the PPC and will pay said PPC directly for the work of supporting, working around, and protecting such Utilities, according to the Fixed Price Schedule, set forth in this Section 00 73 21. The Utility Owner is not required to accept or pay invoices submitted to the Utility Owner by a Subcontractor. PPC will not be allowed to mark up the invoices for the support and work around costs from any Subcontractor.

PPC shall perform the Work at Utility Crossings of other non-governmental Utilities not owned by the Utility Owners identified in this Section 00 73 21.

Any Utilities owned by Utility Owner that require relocation to avoid physical conflict with the facilities to be constructed under this Agreement will be relocated by the appropriate Utility Owner.

Utility Crossing work that is subject to the Fixed Price Schedule is not a Utility Adjustment.

#### Definitions

**Utility Crossing:** means any Utility, including a Utility main, duct structure, or service, located within an excavation area of the Work, where the Utility will remain in place and will not be relocated, abandoned in place, or removed.

**Duct Structure:** means one or more ducts, conduits or pipes, of any size, or a combination of such ducts, conduits or pipes, which are grouped together but which may or may not be banded, encased in concrete, or otherwise incorporated into a solid unit.

Nested Utilities: means facilities six- inches (6") or less in outside diameter or width and are less than 3 feet clear distance from each other regardless of ownership. In the case of nested facilities, each crossing shall be paid for according to the Fixed Price Schedule reduced by 33-1/3%.

Abandoned Utilities: means those Utilities identified by the Utility Owner as Utilities that the Utility Owner has stopped using with the intent of never using again.

Inactive/Deactivated Utilities: means those Utilities that Utility Owner identifies as Utilities that Utility Owner has temporarily stopped using with the possible intent of future use.

### **Fixed Price Schedule**

Utility Crossings where the length of the Utility is not more than 3 times the width of the excavation for excavation widths less than 18 feet, shall be priced pursuant to the "Fixed Price Schedules" set forth in this Section 00 73 21, and submitted to the Utility Owner for payment.

Excavation width will be the outside diameter or width of the City-owned structure plus 3 feet. The length of a Utility Crossing is the centerline distance, in feet, of the portion of the Utility within the excavation area.

### **Utility Co. Facility Support, Etc., Work Located in Contract but Utility Contract Drawings Omitted from Contract**

In the event that information from the Utility Owners listed in this Section 00 73 21, as applicable, are not included in the Agreement but the cost estimate and general location of the support, work around and protect work are known and included in the Contract Documents, all such work performed will be paid for by the Utility Owner according to the Fixed Price Schedule hereinafter set forth.

### **Utility Co. Facility Support, Etc., Work Overlooked, Unexpected, and Not Shown on Utility Contract Drawings, but Ownership Known**

Support, work around and protect work for those Utility Crossings overlooked, unexpected, and not shown on information provided by Utility Owners will be paid for by the Utility Owner according to the Fixed Price Schedule set forth in this Section 00 73 21 plus an additional fifteen (15) percent surcharge for Principal Project Company's profit and overhead.

### **Negotiated Payment**

Notwithstanding the Fixed Price Schedules hereninafter set forth, the Utility Company and the PPC shall directly negotiate the costs for:

- "Parallel" Utility Crossings,
- Utility Crossings with lengths more than three times the width of the excavation, and/or
- Where the computed cost of any crossing exceeds **\$12,748**.

If a public or private Utility is located longitudinally and directly on top of the Project trench or multiple Utilities crossing the Project trench are located too close to each other leaving no space in between for the PPC to excavate and shore the trench, and there is a need to change the construction method to install Project facilities, then the increased cost shall be shared by Utility Owners and Principal Project Company based on the number, size, and ownership of each Utility.

### **Abandoned or Inactive/Deactivated Facilities**

#### Abandoned Utilities

Abandoned Utilities are those Utilities identified by the Utility Company Owner identifies abandoned facilities as facilities Utilities that they have Utility Owner has stopped using with the intent of never using again. Utility Owner may, but is not required to, specify abandoned Utilities materials it furnishes to support Utility work, including Utility Crossings. If PPC encounters unidentified Utilities during construction, PPC shall notify the Utility Owner in

accordance with paragraph "Unexpected or Unidentified Utilities". The Utility Owner inspector shall visit the site within 24 hours or the time required in Utility contracts with the City to confirm that the Utility is abandoned. If the Utility Owner fails to confirm that the Utility is abandoned, the PPC will receive full payment per Fixed Price Schedule for support, work around and protect work performed.

#### Inactive/Deactivated Utilities

Utility Owner will specify materials it furnishes to PPC to support Work related to Utilities and Utility Crossing any inactive Utilities. The PPC will perform support, work around, and protect around inactive Utilities unless otherwise instructed by the Utility Owner.

#### Removal of Abandoned Utilities or Inactive Utilities

If necessary to construct the Project, the removal of abandoned or inactive Utilities that the Utility Owner determines it intends to abandon will be at the PPC's sole expense, except for removal of duct banks, and conduits or pipes larger than twelve-inch (12") in outside diameter owned by the Utility Owners. Utility Owner and the PPC will negotiate the cost for removal of such Utility Owner duct banks, and conduits or pipes larger than twelve-inch (12") in diameter.

#### **Payment Only for Work Performed by the PPC**

The Utility Owner will not pay the PPC unless actual work to support, work around and/or protect the Utility Owner's Utilities was performed. No payment shall be due to the PPC if the Utility Owner crews respond and are supporting, working around, and/or protecting their Utilities, such as in an emergency, or if the PPC does not actually perform any work or undertake any action to support, work around or protect the Utility Owner's Utilities.

## **II. Contract Activities**

### **Utility Crossing Measurement**

The PPC shall measure the outside diameter or width of Utility Crossings to the nearest inch (outside diameter **excluding** any fittings, bells, or gate valves) and length of the Utility Crossings to the nearest foot to determine the cost of each Utility Crossing according to the Fixed Price Schedule hereinafter set forth.

### **Utility Company's Right of Confirmation**

The Utility Owner shall have the right to confirm measurements with the PPC but all disagreements shall be resolved without delay to the Project Schedule.

### **Variations and Cost Adjustments**

The PPC shall notify the Utility Owner immediately of any variation of Utility Crossings from the materials furnished by the Utility to support Work related to Utility Crossings and estimate the required cost adjustment for such variations. Cost adjustments shall be settled within no more than two Days.

### **Verification and the PPC Itemization**

PPC shall keep an itemized record of the Utility Crossing work done, noting any variations from the materials furnished by Utility Owners to support Work related to Utility Crossings and estimates. The itemized record shall be maintained and copies submitted monthly to the Utility Owner and the City for information.

### **Supporting Documentation for City Projects other than Spot Sewer Repair Contracts**

The PPC shall, at a minimum, submit the following supporting documentation with each invoice submitted to the Utility Owner for payment:

- Utility Crossing support and work around summary and Design Documents for support and work around invoice for utilities" identifying the Utility Owner reimbursed work by type of Utility, and shall include following:

- Identification of all Utility Crossings by alpha-numerical numbering system (e.g., E1, E2, G1, G2);
- Location and size of all Utility Crossings
- Length of all Utility Crossings
- Photos of following Utility Crossings:
  - Utility Crossings where the size of the Utility varies from that shown on Design Documents or estimates; any change of measurement requires one photo per block per size variation.
  - Utility Crossings not shown on Utility Owner's Utility Contract Drawings or estimates.
  - Parallel Utility Crossings showing measurements and potential facilities support
  - Utility Crossings six-feet (6') or longer unless:
    - Shown on Utility-furnished materials and/or estimates and no variance.
    - Utility is a lateral that is crossing the excavations having 6 feet or greater trench width and crossing length does not exceed the trench width.

### **Supporting Documentation for Spot Sewer Repair Contracts**

The PPC shall, submit the following documentation with each invoice submitted to the Utility Owner for payment for spot sewer repair contracts:

- A summary of Utility Crossing support and work around.
- Support and work around invoice for Utility Crossings identifying company reimbursed work by block, type of Utility and shall include following:
  - Identification of all Utility Crossings by alpha-numerical numbering system (e.g., E1, E2, G1, G2);
  - Location and size of all Utility Crossings
  - Length of all Utility Crossings.
  - Invoice and as-built templates shall be utilized and all information filled out in its entirety (e.g. PPC representative's name and signature, date, etc.)
- Photos of following Utility Crossings:
  - All Duct Bank Structures and related measurements
  - All Utility Crossings six-feet (6') or greater in length
  - All unmarked active Utility Crossings that are supported
  - Each utility that varies in size and/or location from USA street marking(s).
- Underground service alert ticket number

### **Photos**

All photos must include:

- Label with Utility Crossing reference number
- Name of street or intersection
- Above-ground picture that includes a landmark (street sign, or house) that helps identify location of the crossing.

**Unexpected or Unidentified Utilities**

If, during the course of the work, an unexpected or unidentified interference is discovered, the PPC shall immediately call this fact to the attention of all Utility Owners, including appropriate City Departments. The City Departments and Utility Owner shall have 48 hours from receipt of such notification including at least 8 working hours to determine ownership and provide direction to the PPC for disposition of the Utility which are not in direct conflict with the Work and can be supported, worked around and protected in the trench. However, if the unidentified facility is in direct physical conflict with the City Project work and the PPC cannot proceed further without resolution, the Utility Owner and City Departments will visit the site as soon as possible within the 24 hours from receipt of such notification to determine ownership and provide direction to the PPC. The time allowance shall include at least 8 working hours. If the ownership of the unidentified Utility is unknown, the PPC shall call Underground Service Alert (USA) requesting Utility Companies to visit the site to identify the ownership. If no determination can be made after the aforementioned procedure is followed, the PPC will follow the direction of the City or authorized designee to either remove the facility as abandoned or support and work around the Utility. Disposition shall be in accordance with the applicable requirements of Section 00 73 20, Article 1.3, if such Utilities are owned by Utility Owners other than the Utility Owners listed above. If ownership is by one or more of the Utility Owners listed above, disposition shall be as hereinbefore set forth under the heading, "Utility Owner Utility Support, Etc., Work Overlooked, Unexpected, and Not Shown on Utility Contract Drawings, But Ownership Known." If the City directs the PPC to support and work around a Utility whose ownership is unknown and cannot be confirmed that it is abandoned, support and work around work of such Utility will be paid for by the City according to the Fixed Price Schedule hereinafter set forth plus an additional fifteen (15) percent surcharge for PPC's profit and overhead.

**Progress Payments**

Progress payment for completed Utility Crossing work shall be made by the Utility Owner within ninety (90) days of receipt of an invoice from the PPC submitted along with the supporting documentation listed above.

**III. METHOD OF DETERMINING UTILITY CROSSING COSTS**

**Fixed Price Schedule**

The cost of support, work around and protection of Utility mains, duct structures and services shall be based on the outside diameter or width of said Utilities and the length of the Utility Crossing.

In the following schedules the maximum outside diameter shall mean outside diameter of pipe, conduit, service, duct or main **excluding** any fittings, bells, or gate valves, and width shall mean the distance measured horizontally across the duct structure.

**Cost of Utility Crossing = Fixed Cost + Support Cost Group I: Length of Crossing less than Six (6) Feet**

<b>Maximum Outside Diameter Of Main And Service Or Width Of Duct Structure</b>	<b>Fixed Cost</b>	<b>Support Cost Per Foot of Length of Crossing</b>
4 inches or less	<b>\$717</b>	0
Over 4 inches to 20 inches	<b>\$717 + \$119</b> per inch over 4 inches	0
Over 20 inches	<b>\$2,628 + \$199</b> per inch over 20 inches	0

**Group II: Length of Crossing Six (6) Feet to Twelve (12) Feet**

<b>Maximum Outside Diameter Of Main And Service Or Width Of Duct Structure</b>	<b>Fixed Cost</b>	<b>Support Cost Per Foot of Length of Crossing Over Six Feet</b>
4 inches or less	<b>\$916</b>	<b>\$119</b>
Over 4 inches to 20 inches	<b>\$916 + \$127 per inch over 4 inches</b>	<b>\$119</b>
Over 20 inches	<b>\$2,955 + \$215 per inch over 20 inches</b>	<b>\$119</b>

**Group III: Length of Crossing Greater than Twelve (12) Feet**

<b>Maximum Outside Diameter Of Main And Service Or Width Of Duct Structure</b>	<b>Fixed Cost</b>	<b>Support Cost Per Foot of Length of Crossing Over Twelve Feet</b>
4 inches or less	<b>\$1,633</b>	<b>\$159</b>
Over 4 inches to 20 inches	<b>\$1,633 + \$143 per inch over 4 inches</b>	<b>\$159</b>
Over 20 inches	<b>\$3,926 + \$239 per inch over 20 inches</b>	<b>\$199</b>

## **SECTION U2. SUPPORT, WORK AROUND, AND PROTECT EXISTING PACIFIC GAS AND ELECTRIC COMPANY (PG&E) UNDERGROUND FACILITIES - STANDARD TECHNICAL SPECIFICATIONS**

The requirements for supporting, working around, and protecting existing Pacific Gas and Electric Company (PG&E) underground electric, gas and steam Utilities are as follows:

For pipe and conduit in sizes up to and including 6 inches inside diameter, spans of less than 6 feet shall be considered self-supporting unless otherwise directed by the City or by the PG&E inspector through the City. Spans of 6 feet and more, but not to exceed 12 feet, shall be supported by a beam with at least one cable and turnbuckle. For spans over 12 feet, an additional cable and turnbuckle shall be installed for each additional 6 feet or fraction thereof of span. Cables and turnbuckles shall be located to support joints, valves and other fittings. Cast iron joints and valves, where encountered, shall be supported on both sides.

For pipe and conduit in sizes larger than 6 inches inside diameter, spans shall be supported by beams with cables and turnbuckles located at intervals not to exceed ten times the diameter of the pipe measured in inches, unless otherwise directed by the City or the PG&E inspector through the City. Cable and turnbuckles shall be located to support joints, valves, and other fittings. Cast iron joints and valves, where encountered, shall be supported on both sides.

Concrete-encased duct lines and/or concrete-encased steam lines shall not be considered as

self-supporting, but may be so designated by the City or PG&E inspector through the City, upon a visual examination of the concrete envelope.

Beams, cables and turnbuckles for supporting steel pipe and/or conduit shall be adequately sized to limit the deflection so as not to exceed length of span in feet divided by 360.

### **Length of Span in Feet**

Beams, cables and turnbuckles used for supporting cast iron pipe shall be adequately sized to ensure that no deflection will occur.

Beams, cables and turnbuckles used for supporting concrete encased duct lines and/or concrete encased steam lines shall be adequately sized and spaced to ensure that no deflection will occur.

For multi-way conduits, spacers shall be placed to maintain conduit separation at point of support. 2-inch x 4-inch wood softeners shall be used with all cable slings to prevent damage to pipe, coating, wrapping or concrete encasement. However, slings supporting unreinforced concrete encased pipe must also incorporate strongbacks to prevent cracking of concrete.

PPC shall exercise due care to avoid damage to pipe and pipe coatings, wrapping or concrete encasement. To help prevent damage to gas pipelines and other PG&E underground utilities, call 811 at least two (2) working days before and up to fourteen (14) days in advance of an excavation so that all crossings can be verified. Should PPC damage or displace any PG&E facility: move to a safe location, call 911, and then contact PG&E at 1-800-743-5000 (gas and electric facilities). Repairs or replacements will be made by the PG&E.

### **SECTION U3. SUPPORT, WORK AROUND, AND PROTECT EXISTING PACIFIC BELL TELEPHONE COMPANY D/B/A AT&T CALIFORNIA (AT&T) UNDERGROUND UTILITIES - STANDARD TECHNICAL SPECIFICATIONS**

#### **General**

The requirements for supporting, working around, and protecting existing AT&T underground Utilities are as follows:

#### **Requirements for Supporting AT&T Ducts**

A single duct spanning less than 6 feet shall be considered self-supporting unless otherwise directed by the City or by the AT&T inspector through the City.

A single duct spanning more than 6 feet shall be supported by a beam with at least one cable and turnbuckle. For spans over 12 feet, an additional cable and turnbuckle shall be installed for each additional 6 feet or fraction thereof of span. Cables and turnbuckles shall be located to support duct joints.

Duct structures consisting of 2 or more single ducts not encased in concrete and spanning more than 4 feet, shall be banded with at least 2 bands and supported by a beam with at least one cable and turnbuckle. For spans over 8 feet, an additional set of bands, cable and turnbuckle shall be installed for each additional 4 feet or fraction thereof of span. Banding of ducts shall be done in such a manner as to not distort the normal configuration of the structure.

Duct structures consisting of 2 or more single ducts, encased in concrete and spanning more than 4 feet, shall be supported by a beam with at least one cable and turnbuckle. For spans over 8 feet, an additional cable and turnbuckle shall be installed for each additional 4 feet or fraction thereof of span.

Multiple-duct structures of vitrified clay and/or concrete shall be supported for the complete width of the trench. The support shall consist of planking or beams equal in width to the width of the structure and banded to it. This structure in turn shall be supported by a beam with at least one cable and turnbuckle placed every 4 feet or fraction thereof so as to maintain the existing position and alignment of the duct structure.

Duct structures consisting of dissimilar conduit materials shall be supported in the manner applicable to the most fragile portion of the structure.

#### **Requirements for Protecting AT&T Ducts**

Single ducts shall be protected if required. This determination will be made by the City or by the AT&T inspector through the City.

Duct structures having top and bottom wood planking or encased in concrete will not require additional protection unless otherwise directed by the City or by the AT&T inspector through the City.

All other multiple duct structures, with the exception of steel pipe in good condition, shall be protected by the placement of wood planking or sheeting no less than 1/2-inch in thickness and equal in width to the width of the structure.

#### **Damage or Displacement of AT&T Utilities**

Should PPC damage or displace any AT&T owned facility, the Cable Maintenance Department of AT&T shall be notified immediately by calling 611, press Option 1, and then Option 5. Repairs or replacements will be made by AT&T.

## **SECTION U4. SUPPORT, WORK AROUND, AND PROTECT EXISTING COMCAST CORP. (COMCAST) UNDERGROUND UTILITIES - STANDARD TECHNICAL SPECIFICATIONS**

### **General**

The requirements for supporting, working around, and protecting existing Comcast underground Utilities are as follows:

#### **Requirements for Supporting Comcast Corp. Ducts**

A single duct spanning less than six (6) feet shall be considered self-supporting, unless otherwise directed by the Comcast engineering coordinator or the Comcast inspector, through the City.

A single duct spanning more than six (6) feet shall be supported by a beam with at least one cable and turnbuckle. For spans over twelve (12) feet, an additional cable and turnbuckle shall be installed for each additional six (6) feet or fraction thereof of span. Cables and turnbuckles shall be located to support duct joints.

Duct Structures consisting of two (2) or more single ducts spanning more than four (4) feet shall be banded with at least two (2) bands and supported by a beam with at least one (1) cable and turnbuckle. For spans over eight (8) feet an additional set of bands, cable, and turnbuckle shall be installed for each additional four (4) feet or fraction thereof of span. Banding of ducts shall be done in such a manner as to not distort the normal configuration of the structure.

Duct structures consisting of dissimilar conduit materials shall be supported in the manner applicable to the most fragile portion of the structure.

#### **Requirements for Protecting Comcast Ducts**

Single ducts shall be protected if required. This determination will be made by the Comcast engineering coordinator or by the Comcast Corp. inspector, through the City.

Duct Structure having top and bottom wood planking will not require additional protection unless otherwise directed by the Comcast engineering coordinator or the Comcast Corp. inspector through the City.

All other multiple duct structures shall be protected by the placement of wood planking or sheeting no less than 1/2-inch in thickness and equal in width to the width of the structure.

#### **Damage or Displacement of Comcast Facilities**

Should PPC damage or displace any Comcast owned facility the proper authorities shall be notified immediately by calling 1-888-824-8399. Repairs or replacements will be made by Comcast

## **SECTION U5. SUPPORT, WORK AROUND, AND PROTECT EXISTING MUNI TRANSIT POWER (MTP) UNDERGROUND FACILITIES - STANDARD TECHNICAL SPECIFICATIONS**

### **General**

The requirements for supporting, working around, and protecting existing Muni Transit Power (MTP) underground conduit and ducts are as follows:

#### **Requirements for Supporting MTP Conduits and Ducts**

Steel conduit spanning less than six feet shall be considered self-supporting unless otherwise directed by the City or by the MTP inspector through the City.

Steel conduit spanning six feet and more shall be supported by a beam with at least one cable and turnbuckle. For spans over 12 feet, an additional cable and turnbuckle shall be installed for each additional six feet or fraction thereof of span. Cables and turnbuckles shall be located to support duct joints.

Beams, cables and turnbuckles for supporting steel conduit shall be adequately sized to limit the deflection so as not to exceed length of span in feet divided by 360.

Spacers shall be placed between multiple conduits in a manner to maintain conduit separation at points of support.

Concrete-encased ducts spanning more than four feet shall be supported by a beam with at least one cable and turnbuckle. For spans over eight feet, an additional cable and turnbuckle shall be installed for each additional four feet or fraction thereof of span for the complete width of the excavation.

Beams, cables and turnbuckles for supporting concrete-encased duct lines shall be adequately sized and spaced to insure that no deflection will occur.

PPC shall provide adequate support and protection to prevent differential movement at the juncture of manholes and duct banks.

Duct structures consisting of dissimilar conduit materials shall be supported in the manner applicable to the most fragile portion of the structure.

#### **Requirements for Protecting MTP Conduits and Ducts**

Steel conduit shall be protected if required. This determination will be made by the City or by the MTP inspector through the City.

Duct structures having top and/or bottom wood planking or encased in concrete will not require additional protection unless otherwise directed by the City or by the MTP inspector through the City.

All other duct structures, such as unprotected tile and the like, shall be adequately protected by the placement of wood planking or sheeting no less than 1/2-inch in thickness and equal in width to the width of the structure. The top, bottom and sides shall be covered as necessary, depending on PPC's operations and the conditions of the work.

#### **Damage or Displacement of MTP Facilities**

Should PPC damage or displace any MTP-owned facility, John Orkes, Overhead Lines Superintendent of the Traction Power Group (TPG), shall be notified immediately by calling 1-415-554-9221. Repairs or replacements will be made by MTP.

**Conduits to Pole Risers to be Considered as Services**

For the purpose of payment, conduits that run directly from a manhole or pull box to a pole riser shall be considered to be a service and will be paid for according to the Cost of Utility Crossing Schedule above (III. METHOD OF DETERMINING UTILITY CROSSING COSTS).

**END OF SECTION**

## SECTION 01 12 00 - SPECIAL INSTRUCTIONS

### PART 1 - GENERAL

The following conditions apply to the Work / Project.

- A. Principal Project Company shall comply with Article 37 of General Order 95 of the Public Utilities Commission State of California. CAL OSHA regulations require that any equipment that moves vertically must maintain a 10 feet radial clearance, and any other equipment must maintain a 6 feet clearance from SFMTA overhead electric wires. The Principal Project Company shall observe these regulations during the entire duration of the construction work. The Principal Project Company shall choose the appropriate construction means and methods to meet all CAL-OSHA rules and regulations while accommodating MUNI's operational and facility's requirements.
- B. Relocating or isolating/re-energizing MUNI overhead wires will not be allowed for roadway related work, which includes, but is not limited to curb ramps, curbs, gutters, sidewalk, parking strips, paving, and adjustment of castings.
- C. Initial Curb Ramps: The Principal Project Company shall complete the construction of the initial curb ramps at two curb returns and have them inspected and approved by the City as Regulator prior to proceeding with construction of the other curb ramps. No additional curb ramps shall be constructed until the City as Regulator has approved the initial curb ramps. Inspection will include workmanship, color, finishes, and to verify that the curb ramps conform to the plans and specifications. The approved initial curb ramps shall be a standard of comparison for all curb ramps work.
- D. The Principal Project Company shall ensure that the existing fire hydrants on site are not removed or relocated prior to curb ramp layout. The existing fire hydrant and flange shall be removed prior to final curb ramp or concrete finishing.
- E. The Principal Project Company shall ensure there is proper coordination of new fire hydrant and water meter box locations with new curb ramp construction locations, so that new fire hydrants and water meter boxes do not negatively impact the curb ramp design requirements in accordance with SFDPW Standard Plans 102,854 thru 102,864.
- F. The Principal Project Company shall use proper equipment to prevent unnecessary damage to public and private property not otherwise part of the Project or identified as part of the Work such as no heavy equipment on the top of sidewalks.
- G. The Principal Project Company shall use temporary hot mix asphalt concrete to provide longitudinal and/or transverse transitions with a slope of 1:18 between the newly constructed concrete base, manhole, etc. and existing pavement (whenever the difference in the grade of the pavement and the concrete base, manhole, etc. exceeds 3/4 inch) by the end of the work shift or before opening the lanes to traffic. Temporary hot mix asphalt paving shall conform to Section 211.01 of DPW Standard Specifications. Installing and removing temporary paving shall be considered incidental work.
- H. Five (5) working days prior to the commencement of Construction Work, Contractor shall notify Mark Middleton of the San Francisco Public Utilities Commission at (415) 262-2144 or (415) 254-3538 to schedule removal of flow meters installed in sewer manholes, if encountered within the work scope.
  1. Three days (3) after completion of sewer work, Principal Project Company shall contact Mark Middleton for PUC to reinstall flow meters at affected locations.

**THIS APPLIES TO THE REMOVAL OF EXISTING BUS SHELTERS AND INSTALLATION OF NEW BUS SHELTERS AND CORRESPONDING ELECTRICAL CONDUITS WITH CLEAR CHANNEL.**

- I. The Principal Project Company shall coordinate all bus shelter work with SFMTA and Clear Channel. Clear Channel will coordinate the removal of existing bus shelter with Principal Project Company in order to minimize bus shelter down time. Principal Project Company shall verify the new bus shelter locations with Clear Channel on site. After demolition and removal of the existing concrete pavement, Principal Project Company shall allow a maximum of five (5) working days for Clear Channel to install the underground electrical conduits and pull boxes at each bus shelter location. Principal Project Company is to contact Clear Channel and SFMTA for the new bus shelter installation after sidewalk construction has been completed.
- J. If completion of the Work will require temporary closure of the roadway, such closure shall be coordinated so that neighbors are as minimally impacted as possible in multiple phases of construction.
- K. Principal Project Company shall coordinate with Recology for neighborhood garbage collection at the Project Site.
- L. Principal Project Company shall coordinate with neighbors and the City's Authorized Representative to allow for ingress and egress to properties during construction.
- M. Contractor shall not have more than 0.5 acres open with active construction at any one time in the public right-of-way.
- N. Contractor shall notify the SFMTA Meter Shop ten (10) business days prior to demolition work in areas with parking meters and once parking areas are reopened to the public.
- O. Contractor shall notify the MTA Meter Shop ten (10) business days in advance of new concrete sidewalk pours to coordinate the installation of parking meter sleeves in new concrete sidewalk areas.
- P. Tree trimming, replanting and removal shall be coordinated with BUF (Bureau of Urban Forestry). Provide ninety (90) calendar day notice. Tree removal or relocation shall require a permit application and fee to BUF.
- Q. Contractor shall notify owners of sub-sidewalk basements in writing at least 30 days prior to performing any work within sub-sidewalk basements to coordinate access to the basements.
- R. Only temporary overlay pavement markers shall be placed on top of the micro-surfacing finished work areas. Temporary tape traffic striping may be placed in areas after the permanent striping has been removed. Temporary tape traffic striping shall be removed before the area has micro-surfacing work performed.

**PART 2 - PRODUCTS (NOT USED)**

**PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## **SECTION 01 13 00 - OVERHEAD CONTACT SYSTEM (OCS) ISOLATION AND REPLACEMENT**

### **PART 1 - GENERAL**

#### **1.1 OVERHEAD CONTACT SYSTEM (OCS) ISOLATION**

- A. Principal Project Company shall perform, but not be limited to, the following tasks to complete OCS isolation work:
  - 1. Traffic control work for de-energization and re-energization related to OCS isolation work;
  - 2. Preparing A site specific work plan (SSWP);
  - 3. Attend all necessary safety training and be certified by SFMTA as required before starting said work;
  - 4. Principal Project Company shall sign a SFMTA Safety Training Waiver for OCS de-energization with respect to the safety training;
  - 5. Obtain approval of submittals and clearance permit from SFMTA Operations Control Center (OCC) before beginning said work. SFMTA OCC permit application procedure will be discussed as part of the SFMTA safety training;
  - 6. support during de-energization and re-energization of OCS (isolation of OCS) including support regarding installation and removal of sectional insulators; and
  - 7. Perform all related and incidental work required for the isolation of wires in accordance with Technical Requirements and General Order 95 Cal-OSHA requirements.

### **PART 2 - PRODUCTS (NOT USED)**

### **PART 3 - EXECUTION**

#### **3.1 OVERHEAD CONTACT SYSTEM (OCS) REMOVAL**

- A. Principal Project Company shall complete all scope of work as shown in the SFMTA approved OCS disconnection, cut, salvage-in-place, and removal plan.
- B. Principal Project Company shall complete all scope of work as shown in the SFMTA approved new OCS replacement, installation, and re-energization plan.

**END OF SECTION**

## SECTION 01 14 00 - ARTWORK COORDINATION

### PART 1 - GENERAL

#### 1.1 DEFINITIONS

- A. San Francisco Arts Commission (Arts Commission) shall mean the Charter-established City agency that has jurisdiction over all art belonging to the City and charged with the preservation and care of this Artwork.
- B. San Francisco Arts Commission Public Art Program shall mean the department responsible for the commissioning of permanent public Artworks to be accessioned into the Civic Art Collection as required by the City's Art Enrichment Ordinance.
- C. Artist shall mean a person that designs the Artwork and consults on its fabrication and installation through a separate contract with the City, under the supervision of the San Francisco Arts Commission.
- D. Artwork shall mean:
  - 1. Artist-designed graphics integrated into the architectural glazing of the bus ramp on 17th Street measuring approximately 11,000ft<sup>2</sup>, facing Franklin Square.
  - 2. Artist-designed graphics integrated into the architectural glazing of a multi-story stairwell measuring approximately 3,800ft<sup>2</sup>, located on Mariposa Street at York Street.
  - 3. Large-scale tile Artwork on building façade measuring approximately 3,000ft<sup>2</sup>, located on 17th Street at Bryant Street.
- E. Public Art Project Manager shall mean the person that represents the San Francisco Arts Commission Public Art Program.

#### 1.2 SUMMARY

- A. Section includes:
  - 1. Requirements for installation of Artwork that has been designed for this Project under the direction of the San Francisco Arts Commission (SFAC) Public Art Program.
    - a. SFAC Public Art Project Manager for this Project, shall be the contact person for all aspects related to the Artwork; coordinate the work of the various artists, and shall receive copies of all communications concerning aspects of the Project Schedule that are pertinent to the Artwork, site preparation, coordination, delivery, installation, and protection of the Artwork.
    - b. For Tile Artwork:
      - 1) Artwork will be produced by Artist under a separate agreement with the City/San Francisco Arts Commission.
      - 2) Principal Project Company shall coordinate any and all work related to the installation of Artwork with the Public Art Project Manager.
    - c. For Glass Artworks:
      - 1) Artwork digital files will be furnished by the SFAC Public Art Manager.

- 2) Principal Project Company shall coordinate all aspects of fabricating the Artwork in consultation with the SFAC Public Art Project Manager.
  - 3) Principal Project Company shall coordinate all aspects of transportation, acceptance and handling of Artwork (e.g., Artwork crates), installation schedule and protection of Artwork, as applicable.
  - 4) Principal Project Company shall coordinate any and all work related to installation of Artwork with the SFAC Public Art Project Manager.
- d. Principal Project Company shall coordinate all aspects of acceptance, storage, transportation, and installation of Artwork including, but not limited to the following:
- 1) Provide the Arts Commission with shop drawings showing the field verified and hold dimensions, materials of walls where Artwork will be installed.
  - 2) Provide Project Schedule updates to include transportation, unpacking, installation, protection, and cleaning of Artwork.
- e. Principal Project Company shall coordinate all work related to installation of Artwork with the Public Art Project Manager.

B. San Francisco Arts Commission Contact Person:

1. Public Art Project Manager:

Jackie von Treskow  
 Senior Program Manager, Public Art  
 San Francisco Arts Commission  
 401 Van Ness Avenue, Suite 325  
 San Francisco, CA 94102  
 Telephone: (415) 252-2225  
 Email: jackie.vontreskow@sfgov.org

2. Artists' Contact Information:

a. TBD

C. Artwork:

1. Artworks include but are not limited to:

- a. **Artwork graphics** for incorporation into of 17th Street Bus Ramp and Mariposa and York Stairwell glazing.
- b. **Graphic ceramic tiles** to be installed on the building exterior.

2. For Glass Artwork:

- a. Artwork shall consist of decorative glass units for installation into the building's curtain wall system.
- b. Final selection of glass type to be determined through the further development of the specification via the sample review process with the artist and selected vendor.
- c. All treatments must have a warranty of 10 years, without degrading or fading.

3. For Tile Artwork:
  - a. Artwork shall consist of ceramic tiles for installation on the building façade.
  - b. The Arts Commission shall provide and arrange for delivery of Artwork to the Principal Project Company-provided secure, weatherproof, conditioned storage site within a thirty-mile radius of San Francisco for temporary storage prior to installation by the Principal Project Company into the Infrastructure Facility as indicated on the Final Design Documents.
  - c. Principal Project Company shall coordinate the receipt of Artwork, inspection, storage, field verification of site conditions, transportation from storage to project site and installation of the Artwork and related contract activity, provide services as specified in this Section, and protect Artwork during and after installation until Final Acceptance.
4. Artwork must be integrated with construction of the Infrastructure Facility and installation coordinated and scheduled to align with the work and schedule of other trades.
5. Principal Project Company shall include Artwork installation and protection as an activity in the Principal Project Company's Project Schedule based on coordination discussions during the pre-installation conference(s). Principal Project Company shall notify the Public Art Project Manager in writing of all changes in the Project Schedule related to the Artwork(s), and is responsible for contacting the Public Art Project Manager with specific installation dates for the Artwork no less than 90 days in advance of installation.

### **1.3 SCHEDULING**

- A. Principal Project Company's Project Schedule shall include the following milestones:
  1. Date of delivery of Artwork to the Project Site;
  2. Date(s) of pre-installation Conference(s)
  3. Dates of Artwork installation
  4. Date of Artwork acceptance.
- B. Additional activities shall include, but not be limited to the following: pre-production, submittals, shop drawings, samples, and field inspections.
- C. Upon completion of installation, inspection will be scheduled with Artist, Public Art Project Manager, Principal Project Company, and the City's Authorized Representative for final acceptance of the Artwork. If repairs to the Artwork are required, the Principal Project Company shall complete these and other punch list items before approval by Artist, Public Art Project Manager, and the City's Authorized Representative.

### **1.4 SUBMITTALS**

Principal Project Company shall prepare and submit the following to the Public Art Project Manager, Artist(s), and City's Authorize Representative. No work shall proceed until shop drawings of the Artwork are approved by the Arts Commission and Artists:

- A. Shop Drawings:
  1. Base drawings for layout of Artwork: shall include areas receiving Artwork, incorporate field-verified finish dimensions of the overall area, locations and dimensions of openings, construction, joint layouts, descriptions of finish and structural support details. The

submitted base drawings shall be the basis for the artists to provide rough layout guidelines for the Principal Project Company to prepare final installation shop drawings indicated below.

2. Protection Plan: location and information regarding storage location for the Artwork, protection materials and necessary equipment, attachment details, and work plan to protect installed Artwork in-place until project completion.

B. Product Data:

1. Manufactured Products, including Sealants.
2. Manufacturer's specifications, recommendations, and installation instructions - including cleaning and preparation of substrates for each product to be used.
3. Protection materials and equipment.

C. Samples:

1. For Glass Artwork:

a. Minimum 12" x 12" samples to be provided.

- 1) Submit up to 6 initial 12"x 12" square samples to show full range of colors, details of graphics, and visual transparency. Adjustments by Artist to Artwork digital graphics files may be made by Artist in response.
- 2) Submit up to 6 additional 12"x12" samples based on adjusted graphics.

b. Minimum 24" x 24" samples to be submitted following approval of 12"x12" samples.

- 1) Submit up to 2 initial 24"x24" square samples to show full range of colors, details of graphics, and visual transparency. Adjustments by Artist to Artwork digital graphics files may be made by Artist in response.
- 2) Submit up to 2 additional 24"x24" square samples based on adjusted graphics.

c. For Tile Artwork: Color samples of sealants, grouts and any other Principal Project Company-provided materials exposed to view.

d. Protection materials.

2. Quality Control: Statement of qualifications for each installer related to Artwork. The Principal Project Company shall provide supporting documentation indicating past experience for each installer upon request of the Arts Commission.

## 1.5 PRE-ARTWORK INSTALLATION CONFERENCES

- A. Principal Project Company to provide no less than 14 days advance notice and confirm attendance by Public Art Project Manager, Artist, and City's Authorized Representative.

## 1.6 IDENTIFICATION AND RESPONSIBILITY

- A. Unless otherwise indicated, all items of work associated with the receipt of Artwork, initial inspection, storage, transportation, installation and protection of the Artwork indicated are the Principal Project Company's responsibility.

- B. Principal Project Company shall jointly inspect the condition of each piece of Artwork with the Arts Commission upon receipt of Artwork delivery at the Principal Project Company's storage site and shall re-package the Artwork to the satisfaction of the Arts Commission after the inspection for storage and for subsequent transportation to the Project Site.
- C. Installation requirements shall be as specified and as shown on the Principal Project Company's approved installation shop drawings. Artist and the Arts Commission shall be responsible for reviewing and approving the Principal Project Company-prepared installation shop drawings. Principal Project Company shall be responsible for preparation of substrates, wall recesses and openings, surfaces, and finishes in accordance with the approved shop drawings.
- D. Principal Project Company Responsibilities. Principal Project Company shall:
  - 1. Submit all Submittals as specified in this Section 01 14 00.
  - 2. For Glass Artwork:
    - a. Coordinate sampling process with the SFAC Public Art Project Manager.
    - b. Coordinate the fabrication of Artwork in accordance with the requirements of SFAC.
  - 3. For Tile Artwork: Prepare substrates, surfaces, and finishes receiving and/ or surrounding Artwork.
  - 4. Receive, inspect, handle, repackage, protect, and store Artwork at an approved storage location not at the project construction site, and transport Artwork from the storage location to the Project Site for installation.
  - 5. Install Artwork as shown on reviewed and approved shop drawings, under the supervision of the Arts Commission, Public Art Project Manager, Artist, and the City's Authorized Representative.
  - 6. Develop installation schedule in consultation with Arts Commission for each Artwork element. Notify the Arts Commission of installation schedule for each Artwork.
  - 7. Provide all anchorage, mounting, and installation devices and materials, hardware, and trim for Artwork as specified below, or as otherwise necessary to complete installation of the Artwork.
  - 8. Replace and reinstall any and all defective installations by Principal Project Company of Artworks, to be determined by the Arts Commission.
  - 9. Be responsible for cost of repair and replacement solely by the original Artist of any Artwork elements that are broken or damaged by Principal Project Company from the moment the Principal Project Company takes possession of the Artwork, during handling, unpacking, storage, transporting and installation, and until acceptance by the Arts Commission or Final Acceptance, whichever comes first.
- E. Arts Commission Responsibilities. The Arts Commission will:
  - 1. For Glass Artwork:
    - a. Deliver digital production files of Artwork for glass fabrication.
    - b. Communicate sampling process with Artist.

2. For Tile Artwork:
  - a. Fabricate and deliver Artwork in a timely manner to a predetermined storage location for Principal Project Company acceptance, storage and installation with related construction.
3. Coordinate shop drawing review comments from the Artist to the City's Authorized Representative and Principal Project Company.
4. Conduct joint inspection of Artwork with Principal Project Company upon delivery of Artwork to storage location.
5. Coordinate with Principal Project Company for the time of delivery and method of transporting Artwork, storage, and supervision for installation of each Artwork item.
6. Review and approve installation of each Artwork as installation is completed by Principal Project Company.
7. Coordinate communication between Principal Project Company and Artist, and between Principal Project Company and other fabricators of Artwork.

## **1.7 PROJECT CONDITIONS**

- A. *[Left intentionally blank]*

## **1.8 QUALITY ASSURANCE**

- A. Pre-Installation Conferences(s): Principal Project Company shall schedule pre-installation meeting(s) with the City's Authorized Representative, Public Art Project Manager, Artist (if necessary), and appropriate members from the DB Contractor to coordinate and review details, schedules and responsibilities for the Work described in this Section.
- B. The coordination and installation Work described in this section is integral with the Artwork. This work will be held to close scrutiny by the Arts Commission. The Principal Project Company shall hire qualified workers with demonstrable experience in handling, protection, and installation of glass, tile, and other materials used in the Artwork and shall ensure that such workers and materials meet the applicable qualifications set forth in clauses (C) and (D) below.
- C. Glass Artwork Manufacturer Qualifications:
  1. Manufacturer shall have experience sufficient to demonstrate at least 15 Artwork projects of similar size with digitally printed images on glass used at exterior locations.
  2. Manufacturer of Artwork glass shall be capable of providing digitally printed inks on the same surface as low-E coatings.
  3. All fabrication of glass, including cutting, drilling, grinding, and notching, shall be completed prior to application of artwork.
  4. Digitally printed glass shall be viewed from 5 feet under natural daylight conditions for inspection of image quality.
    - a. Defects such as pinholes, fisheyes, perceived color variation, and/or streaks shall not be acceptable when observable at 5 feet or more.

- b. Image variation including off-parallel, missing, or shift images shall not be acceptable when observable at a distance of 5 feet. Image variation along the edges of the glass are not acceptable if they occur more than 1/8" from edge of glass.

D. Installer of Artwork Qualifications:

1. Installer shall have at least 5 years demonstrable experience in installation of similar artworks of types, materials, and sizes to be installed for this Project and shall be acceptable to the Arts Commission. Experience shall be documented in the form of a list of five (5) relevant completed projects with contact information for project references and a resume.
2. Installer must demonstrate experience in handling finely crafted elements, evidence of service orientation, capability of meeting close tolerances, and ability to work with the Arts Commission and Artists who will oversee and supervise the installation of the Artwork.

E. Mock-ups:

1. For glass Artwork panels, Principal Project Company shall provide three full size mock-ups as will be discussed/confirmed at the pre-production meeting. Final location of the mockups will be as approved by the SFAC Public Art Project Manager. The mock-ups shall be a complete installation to illustrate the interface between Artwork and joints between glass panels, including applicable sealants and lighting as indicated on the drawings or required by the specifications. Once approved, the full size in place mock-ups will be used as the standard for the subsequent installation quality of all glass panels for Artwork.
2. For two-dimensional wall mounted tile artwork, Principal Project Company shall install at least a 4'-0" x 4'-0" area on each wall to receive artwork. Installed samples are to serve as a mock-up for review and approval by the Arts Commission, Artist, and Principal Project Company for the installation workmanship, spacing and visual effect.
3. Each such mock-up, if approved by the Arts Commission and the City's Authorized Representative, shall be the standard for installation of all art elements of the same type and may be incorporated in the final installation.
4. If any mock-up is not approved by the Arts Commission and the City's Authorized Representative, Principal Project Company shall remove rejected mock-ups and create new mock-ups for review until approval is provided.

**1.9 DELIVERY, STORAGE, AND HANDLING**

- A. Principal Project Company shall receive, inspect, store, transport and handle Artwork and installation components with extreme care; and shall provide protective wrapping and padding as requested by the Arts Commission, and as otherwise required, until Artwork installation is completed.

**1.10 WARRANTY**

- A. Principal Project Company shall provide a 5-year warranty for all labor and materials related to the installation of all Artwork.

## **PART 2 - PRODUCTS**

### **2.1 ARTISTS AND ARTWORK**

- A. The Principal Project Company shall communicate solely with the Arts Commission through the Public Art Project Manager for all matters related to the Project installation schedule, delivery, storage, handling, actual installation, protection, and all other considerations related to the Artwork.
- B. The Principal Project Company shall not contact any Artist directly without prior written authorization from the Public Art Project Manager.

### **2.2 INSTALLATION MATERIALS AND COMPONENTS**

- A. All setting materials, grout, sealants, metal connections, anchors and fasteners and accessories shall be specified in shop drawings by Principal Project Company
- B. Colors for exposed items and materials will be selected by the Public Art Project Manager from manufacturer's custom colors.
- C. Metal Connections, anchors and fasteners for glass Artwork shall:
  - 1. provide for expansion and contraction of artwork and substrate caused by a temperature range of 120 degrees F over a 12-hour period without detrimental effect to artwork, substrate, or supports.
  - 2. support loads imposed by Artwork and to bridge variations in wall construction.

## **PART 2 - EXECUTION**

### **2.3 EXAMINATION**

- A. Project Principal Company shall verify that surfaces, supporting structures, materials, and locations to receive Artwork have been reviewed and approved by the Public Art Project Manager and Arts Commission prior to installation of Artwork. If the Public Art Project Manager and Arts Commission determine that unsatisfactory conditions exist, Principal Project Company shall not commence installation until such conditions have been corrected.
- B. Project Principal Company shall verify that field measurements are as shown on reviewed and SFAC-approved shop drawings.
- C. Project Principal Company shall verify that staging area is of appropriate size and configuration for delivery and unloading of Artworks.
- D. Project Principal Company shall verify that the delivery access from street level to the designated art locations is of the appropriate size, configuration and handling for delivery and unloading of Artworks.

### **2.4 INSTALLATION**

- A. Project Principal Company shall (i) provide a minimum of one month notice to SFAC and Artist prior to the actual start date of Artwork installation and (ii) show notice date in the Principal Project Company's Project Schedule as a milestone.
- B. Principal Project Company is responsible for installing the Artwork in accordance with the requirements in the specification and as indicated in the Final Design Documents.

- C. Principal Project Company shall be responsible for coordinating and implementing the work as required for the SFAC and the Artist as indicated in the Final Design Documents.
- D. Project Principal Company shall protect the Artworks per approved installation plan.
- E. At Substantial Completion, Project Principal Company shall (i) remove protective coverings only when directed by the Public Art Project Manager; and (ii) clean the Artwork, along with related setting materials and support or attachment devices to the satisfaction of the Public Art Project Manager and Arts Commission.

## **2.5 ACCEPTANCE OF ARTWORK BY CITY**

- A. The Public Art Project Manager will inspect and document Artwork upon completion of the Artwork installation.
- B. The Public Art Project Manager and Arts Commission will approve or reject the condition of the Artwork upon notice of Substantial Completion as part of the Final Acceptance procedures.

## **2.6 ACCEPTANCE OF ARTWORK BY PRINCIPAL PROJECT COMPANY**

- A. Project Principal Company shall provide Risk of Loss insurance for the Artwork.
- B. Upon acceptance of Artwork by the Public Art Project Manager and Arts Commission, Project Principal Company shall protect Artwork in accordance with corresponding, approved Submittals.
- C. Project Principal Company shall pay costs associated with the correction of any damage to Artwork caused during construction. Principal Project Company shall make repairs to Artwork to the satisfaction of the Arts Commission and the Artist.

## **2.7 PROTECTION OF ARTWORK BY PRINCIPAL PROJECT COMPANY**

- A. Project Principal Company shall protect Artworks from damage during and after installation and damage from adjacent construction work. Protection includes but is not limited to non-staining, non-adhesive protective coverings, temporary equipment and other materials.
- B. Project Principal Company shall remove coverings at time of Substantial Completion.
- C. Principal Project Company shall be responsible for damages resulting from mishandling or inadequate protection until Art Commission approval or Final Acceptance, whichever is earlier. Damaged Artwork shall be repaired or replaced at the Principal Project Company's expense.

## **2.8 CLEANING**

- A. Immediately prior to Substantial Completion, Project Principal Company shall remove coverings and clean Artwork, along with related setting materials and support/attachment devices, in a manner acceptable and under the supervision of the Public Art Project Manager and Arts Commission. Project Principal Company shall coordinate a test area with the Public Art Project Manager and clean the test area before proceeding with the rest of the Artwork. Project Principal Company shall ensure that installed Artwork is free of dust, debris, and foreign matter.

## **PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## SECTION 01 31 33 - PARTNERING PROCEDURES

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. This specification sets forth the requirements for the City and Principal Project Company to establish a collaborative partnering process for the Project. The partnering process will assist the Parties to develop a collaborative environment so communication, coordination, and cooperation are the norm, and to encourage resolution of conflicts at the lowest responsible management level.
- B. The partnering process is not intended to have any legal significance or to be construed as denoting a legal relationship of agency, partnership, or joint venture between the City and Principal Project Company.
- C. This specification does not supersede or modify any other provisions of this Agreement, nor does it reduce or change the respective rights and duties of the Parties under this Agreement, or supersede contractual procedures for the resolution of disputes, including the submittal of a timely Notice of Contract Dispute.

#### 1.2 DEFINITIONS

Unless specifically defined in this specification, all capitalized terms have the same meaning as defined in Exhibit 1 (Abbreviations and Definitions) of this Agreement.

- A. Executive Team: Senior leaders from both the City and Principal Project Company organizations responsible for steering the Project to success. The Executive Team may function as the Project's board of directors.
- B. Project Team: Key members of the City and Principal Project Company responsible for managing, implementing, and executing the Project, and who will participate in the partnering process.
- C. Stakeholders: Any third party with a vested interest in the Project's outcome. Examples include end users, neighbors, vendors, and regulatory and funding agencies.

#### 1.3 PURPOSE/GOALS

- A. The goals of project partnering are to:
  - 1. use early and regular communication with involved parties;
  - 2. establish and maintain a relationship of shared trust, equity and commitment;
  - 3. identify, quantify, and support attainment of mutual goals;
  - 4. develop strategies for using risk management concepts and identify potential project efficiencies;
  - 5. implement timely communication and decision-making;
  - 6. resolve potential problems at the lowest possible level to avoid negative impacts;
  - 7. hold periodic workshops to maintain the benefits of a partnered relationship;

8. establish periodic joint evaluations of the partnering process and attainment of mutual goals.

#### 1.4 COSTS

- A. Each party shall bear 50% of the costs of the partnering process set forth in this Section. No mark-up, overhead or other fees shall be added to the partnering costs. If the Principal Project Company fails or refuses to pay the facilitator invoices, the City may pay such invoices and deduct the Principal Project Company's portion from any amount that is due or may become due under the Agreement.
- B. The fees and expenses of the facilitator, partnering training and workshop site costs, if any, shall be paid for by Principal Project Company.
- C. Principal Project Company shall pay the invoices of the facilitator and/or workshop site costs after approval by both Parties and may seek reimbursement for City's share on its invoices.

### PART 2 - PRODUCTS (NOT USED)

### PART 3 - EXECUTION

#### 3.1 PARTNERING INITIATION

- A. No later than 60 days following NTP 1, Principal Project Company shall send the City a written invitation to enter into a partnering relationship for the Project.

#### 3.2 PARTNERING ELEMENTS

- A. At minimum, the Parties shall incorporate into the partnering relationship the following elements:
  1. **Executive Sponsorship.** A commitment from the Executive Team to support and participate in the partnering process.
  2. **Collaborative Partnering.** A structured and scalable process made up of elements that develop and grow a culture (i.e., value system) of trust between the Parties. Together, the combination of elements including the partnering charter, executive sponsorship, partnering workshops, accountability tools for the Project Team, and the facilitator create a collaborative atmosphere on the project.
  3. **Facilitator.** The Parties shall select a professional neutral facilitator according to the process described in Section 3.3, below, to lead workshops.
  4. **Partnering Charter and/or mission statement.** The Parties shall create a partnering charter that is the guiding focus for the Project Team. It shall document the Project Team's vision and commitment to work openly and cooperatively together toward mutual success during the Term. The partnering charter helps to maintain accountability and clarity of agreements made and allows for broader communication of the Project Team's distinct goals and partnering process. At minimum, the partnering charter must include the following elements:
    - a. Mutual goals, including, at minimum, core goals related to the Project's schedule, budget, quality, and safety.
    - b. Partnering maintenance plan that describes the frequency of partnering sessions, described in [Section 3.2.A.7], below.

- c. Dispute resolution plan that includes an Issue Resolution Ladder, described in [Section 3.2.A.6], below.
  - d. Team commitment statement and signatures.
5. **Partnering Workshops.** The Parties shall hold the following partnering workshops:
- a. **Kick-off Partnering Workshop.** The Parties shall hold a kick-off partnering workshop to mutually develop the framework for a successful partnering process. During the kick-off partnering workshop the Parties shall: (i) identify the members of the Project Team, Executive Team, and initial Stakeholders; (ii) draft a partnering charter and its components, described in [Section 3.2.A.4], above; (v) determine the locations for partnering workshops; and (vi) address other administrative details, as necessary.
  - b. **Project Team Partnering Workshops.** The Parties shall hold regularly scheduled partnering workshops for the Project Team as determined in the kick-off partnering workshop. Each workshop is a formalized meeting focused on developing a collaborative culture among the Project Team. The Project Team may use these workshops to set goals or commitments for the Project, attend joint training sessions, and perform other tasks. These partnering workshops are intended for the Project Team, though other partnering participants may attend as needed depending on the subject matter. Quarterly workshops are recommended.
  - c. **Executive Team Partnering Workshops.** The Parties shall hold partnering workshops or sessions for the Executive Team as determined in the kick-off partnering workshop.
6. Stakeholder Participation
- a. If the Parties mutually agree, they may hold partnering workshops or sessions where they invite Stakeholders. The purpose of these workshops or sessions is that they be conducted as listening sessions where Stakeholders provide input. Frequency shall be as determined in the kick-off partnering workshop. Bi-annually workshops are recommended.
7. **Issue Resolution Ladder:** The Parties shall mutually develop a stepped process that structures informal, project-level negotiations between the Parties to addresses issues or disputes (“Issue Resolution Ladder”). The intent of this Issue Resolution Ladder is to provide a process that quickly elevates issues or disputes up the chain of command between the Parties before they proceed to mediation. The objective is to resolve issues or disputes at the lowest practical level and to not allow individual project issues to disrupt project momentum. When an issue or dispute is escalated one level, it is expected that a special meeting focusing on the negotiated settlement for that issue will be called with the goal of settling as quickly as possible.

Sample Issue Resolution Ladder			
Team Level	City Department	Principal Project Company	Time to Elevate
1	Project Manager	Project Manager	2 weeks
2	Project Director	Project Director	2 weeks
3	Division Manager	CEO	2 weeks

4	Deputy Department Director	Equity Member's Project Principal	2 week
---	----------------------------	-----------------------------------	--------

8. Project Survey:
  - a. The Parties shall participate in periodic partnering evaluation surveys to measure progress on mutual goals and short-term key issues as they arise.

### 3.3 SELECTION OF A FACILITATOR

- A. **No later than 90 days** after NTP1 the Parties shall meet to mutually select a professional neutral facilitator for the Project in time to schedule and lead the kick-off partnering workshop. The facilitator shall lead other, follow-up partnering workshops and, if necessary or required, additional sessions.
- B. The qualifications for the facilitator are, as follows:
  1. The facilitator shall be trained in the recognized principles of partnering;
  2. The facilitator shall have at least three years' experience in providing partnering facilitation services for public-sector construction projects;
  3. The facilitator shall have experience in construction management, negotiations, labor-management mediation, and/or human relations; and
- C. The City, Principal Project Company, and the selected facilitator shall execute a third-party facilitator agreement. This agreement shall establish a budget for fees and expenses of the facilitator, workshop site costs, if any, and the terms of the facilitator's role consistent with the requirements of this specification.
- D. The facilitator shall be evaluated by the Project Team: (i) at the end of the kick-off partnering workshop; and (ii) at the close-out partnering session.
- E. If either the City or Principal Project Company is not satisfied by the services provided by the facilitator, a new and mutually acceptable facilitator shall be chosen in a reasonable amount of time and a new agreement shall be executed by Principal Project Company and the new Professional Neutral Facilitator pursuant to [Paragraph 3.3.C].

### 3.4 FACILITATOR QUALIFICATIONS AND REQUIREMENTS; EVALUATIONS

- A. The facilitator shall be trained in the recognized principles of partnering.
- B. The facilitator shall have the following professional experience and qualifications:
  1. At least 3 years' experience in partnering facilitation with a demonstrated track record, including public sector construction for a city or other municipal agency; and,
  2. Skill set that may include construction management, negotiations, labor management mediation, and/or human relations.
- C. The facilitator shall be evaluated by the partnering team: (1) at the end of the kick-off partnering workshop; and (2) at the project close-out partnering session.

**END OF SECTION**

## **SECTION 01 32 33 - PHOTOGRAPHIC DOCUMENTATION**

### **PART 1 - GENERAL**

#### **1.1 SUMMARY**

- A. General: This Section specifies administrative and procedural requirements for the submittal of pre-construction and construction photographs.

#### **1.2 SUBMITTALS**

- A. General: All submitted photos will be kept by the City and will not be returned.
  - 1. Pre-construction photographs: Project Principal Company shall submit pre-construction photographs in digital format as a condition precedent to NTP 2. Photos shall survey the Project Site with enough detail to show the conditions of the Project Site and adjacent buildings (exteriors and interiors) before the start of the D&C Work. PPC shall provide photographs from both the exterior of the building as well as the interior spaces.
    - a. Photographs shall be individually labeled using numbering or lettering that identifies the location on a site plan and floor plans as well as a roof plan, see additional requirements below.
  - 2. Construction Photographs: Project Principal Company shall submit construction photographs as described herein.
- B. Format: Unless otherwise directed by the City, Project Principal Company shall submit photographs in digital format as high resolution images showing the date and time photographs were taken, transmitted on a CD, DVD, USB drive, or other medium as acceptable to the City.

### **PART 2 - PRODUCTS**

#### **2.1 PHOTOGRAPHIC MEDIA**

- A. Digital Images: Project Principal Company shall provide images in uncompressed TIFF or JPEG format, produced by a digital camera with a minimum sensor size of 10.0 megapixels and at an image resolution of not less than 3072 by 2304 pixels. The City will have all rights as owner of all photographs, including unrestricted use of and right to publish images.

### **PART 3 - EXECUTION**

#### **3.1 PHOTOGRAPHIC REQUIREMENTS**

- A. General: Project Principal Company shall take photographs using the maximum range of depth of field and that are in focus to clearly show the D&C Work. Photographs with blurry or out of focus areas will not be accepted.
  - 1. Project Principal Company shall maintain a key plan with each set of construction photographs that identifies each photographic location.

B. Construction Photographs

1. Frequency: Project Principal Company shall take photographs as necessary to show progress of D&C Work, as a minimum coinciding with the 1st and 15th days of every month.
2. Project Principal Company shall take photos, including those for each bid item, showing different areas of D&C Work in progress. Photographs shall be taken such that the item or location being photographed shall be determinable from within the set of photographs.
3. Project Principal Company shall provide a location plan indicating the viewpoint from which the above-described photographs were taken and what they were taken of for each photograph. When possible, Project Principal Company shall take the photographs from the same location to provide a history of the progression of the Work.

C. Completion Photographs

1. Project Principal Company shall take photographs of each major phase or component of the D&C Work, as requested by the City and at a minimum at both Substantial Completion and Final Acceptance. Each major phase shall be established and identified in the Project Schedule.

D. Additional Photographs: The City may issue requests for additional photographs, in addition to the periodic photographs required to be submitted in accordance with this Section 01 32 33.

1. The City will provide PPC with three-Day's Notice of the requirement for additional photographs.
2. Circumstances that could require additional photographs include:
  - a. The City's request for special publicity photographs.
  - b. Special events planned at the Project Site.
  - c. Immediate follow-up when on-site events result in construction damage or losses.
  - d. Extra record photographs after Final Acceptance.

**END OF SECTION**

## SECTION 01 35 43 - ENVIRONMENTAL PROCEDURES

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. This Section includes:
1. General Construction Best Management Practices
  2. Stockpile Management Best Management Practices
  3. Dust Control Best Management Practices
  4. Standard Stormwater Best Management Practices
  5. Spill and Leak Control Best Management Practices
  6. Emissions-Control Best Management Practices
  7. Construction Noise Control Best Management Practices
  8. Naturally Occurring Asbestos (NOA)
  9. Asbestos Dust Mitigation Plan
  10. Night Work
  11. Environmentally Sensitive Area (ESA)
  12. Bird Protection
  13. Bat Protection (Not Applicable)
  14. Tree Protection
  15. Project Site Restoration
  16. NOT USED
  17. Human Remains
  18. Archeological Resource Protection
  19. Historical Cultural Resource Protection
  20. San Francisco Environmental Code Clean Construction Requirements for Work in an Air Pollutant Exposure Zone (APEZ)
  21. Construction Project Site Runoff Control Permit
  22. Storm Water Pollution Prevention Plan (Not Applicable)
  23. Water Quality Permitting
  24. Emergency or Backup Diesel Generator Health Risk Reduction Plan
  25. Fixed Mechanical Equipment Noise Control for Building Operations

26. Design Measures to Reduce Project Specific Wind Impacts

B. Plan Information Related to This Section

The following supplemental information shall be shown on the Design Documents:

1. Air Pollution Exposure Zone (APEZ) extent (see Article 3.20 of this section)
2. Areas within an MS4 within the jurisdiction of the Port of San Francisco (see Article 3.04 of this section)
3. Environmentally Sensitive Area (ESA) - Archaeological Monitoring Required for Ground Disturbance (see Article 3.18 of this section)
4. ESA - Biology/Other (see Article 3.11 of this section)
5. Disturbed areas whose surface is not otherwise converted to gravel, to pavement, to new landscaping as indicated on plans, or to new facilities (see Article 3.15 of this section)
6. Existing historic material in right-of-way, including granite curb (see Article 3.19 of this section)
7. Limits of mapped naturally occurring asbestos (see Article 3.05 and 3.06 of this section)
8. Species of trees to be removed or pruned (see Article 3.14 of this section)

### 1.3 DEFINITIONS

- A. Air Pollutant Exposure Zone: A zone having a substantially greater than average concentration of air pollutants as defined in San Francisco Health Code Section 3804.
- B. ALERT sheet: Single-page flyer produced by the San Francisco Planning Department and provided to Principal Project Company, containing a notification that the project site may be located in an archaeologically sensitive area.
- C. Alternative Fuels: Any transportation fuel that is less polluting than gasoline or petroleum diesel fuel, as determined by the California Air Resource Board and that is shown to have lower lifecycle carbon emissions than gasoline or petroleum diesel. Alternative Fuels may include but are not limited to natural gas; propane; biofuels from low carbon, sustainable and preferably local sources; hydrogen.
- D. Alternative Sources of Power: Utility-based electric power or other power sources other than diesel engines.
- E. CARB: The California Air Resources Board.
- F. Archaeological resources: Remains of past human activity, including historic and prehistoric material such as tools and tool fragments, hearth and food remains, structural remains, and human remains.
- G. Bridge: A structure that carries a utility or railroad or vehicle, pedestrian, or other traffic over, under, or around obstructions or waterways.
- H. Building: A building as defined in the San Francisco Planning Code Section 102, Definitions.
- I. CDFW: The California Department of Fish and Wildlife.
- J. (Not used).
- K. Clean Construction: The performance of all Construction Work required to be performed in the Contract Documents meeting the requirements in Sections 2504, 2505 and 2506 of the Environment Code, as applicable.
- L. Construction Activities: The performance of all Construction Work, except for the issuance or obtaining of a site permit.
- M. (Not Used).
- N. Construction Phase: A particular construction activity over a certain period of time. Construction Phases may include demolition, site preparation, grading, building construction, architectural coatings, and paving. Multiple Construction Phases of a single project may take place at the same time.
- O. SFDPH: The San Francisco Department of Public Health.
- P. Environmentally Sensitive Area (ESA): Area within or near construction limits where access is prohibited or limited in order to protect environmental resources. An ESA – Biology is an ESA established to protect biological resources.

- Q. Equipment Type: A category of off-road equipment (movable equipment not approved for driving on highways). Types of off-road equipment include bore/drill rigs, cranes, crawler tractors, excavators, graders, off-highway tractors, off-highway trucks, other construction equipment, pavers, paving equipment, rollers, rough terrain forklifts, rubber-tired dozers, rubber-tired loaders, scrapers, skid steer loaders, surfacing equipment, tractors/loaders/backhoes, and trenchers.
- R. Erosion and Sediment Control Plan (ESCP): A site-specific plan that details the use, location and emplacement of sediment and erosion control devices.
- S. Feasible: When applied to an action required of Principal Project Company, that action can be accomplished without resorting to extraordinary means and measures.
- T. Ground surface: The top of existing soil or the level of the finished grade of a facility, sidewalk, or roadway.
- U. Historic buildings, historic structures, and other historic resources: Buildings, structures, or other resources labeled as historic structures on Design Documents or in Reference Documents.
- V. Inactive nests: Nests that do not contain eggs, chicks, or raptors displaying reproductive behavior.
- W. In-Water Work: Work to be conducted below Mean Higher High Water (MHHW) lines as defined by the National Oceanic and Atmospheric Administration.
- X. Land disturbance: Any movement of earth or a change in the existing natural soil cover or existing topography that may result in soil erosion from wind, or water, and the moving of sediments into or upon waters, lands or public rights-of-way within the City and County of San Francisco, including, but not limited to building demolition, clearing, grading, grubbing, filling, stockpiling, excavating and transporting over land.
- Y. Major Construction Project: A public work to be performed within the geographic limits of the City and County of San Francisco that uses off-road equipment and that is estimated to require 20 or more cumulative days of work, including non-consecutive days, to complete.
- Z. Most Effective Verified Diesel Emission Control Strategy (VDECS): a device, system or strategy that is verified, pursuant to Division 3, Chapter 14, of Title 13 of the California Code of Regulations, to achieve the highest available level of pollution control.
- AA. Nesting Season: The City Planning Department anticipates nesting or attempted nesting by migratory and non-game birds from February 15 to August 31.
- BB. Off-Road Engine: A non-road engine as defined in Title 40 of the Code of Federal Regulations, Section 89.2.
- CC. Off-Road Equipment: Equipment with an off-road engine having greater than 25 horsepower and operating for more than 20 total hours over the entire duration of Construction Activities.
- DD. On-Road Equipment: A heavy-duty vehicle as defined in Title 40 of the Code of Federal Regulations, Section 86.1803-01.
- EE. Paleontological resources: Fossils and the deposits in which they are found. Fossils are evidence of ancient life preserved in sediments and rock. Examples of paleontological resources are the remains of (1) animals, (2) animal tracks, (3) plants, and (4) other organisms. Archaeological resources are not paleontological resources. Fossils found within an archaeological resource are generally considered archaeological not paleontological resources.

- FF. PAR: Pedestrian access route as defined in the ADA and ABA Accessibility Guidelines for the Public Right-of-Way (An accessible, continuous, and unobstructed path of travel for use by pedestrians with disabilities within a pedestrian circulation path).
- GG. Plant species that may harbor *Phytophthora*: The City Planning Department considers host species to include: Coast Live Oak (*Quercus agrifolia*), Canyon Live Oak (*Quercus chrysolepis*), California Black Oak (*Quercus kelloggii*), Shreve's Oak (*Quercus parvula* var. *shrevei*), Tanoak (*Notholithocarpus densiflorus*), California bay laurel (*Umbellularia californica*).
- HH. Portable Diesel Engine: A diesel engine that is portable as defined in 71 California Code of Regulations, Section 93116.2(bb).
- II. Property line: The line at the ground surface at which the public right-of-way adjoins a platted parcel.
- JJ. Rain event: A rain event is a forecast for the project area by the National Weather Service of a 50 percent chance of occurrence within the following 72 hours of an amount of precipitation of 0.50 inch or greater.
- KK. Regulated Species: Species protected by one or a combination of the following:
1. Federal Endangered Species Act of 1973, 16 USC§ 1531 et seq.
  2. California Endangered Species Act, Fish & Game Code§§ 2050-2115.5
  3. Fish & Game Code§§ 1600-1616
  4. National Environmental Policy Act, 42 USC§ 4321 et seq.
  5. California Environmental Quality Act, Pub Res Code§ 21000 et seq.
  6. Other law or regulation governing activities that affect species or their habitats.
- LL. Routine Biological Activities: Biological monitoring, surveying, or other activity that does not require a take permit from the US Fish and Wildlife Service or National Oceanic and Atmospheric Administration (NOAA) Fisheries or a take permit or memorandum of understanding from the California Department of Fish and Wildlife.
- MM. Sensitive receptor (air quality): Residence, school, childcare center, hospital or other health-care facility or group living quarters.
- NN. Sensitive Use: A category of building use identified as a Sensitive Use in Health Code Section 3804.
- OO. Sensitive receptor (noise): Any environment listed in Guidelines for Community Noise - A complete, authoritative guide on the effects of noise pollution on health (World Health Organization, Geneva, 1999). Table 4.1, for which the recommended noise levels are low, as low as possible, or a maximum LAeq[dB] <70. These include:
1. Outdoor living areas
  2. Dwellings, indoors
  3. Inside bedrooms
  4. Outside bedrooms (window open)
  5. School classrooms and pre-schools, indoors

- 6. Pre-school bedrooms, indoors
  - 7. School, playground outdoor
  - 8. Hospital, ward rooms, indoors
  - 9. Hospitals, treatment rooms, indoors
  - 10. Outdoors in parkland and conservation areas
- PP. Service-Approved Biologist: Biologist whose activities must be approved by a state or federal agency as provided in applicable permit, license, agreement, certification, or any combination of these.
- QQ. Soil: Native fill or introduced earthen fill. It does not include materials that were previously introduced as part of roadway pavement section (including asphalt concrete wearing surface, roadway base, and subbase).
- RR. Stormwater Pollution Prevention Plan (SWPPP): A detailed plan that identifies potential sources of stormwater pollution, describes the practices that will be used to prevent stormwater pollution, and identifies procedures the operator will implement to comply with all requirements in the construction general permit.
- SS. Take: Legal definition regarding harm to protected species as defined in 16 USC § 1532 and California Fish & Game Code § 86.
- TT. Tier 2 Off-Road Emission Standards: The Tier 2 new engine emission standards in Title 13, California Code of Regulations, Section 2423(b)(1)(A) and/or Title 40, Code of Federal Regulations, Part 89.112(a).
- UU. Unique Archaeological Resource is as defined in the California Environmental Quality Act statute at § 21083.2.
- VV. VDECS: A verified diesel emission control strategy, designed primarily for the reduction of diesel particulate matter emissions, which has been verified by ARB pursuant to Verification Procedures, Warranty and In-Use Strategies to Control Emissions from Diesel Engines, Title 13, California Code of Regulations, Sections 2700-2710. VDECS can be verified to achieve Level 1 diesel particulate matter reductions (at least 25 percent), Level 2 diesel particulate matter reductions (at least 50 percent), or Level 3 diesel particulate matter reductions (at least 85 percent).
- WW. Visible dust: Dust comprising visible emissions as defined in Bay Area Air Quality Management Board Regulation 6 – Particulate Matter.

#### **1.4 SUBMITTALS**

- A. Principal Project Company shall submit the following to City prior to mobilization, or as otherwise stated herein:
- 1. The following plans and permits, with Regulatory Agency approvals wherever required:
    - a. Pre-construction survey for nesting birds that may be affected during construction work. (see Article 3.12 of this section)
    - b. Photographs of existing landscaping at the limit-of-work line(s). (see Article 3.14 of this section)

- c. Tree protection fence locations and stake placement provided at least two weeks in advance of the date for any on-site review of the fence and stake placement. (see Article 3.14 of this section)
- d. Written and/or photographic documentation of methods for avoidance of Environmentally Sensitive Areas. (see Article 3.11 of this section)
- e. A copy of written notice, accompanied by proof of submittal, provided to the Bay Area Air Quality Management District in accordance with the requirement of the "Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations," in advance of roadway construction and maintenance activities in areas soils containing naturally occurring asbestos. (see Article 3.08 of this section)
- f. Prior to issuance of construction permits, and prior to commencement of each construction stage, a Project-specific construction noise control plan shall be reviewed and approved by City Planning Department and City. (see Article 3.07 of this section)
- g. Prior to issuance of construction permits, Principal Project Company's construction emissions minimization plan (CEMP) shall be reviewed and approved by City Planning Department and City. (see Article 3.06 and 3.20 of this section for CEMP plan requirements)
- h. Principal Project Company's initial dust control plan (DCP). (see Article 3.03 of this section)
- i. SFDPH Permit and notification for removal and installation of fuel or chemical storage tanks (see Article 3.23 of this section)
- j. SFDPH Well Construction/Decommissioning or Soil Borings Permit (see Article 3.23 of this section)
- k. Finalized Asbestos Dust Mitigation Plan approved by BAAQMD (see Article 3.09 of this section)
- l. Prior to issuance of construction permits, and prior to commencement of each construction stage, a Noise Control Plan shall be reviewed and approved by City Planning Department and City (see Article 3.07 of this section)
- m. San Francisco Public Works Night-Noise Permit (see Article 3.10 of this section)
- n. Prior to issuance of a construction permit, an Archeological Monitoring Plan shall be reviewed and approved by City Planning Department.
- o. The issued Construction Project Site Runoff Control Permit for the project from the SFPUC with written and schematic summary of details. (see Article 3.21 of this section)
- p. The issued WDID for the Stormwater Pollution Prevention Plan (SWPPP) from the Regional Water Quality Control Board with certified SWPPP inspection checklist. (see Article 3.22 of this section)
- q. (Not Used)
- r. Underground Storage Tank (UST) Permit (see Article 3.23 of this section)

- s. Well Construction/Decommissioning or Soil Borings Permit (see Article 3.23 of this section)
2. For the subject matter expert specialist services required to be retained and provided by Principal Project Company to perform work in this Section, submit qualifications for the following firms and persons specified in this Section to demonstrate their capabilities and experience to ensure full compliance with this Section:
- a. Qualified Acoustical Consultant: A Board-Certified Institute of Noise Control Engineering (INCE) member or other qualified consultant or engineer approved by City.
  - b. Qualified Arborist: The Qualified Arborist who possesses a professional certification from the International Society of Arboriculture, and/or possesses a valid C-27 and/or a C-61/D-49 license in the State of California.
  - c. Specialty Environmental Monitor – archaeologist: One who in the determination of City is qualified to monitor land-disturbing activities for effects to buried archaeological resources.
  - d. Qualified Biologist is one whose activities must be approved by a State or federal agency as provided in the applicable permit, license, agreement, certification, or any combination of these. In the event that none of these apply, the biologist must possess at a minimum a bachelor's degree in Wildlife Biology or a closely related discipline, as approved by City.
  - e. Qualified Historic Architect or Historic Preservation Professional: Any consultant within the "Historic Resource Consultant Pool" as established by the San Francisco Planning Department.
  - f. Qualified SWPPP Practitioner (QSP): Individual who is authorized by the State Water Resources Control Board (SWRCB) to develop and revise Stormwater Pollution Prevention Plans. The QSP will have prepared a minimum of five (5) SWPPPs, including at least two (2) SWPPPs for Risk Level 2 and/or LUP Type 2. All five (5) SWPPPs will be available on SMARTS and to document these QSD qualifications. The QSP will have a minimum of 4 years demonstrable experience implementing SWPPPs and performing field inspections including two years on Risk Level 2 and/or LUP Type 2 projects under the General Permit. In addition to the CASQA certification, if Principal Project Company's QSP is a registered Civil Engineer, registered landscape Architect, or professional hydrologist, Principal Project Company's QSP will also possess one of the following certifications:
    - 1) A Certified Professional (and Investigator) in Erosion and Sediment Control (CPESC) registered through Enviro Cert International, Inc.
    - 2) A Certified Professional in Storm Water Quality (CPSWQ) registered through Enviro Cert International, Inc.
- B. Principal Project Company shall submit the following to City during the course of the Construction Work:
- 1. Principal Project Company shall submit the "ALERT" sheet affidavit within five business days of the start of Construction Work. (see Article 3.18 of this section)
  - 2. (Not Used)

3. Documentation of disposal in landfill or at a commercial composting facility of plant materials potentially harboring the *Phytophthora ramorum* pathogen within one week of disposal. (see Article 3.14 of this section)
  4. Certificates of Quarantine Compliance from County Agricultural Commissioner documenting that hay, straw, or mulch used on the project has been inspected and is weed free before installation of stormwater BMPs. (see Article 3.04 of this section)
  5. ESCP inspection checklists transmitted on a monthly basis (see Article 3.21/3.22 of this section)
  6. Notification(s) that Change Orders or other changes in construction conditions will alter the ESCP, and any additional modifications to the ESCP (see Article 3.21/3.22 of this section)
  7. Analytical water-quality monitoring results (see Article 3.21-3.23 of this section)
  8. Noise complaint logs (see Article 3.07 of this section).
  9. Photographic documentation of signage to be posted by the Principal Project Company as required by this section:
    - a. A sign with the telephone number and a City person to contact regarding dust complaints and the BAAQMD's phone number (see Article 3.03 of this section)
    - b. Legible and visible posted signs, in English, Spanish, and Chinese, in designated queuing areas and at the construction site to remind operators of the engine-idling limit (see Article 3.06 of this section)
    - c. Signs on-site pertaining to permitted construction days and hours and noise complaint procedures and who to notify in the event of a problem, with telephone numbers listed (see Article 3.07 of this section)
    - d. A legible and visible sign summarizing the Construction Emissions Minimization Plan (see Article 3.06 of this section)
  10. Photographic documentation of temporary fence Type ESA at the entire perimeter of ESA -- Biology as shown on the Design Documents (see Article 3.11 and 3.14 of this section).
- C. Principal Project Company shall submit to the San Francisco Planning Department after completion of construction activities and prior to receiving a final certificate of occupancy:
1. A final construction emissions minimization plan (CEMP) report summarizing construction activities, including the start and end dates and duration of each construction phase, and the specific information required in the CEMP. (see Article 3.06 of this section)

## 1.5 VIOLATIONS

- A. Principal Project Company shall be responsible for all costs incurred or necessary to ensure compliance of its operations and their performance of the Construction Work with all applicable Environmental Laws and the requirements of this section, including the following:
1. If violations of the conditions of this section result in monetary fines, these will immediately be paid by the Principal Project Company.

2. If Principal Project Company finds the Design Documents are at variance with State or Federal environmental-regulatory requirements, Principal Project Company shall give the City prompt written notice thereof and shall make the Design Documents consistent with State or Federal environmental-regulatory requirements.
  3. If violations of the conditions of this section result in fees charged by City Planning Department, state, or federal agencies to defray the costs of document processing and review, consultation with applicants, and administration of the statutory requirement, Principal Project Company shall pay the fees.
  4. Principal Project Company shall be responsible for all monetary compensation for physical damage resulting from violations of conditions of this section. If the damage is to an environmental resource, including vegetation, wildlife, natural communities, cultural resources, and water quality that is protected by Federal law (including resources subject to Federal permitting and/or subject to evaluation under the National Environmental Policy Act), State law (including resources subject to state permitting and/or to evaluation under the Environmental Quality Act), and/or City Planning Department ordinance, Principal Project Company shall pay for all costs associated with environmental assessment of the damage and the costs of mitigation as determined by each AHJ.
  5. Principal Project Company shall be responsible for all costs, including labor and material costs, for any site restoration or remediation necessary in the opinion of City to address the consequences of violations of this section.
  6. In the event that violations of this section result in civil action(s) against the City, Principal Project Company shall pay all consequent legal fees associated with the action(s) and damages assessed in the action(s) against the City.
  7. The City will provide no compensation to Principal Project Company for Project delays or work stoppages resulting from failure by Principal Project Company to comply with the terms of this section.
  8. Any costs associated with requirements for additional environmental training imposed by City will be borne exclusively by Principal Project Company.
- B. City reserves the right to require additional training, issue environmental non-compliance notices, have the necessary work performed by others at Principal Project Company's expense, assess non-compliance points or penalties, or to deduct or withhold all monies required therefore as permitted under the Contract Documents.
- C. City and the Planning Department will inspect and monitor Principal Project Company's adherence to the requirements specified herein and will report on Principal Project Company's compliance. Pursuant to California Assembly Bill 3180 (chapter 1232), the City Planning Department at its own discretion will monitor Principal Project Company's compliance with the requirements of this section. Said monitoring and reporting activities may include qualitative, quantitative and video observations and data collection on the impacts of noise, vibration air quality, traffic, street pavement damage, water quality, cultural resources, biological resources and hazardous materials.
1. Principal Project Company shall cooperate with such inspection and monitoring activities, provide access to the Work site to establish and secure monitoring stations, and make its facilities and records available to the City Planning Department for performing such monitoring.
  2. The City Planning Department will issue a Non-Compliance Notice to Principal Project Company for any detected non-compliance with the provisions herein or of any environmentally objectionable acts and the corrective action to be taken.

3. The City Planning Department will inspect and monitor Principal Project Company's adherence to the requirements specified herein and will report on Principal Project Company's compliance.
- D. If Principal Project Company uses off-road equipment and/or off-road engines in violation of the Clean Construction requirements set forth in Administrative Code Section 6.25 and Chapter 25 of the Environment Code, City will suffer actual damages that will be impractical or extremely difficult to determine. Accordingly, Principal Project Company agrees to pay City the amount of \$100 per day per each piece of off-road equipment and each off-road engine used to complete Construction Work on the Project in violation of the Ordinance. Such amount will not be considered a penalty, but rather agreed monetary damages sustained by City because of Principal Project Company's failure to comply with the Clean Construction requirements.
1. False Representations: False representations by the Principal Project Company, in connection with the bidding, execution or performance of the Agreement, regarding the nature or character of the off-road equipment and/or off-road engines to be utilized or to the City Planning Department about the nature or character of the off-road equipment and/or off-road engines actually used may subject Principal Project Company to the consequences of noncompliance specified in Section 2510 of the Environment Code, including but not limited to the penalties prescribed therein. The assessment of penalties for noncompliance will not preclude the City Planning Department from exercising any other rights or remedies to which it is entitled.
- E. Trees and plants destroyed or damaged beyond repair due to Principal Project Company's negligence, failure to provide adequate protection, or failure to perform recommended selective pruning will be compensated by Principal Project Company at no additional cost to the City.
1. Damage beyond repair that requires replacement will be determined by the Public Works Bureau of Urban Forestry.
    - a. If Principal Project Company should cause minor damage as defined by nicked tree trunks, limbs and branches or broken branches to trees or shrubs during the course of construction, Principal Project Company shall pay the following penalties at the beginning of each billing period:
      - 1) Principal Project Company shall be penalized the sum of One Hundred dollars (\$100) for the first incident which causes minor damage to trees or shrubs.
      - 2) Principal Project Company shall be penalized the sum of Two Hundred dollars (\$200) for the second incident which causes minor damage to trees or shrubs.
      - 3) Principal Project Company shall be penalized the sum of Five Hundred dollars (\$500) for the third and subsequent incidents which cause minor damage to trees or shrubs.
    - b. Principal Project Company shall replace any trees or shrubs that suffer more serious damage, including damage to roots 2-inches in diameter or larger, during construction at no additional cost to the City. The Public Works Bureau of Urban Forestry will determine the value of such replacement trees or shrubs. In addition to Principal Project Company's restoration approved by the Public Works Bureau of Urban Forestry, the Principal Project Company shall be assessed damages for the difference in the dollar value of the damaged tree or other plant material, and the dollar value of the replacement.

- c. The dollar value will be determined by the Public Works Bureau of Urban Forestry from the "Guide for Establishing Values of Trees and Other Plants," prepared by the Council of Tree and Landscape Appraisers, current edition. Damages assessed will be deducted from moneys due or that may become due to Principal Project Company.
  - d. Principal Project Company shall in addition be liable for the cost to the City for removing the damaged tree(s). This cost will cover 1.5 times the hourly wage of all person(s) at the site for the required hours to remove the tree(s) and haul offsite as directed by the Public Works Bureau of Urban Forestry.
2. Replacement will include the replacement plant material, transportation, installation, a 30-day maintenance period, and a one-year warranty.
  3. Planting location for replacements may be different from the original location and will be determined by the Public Works Bureau of Urban Forestry.
  4. Replace shrubs, ground cover and turf with plants similar in species, size and shape.
  5. Replace trees with plants of same species, size and shape.
  6. Replacements for trees of 2"-8" caliper will be replaced with similar sized plants; trees over 8" caliper will be 60" box size.
  7. Since age and size of existing tree may prohibit replacement with same size tree, the difference in caliper between size of damaged tree and replacement of tree will be compensated by Principal Project Company.
  8. Principal Project Company shall fell trees to be removed so that trees to remain are not injured.
- F. Principal Project Company is responsible for liquidated damages of \$1,600 for each day for which the presence of the Specialty Environmental Monitor – Archaeologist was requested but not cancelled within the prescribed timeframe.

## **PART 2 - PRODUCTS (NOT USED)**

## **PART 3 - EXECUTION**

### **3.1 GENERAL CONSTRUCTION BEST-MANAGEMENT PRACTICES**

- A. Principal Project Company shall maintain the Project Site and Construction Work areas under its control and adjacent public rights-of-way in a clean and orderly state, a safe condition, and remove all accumulations of debris and surplus materials at the end of each workday. Waste materials, trash, and debris are the property of the Principal Project Company.
  1. Principal Project Company shall initiate and maintain a specific daily program to prevent the accumulation of debris at the construction site, storage and staging areas, parking areas, and along streets, roads, and haul routes in the immediate vicinity of the Project Site, to include, at a minimum:
    - a. Keeping all debris, hazardous/contaminated material, surplus concrete and excavated materials off the roadway and sidewalks and out of catch basins at all times.

- b. Damp-sweeping all pedestrian walkways and dispose of debris around the site perimeter on a daily basis and as often as determined by City.
  - c. Daily inspection of traffic areas and haul routes to enforce debris and clean up requirements and daily removal of all debris from the Project Site and Construction Work areas, including haul routes, caused directly or indirectly by Principal Project Company's operations.
  - d. Ensuring that materials to be used for construction are stored in designated structures or areas by the appropriate trades. Maintain such areas or structures in a clean condition daily for the portion of the Term that commences on NTP 2 and ends on the Final Acceptance Date.
  - e. Maintaining hazardous, dangerous, or unsanitary waste materials separately from other waste by containerizing properly and dispose those types of materials in a lawful manner. Principal Project Company shall comply with requirements of NFPA 241 for removal of combustible waste material and debris.
  - f. Providing and maintaining covered containers for the deposit of debris and keep them covered.
  - g. Disposing of all food-related trash items (e.g., wrappers, cans, bottles, food scraps) in closed trash containers, which shall be emptied daily. Principal Project Company shall provide separate containers for recyclables, compostables, and landfill-bound trash. Burying or burning of trash and debris on the Project Site is not permitted.
  - h. In the event that Principal Project Company observes any rodent or insect infestation, Principal Project Company shall effectively control such infestation by the use of such poisons, gas traps, or insecticidal sprays as meet the written approval of the Director of Public Health (San Francisco Public Works Code, Article 17: Control of Dumps Disposing of Materials from Construction or Demolition, Section 858: Rodent and Insect Control) as verified by City.
  - i. Providing licensed waste material handlers to service portable sanitary facilities and trash dumpsters weekly, or more often if needed or if directed by City.
  - j. Controlling aerial deposition of site materials, including metals, nutrients, organics, sediment, other particulates, and trash.
  - k. Overseeing all cleaning of areas by trades using them and ensure that resulting accumulations are deposited in appropriate containers.
2. Principal Project Company is specifically prohibited from disposing of paint, petroleum products, dirty water, soil sterilants, concrete slurry or any other deleterious materials to soil.
  3. Principal Project Company shall maintain the Project Site, equipment, fences and signs free of graffiti. As warranted, Principal Project Company shall remove all graffiti daily, using methods which cause no damage to the Project, Construction Work or existing facilities.
  4. Principal Project Company shall locate site construction staging areas away from public view and on paved or previously disturbed areas to the extent feasible.
  5. No firearms will be allowed within the construction limits.

6. At Final Acceptance, Principal Project Company shall leave the Project Site in clean and orderly condition.

### **3.2 STOCKPILE-MANAGEMENT BEST MANAGEMENT PRACTICES**

- A. Principal Project Company shall implement the following stockpile management best management practices to ensure no visible dust and to control stormwater discharges of stockpiled material, including all erodible stockpiled construction materials and landscape materials:
  1. Locate stockpiles at a minimum of 50 yards away from concentrated flows of storm water, drainage courses and inlets.
  2. Stockpiles must be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile.
  3. Any excavated soils should be removed from the Project Site by the end of the day, if in the opinion of City, this can be accomplished without resorting to extraordinary means and measures.
  4. Stockpiles/storage piles greater than ten cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and/or soil that will remain inactive for more than seven (7) days will be covered with a 10 mil (0.01 inch) polyethylene plastic or equivalent tarp and braced it down, or use other equivalent soil stabilization techniques as approved by City.
  5. Principal Project Company shall monitor the National Weather Service forecast daily for forecasts of a rain event. When a rain event is forecasted for the Project area by the National Weather Service with at least a 50 percent chance of occurrence within the following 72 hours, Principal Project Company shall cover stockpiles with a 10 mil (0.01 inch) polyethylene plastic or equivalent tarp and brace it down.
  6. During the rainy season, Principal Project Company shall also implement the following best management practices:
    - a. Stockpiles shall be protected with a temporary linear sediment barrier berm prior to the onset of precipitation. Surround stockpiled material with fiber rolls, gravel sediment barrier, silt fence or other runoff controls as approved by the City Planning Department.
    - b. Use inlet controls such as block gravel sediment barriers when stockpiles are proximate to catchbasins. Silt fencing will be additionally installed at the foot of the slope around the entire perimeter of stockpiled soil.
    - c. Where necessary, V-ditches and silt traps/sediment traps will be installed at the perimeters of stockpiles to collect runoff to allow flow to continue to storm drain inlets.

### **3.3 DUST-CONTROL BEST MANAGEMENT PRACTICES**

- A. Principal Project Company shall ensure no visible dust is generated through construction.
  1. Principal Project Company is responsible for taking all reasonable measures to furnish all labor, equipment, and means required to carry out effective measures whenever and as often as necessary to prevent its operation from producing dust in amounts damaging to surrounding properties or causing a nuisance to businesses and local residents.

2. Principal Project Company shall post a publicly visible sign with the telephone number and person to contact at Principal Project Company regarding dust complaints. The BAAQMD's phone number will also be visible to ensure compliance with applicable regulations.
- B. Principal Project Company shall not engage in any construction or grading operation on property unless all the following dust mitigation measures are initiated at the start and maintained throughout the duration of the construction or grading activity:
1. Vehicle and equipment maintenance:
    - a. Principal Project Company shall maintain tire inflation to the manufacturers' inflation specifications.
    - b. Principal Project Company shall limit vehicle speed limit on unpaved roads to 15 miles per hour (mph), or less if required to minimize dust emissions.
    - c. Principal Project Company shall ensure that equipment, trucks and tires are washed down before moving from the active areas on to a paved public road to minimize deposition of dust-causing materials.
    - d. Principal Project Company shall load haul trucks, hauling debris, soils, sand or other such materials so that the material does not extend above the walls or back of the truck bed. Principal Project Company shall wet each load before covering and shall tightly cover the surface of each load before the haul truck leaves the loading area.
      - 1) The Principal Project Company shall cover and line the truck bed ("burrito wrap") with 10mil HDPE for all truckloads of soils containing naturally-occurring asbestos.
  2. Limitations on grinding, crushing, and ground disturbance:
    - a. Principal Project Company shall plan and execute the work in such manner as to ensure that the total of soils-disturbing construction activities never amount to one half acre of area at any one time unless otherwise directed by City.
    - b. Principal Project Company shall terminate surface excavation and grading activities when wind speeds exceed 25 miles per hour.
    - c. Principal Project Company cannot perform screening or crushing operations without the appropriate BAAQMD and Cal-EPA/DTSC permits for these activities.
  3. Principal Project Company shall ensure that all borrow areas are protected with appropriate erosion control measures to the satisfaction of City.
  4. Use of water for dust control:
    - a. Whenever feasible, Principal Project Company shall use reclaimed water for dust control activities.
    - b. Principal Project Company shall treat and amend all water for dust control with biodegradable, non-polluting, non-toxic dust control agent.
    - c. Principal Project Company shall conduct mist or spraying activity in such a way as to prevent puddling or generation of runoff.

- d. Prior to any ground disturbance, Principal Project Company shall apply enough water to the area to be disturbed to prevent visible emissions from crossing the Project Site boundaries.
  - e. Principal Project Company shall perform continuous water spraying during dust generating activities, including but not limited to demolition, excavation, and earthmoving.
  - f. Principal Project Company shall keep areas being graded or excavated wetted to the extent required to prevent visible emissions from crossing the Project Site and property line.
  - g. Principal Project Company shall wet all exposed soil surfaces at least three times daily during dry weather or more frequently if dust is blowing or if required by City.
  - h. Principal Project Company shall ensure that a water truck and/or water buffalo always is readily available at the Project Site. Localized dust controls such as water hoses shall be pre-connected to a water source or water canisters to immediately control visible dust emissions at each active work area.
  - i. Principal Project Company shall ensure that water trucks are equipped with hand-held hoses. Hoses shall be equipped with micro-misters and micro-foggers.
  - j. In wet areas, Principal Project Company shall ensure that caution signs are posted to prevent slipping hazards.
5. Principal Project Company shall provide dust control for disturbed surface areas to include one or more of the following so as to prevent dust from becoming airborne:
- a. Keeping the surface wetted so that no visible dust is produced.
  - b. Establishment and maintenance of surface crusting.
  - c. Application of chemical dust suppressants or chemical stabilizers according to the manufacturers' recommendations as needed.
  - d. Covering with tarp(s) or vegetative cover.
  - e. Installation of wind barriers across open areas.
6. Principal Project Company shall implement the following for management of excavated material and demolition debris at the Project Site:
- a. Minimize to the extent feasible the amount of excavated material or demolition wastes stored at the site.
  - b. Minimize the amount of excavated materials stored at the site.
  - c. Remove all demolition debris from the site no later than the end of each workday.
7. Principal Project Company shall clean up spillage on City streets, whether directly or indirectly caused by Principal Project Company's operations.
8. Principal Project Company shall eliminate track-out from the construction site and, at a minimum shall comply with the following:

- a. Principal Project Company shall immediately remove any visible track-out of asphalt, soil, gravel, debris and dirt from a paved public road at any location where vehicles enter and exit the site.
  - b. All visible mud or dirt track-out from areas of land disturbance onto adjacent City streets shall be removed using wet power vacuum street sweepers at least once per day.
  - c. The use of dry power sweeping is prohibited.
  - d. Principal Project Company shall install one or more of the following track-out prevention measures at all entry and exit points. These track-out controls are to be cleaned, maintained and replaced to keep their use effective for the project duration.
    - 1) A gravel pad designed using good engineering practices to clean the tires of exiting vehicles.
    - 2) A metal griddle (rumble plate) tire shaker.
    - 3) A wheel wash system.
    - 4) Pavement extending for not less than fifty (50) consecutive feet from the intersection with the paved public road; or
    - 5) Any other measure as effective as the measures listed above as approved by City.
9. Principal Project Company shall implement the following regimen of sweeping:
- a. Keep the entire site of the work and adjacent areas (including sidewalks, 500 consecutive feet in all directions of intersections, walkways and roadways) continuously free of dirt and dust by wet sweeping at least three times per shift, including at the end of the workday. Use a wet sweeping or a HEPA filter equipped vacuum device on at all entry and exit points more frequently if needed to keep free of dirt and dust.
  - b. Clean visible track-out on the paved public road using wet sweeping or a HEPA filter equipped vacuum device.
  - c. Always maintain a regenerative air or high efficiency vacuum sweeper-vehicle on the Project Site. City will evaluate the effectiveness of Principal Project Company's vacuum sweeper-vehicle and, if necessary, will require Principal Project Company to provide a more powerful and effective sweeper.
10. When directed by City, Principal Project Company shall use dust enclosures, curtains, and dust collectors to control dust.
- C. Prior to grading or excavating an approved Site-Specific Dust Control Plan (DCP) under the Dust Control Ordinance (San Francisco Health Code Article 22B) is required.
- 1. Principal Project Company shall incorporate in its Project Schedule the time it will take for the SFPDH to review and approve the DCP application and the DCP. Principal Project Company shall take into account and incorporate in its Project Schedule the time it will take to implement the provisions of the DCP.

2. Principal Project Company shall submit a completed application and pay the associated fees to the SFDPH. Principal Project Company may not commence Construction Work, demolition, excavation, grading, foundation work, or other permitted activities until Principal Project Company has submitted to City and City Planning Department a copy of SFDPH director's written approval of the DCP, the plan provisions have been implemented, and the City has subsequently given Principal Project Company permission to proceed. All provisions of the approved plan become the responsibility of the Principal Project Company.
3. Principal Project Company shall interpret as mandatory all guidance in the Department of Public Health's handout "Monitoring Guidelines for SFHC Article 22B" in the event that the Plan requires monitoring.

### **3.4 STANDARD STORMWATER BEST-MANAGEMENT PRACTICES**

- A. Unless otherwise superseded by the terms of the Erosion and Sediment Control Plan, Principal Project Company shall design, install, and maintain effective Project-specific Project Site sediment controls to minimize the discharge of pollutants utilizing site-specific BMPs. These BMPs include but are not limited to the following:
  1. Immediately initiate stabilization for disturbed areas whenever earth disturbance has permanently ceased on any portion of the site, or temporarily ceased on any portion of the site where earth disturbance will not resume for a period exceeding 14 calendar days.
  2. Principal Project Company may stabilize soil exposed soil using bonded-fiber matrices, hydromulches, spray tackifiers, or other land-applied products: Principal Project Company shall apply the product according to the manufacturer's instructions and guidance; and apply the product according to the manufacturer's guidance to allow for ample cure time and to prevent treatment chemicals from being transported by runoff.
  3. Principal Project Company may use Erosion Control Blankets to control to stabilize disturbed and exposed soil if exposed soil generates visible runoff.
- B. Principal Project Company shall install BMPs, including temporary sediment barriers, soil stabilization measures, and sediment basins, sufficient to control erosion and subsequent sediment discharges from the Project Site, at locations with potential for erosion and as otherwise directed by City. These include all exposed soils and construction site entrances and exits.
  1. Principal Project Company shall design BMPs according to the California Stormwater Quality Association's (CASQA) current Construction BMP Guidance Handbook and utilize outlet structures that withdraw water from the surface, unless infeasible.
  2. Sandbags shall be stockpiled on site and placed there at intervals as directed by City. After rain events, Principal Project Company shall check for and remove sediment trapped by sandbags at staging area. Principal Project Company shall replace sandbags if deterioration is evident.
  3. BMPs shall be relocated as necessary for construction operations, with prior written approval from City.
  4. BMPs shall be installed so as not to compromise safety of vehicles operating in roadways adjacent to erosion control BMPs.
  5. Principal Project Company shall remove the temporary BMPs when permanent measures are in place.

- C. Principal Project Company shall contain packaged landscape materials (e.g., fertilizers) when they are not being actively used, and apply erodible landscape material at quantities and rates according to manufacturer recommendations or based on written specifications by knowledgeable and experienced field personnel. Principal Project Company shall discontinue the application of any erodible landscape material at least 2 days before a forecasted precipitation event.
- D. During the rainy season, Principal Project Company shall inspect all erosion control measures daily and after each storm. Any damaged BMP shall be repaired at the close of each day and whenever rain is forecast. During the rainy season, erosion control BMPs (with the exception of sprayed products) shall be available on-site, or at a nearby location (e.g., common lay-down yard), year-round with trained persons able to deploy the product.
- E. Principal Project Company shall conduct a pre-rain-event inspection within 72 hours prior to any forecasted rain event. Precipitation forecast information shall be obtained from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at <https://www.weather.gov/>) and shall be included as part of the inspection checklist weather information. If extended forecast precipitation data (greater than three days) is available from the National Weather Service, the pre-precipitation event inspection may be done up to 120 hours in advance. During periods when storms are forecast, Principal Project Company shall:
  - 1. Inspect all stormwater drainage areas to identify leaks, spills, or uncontrolled pollutant sources and when necessary, implement appropriate corrective actions to control pollutant sources.
  - 2. Ensure that excavated soils are not be placed in streets or on paved area, and all paved areas are to be kept clear of earth material and debris.
  - 3. Remove any excavated soils from the Project Site by the end of the day if feasible.
  - 4. Clean and skim drainages and detention basins daily.
- F. Principal Project Company shall divert run-on water flowing onto the construction site from off-site areas to prevent its contributing to the construction site's stormwater. Installation of run-on diversion shall occur prior to entering an area affected by construction activity. Principal Project Company shall ensure that run-on flow diversion is conveyed through or around the construction activity in plastic pipe or an engineered conveyance channel in a manner that will not cause erosion due to flow diversion.
- G. Principal Project Company shall secure and contain concrete washout areas and other washout areas that may contain additional pollutants to prevent discharge into the underlying soil and onto the surrounding areas and into the sewerage system. Principal Project Company shall ensure that wash waters from equipment and vehicle washing, wheel wash water, masonry wash waters, and other wash waters are captured and treated prior to discharge or disposal at a permitted facility that can accept that waste. Washout areas shall be covered prior to and during a precipitation event.
- H. Principal Project Company shall remove sediment and trash accumulated in drainages or detention basins as soon as possible. In addition, oil and material floating on water surface must be skimmed weekly and the debris properly disposed of. Principal Project Company shall cover waste disposal containers at the end of every business day and during a precipitation event.
- I. Principal Project Company shall minimize soil compaction in areas other than where the intended function of a specific area dictates that it be compacted.

- J. Principal Project Company shall implement the following materials selection and handling BMPs to the extent feasible:
1. Minimize exposure of construction materials, equipment, and maintenance supplies (e.g., fuels, lubricants, paints, solvents, adhesives) to precipitation.
  2. Identify and protect the products used and/or expected to be used and the end products that are produced and/or expected to be produced from exposure to stormwater. Products do not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (e.g., poles, equipment pads, cabinets, conductors, insulators, bricks, roofing, and siding).
  3. Implement BMPs to control the discharge of plastic materials and limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Principal Project Company shall consider the use of plastic materials resistant to solar degradation where plastic materials are deemed necessary.

### **3.5 SPILL AND LEAK CONTROL BEST MANAGEMENT PRACTICES**

- A. Principal Project Company shall assign and train spill-response personnel, who will address spills and leaks immediately and dispose of leaked materials properly in accordance with the law.
- B. Principal Project Company shall provide spill cleanup material on site to adsorb, remove and contain any spill or releases from leaving the active work area and entering into any storm drain or sewer inlet. Principal Project Company shall maintain a fully stocked spill kit(s) at the Project Site for immediate deployment. Principal Project Company shall keep enough spill cleanup material with vehicles and equipment to handle potential spills. Spill cleanup equipment will include absorbent socks, over pack drums, personal protective equipment, shovel, labels, valves, valve charts, valve wrenches to shut off water supply, etc.
- C. Principal Project Company shall ensure On-site vehicles are periodically monitored for leaks during the workday.
- D. Principal Project Company shall store inactive equipment with drip pans to contain any fluid leaks. Drip pans containing oil must be drained into waste oil drums on a regular basis.
- E. Principal Project Company shall ensure that all hazardous material stored on-site, including but not limited to lubrication oil, hydraulic fluids, waste oils, fuels, solvents and hazardous or toxic wastes, is stored in watertight secondary containment or in a completely enclosed storage area. The containment must be covered with temporary tarps to prevent storm water contact.
- F. Principal Project Company shall provide containment (e.g., secondary containment) of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants.
- G. Principal Project Company shall dispose of spent cleanup materials at a California-permitted waste-disposal facility. Leaked materials that constitute hazardous waste shall be disposed of in accordance with applicable hazardous materials specifications.
- H. Principal Project Company shall ensure that containers remain closed at all times except when transferring contents. Heavy containers (in excess of 60 lb.) of oil or hazardous material shall not be moved by a single unassisted worker unless the worker employs a drum dolly.
- I. Principal Project Company shall use funnels, pumps with closed hose systems, or other means to prevent spills while transferring material from large containers to small ones. Pumps in operation shall not be left unattended.

- J. Principal Project Company shall place all equipment or vehicles which are to be fueled in a designated area away from catchbasins fitted with functional, appropriate leak-containment BMPs. Principal Project Company shall (i) maintain clean fuel-dispensing area(s) using dry cleanup methods (sweeping for removal of litter and debris or use of rags and absorbents for leaks and spills), (ii) place drip pans or other containment beneath each connection point to capture all spills and drips, (iii) cover storm drains in the vicinity during transfer and (iv) maintain ample spill clean-up equipment adjacent to the fueling area.
- K. Principal Project Company shall conduct an end-of-day inspection of the Work area for leaks, spills or other discharges.
- L. Principal Project Company's designated Project Safety Officer shall immediately be alerted to any spill occurring in the Work area. It is the responsibility of the Project Safety Officer to direct the cleanup activities and contact City immediately in accordance with the requirements of the Contract Documents .
- M. Principal Project Company is responsible for recording all steps taken to control spills in the field notes/daily log.

### **3.6 EMISSIONS-CONTROL BEST MANAGEMENT PRACTICES**

- A. Principal Project Company shall comply with the following engine requirements:
  - 1. All off-road equipment greater than or equal to 25 horsepower shall have engines that meet U.S. EPA or California Air Resource Board (CARB) Tier 4 Final off-road emission standards. Principal Project Company shall register and obtain an Equipment Identification Number (EIN) per vehicle/equipment over 25 horsepower with the California Air Resources Board.
  - 2. Where access to alternative sources of power are available, portable diesel engines shall be prohibited. If access to alternative sources of power is infeasible, portable diesel engines shall meet the requirements of subsection 3.6.A.1 above.
- B. Principal Project Company may pursue the following waiver:
  - 1. City Planning Department may waive the equipment requirements of subsection 3.6.A.1 if a particular piece of off-road Tier 4 Final equipment is not regionally available, not technically feasible, or would not produce desired emissions reduction due to expected operating modes. In granting the waiver, Principal Project Company must demonstrate with substantial evidence that the project construction does not exceed the BAAQMD threshold for NOx (54 lbs/day) by resulting in a net increase of average daily NOx emissions greater than 4 pounds per day. The Principal Project Company must also demonstrate with substantial evidence that the overall combined construction and operational excess cancer risk does not exceed 7 per 1 million persons exposed at nearby sensitive receptors.
- C. Principal Project Company shall ensure that all equipment is tuned and maintained in accordance with the manufacturer's specifications. Principal Project Company shall instruct construction workers and equipment operators on the maintenance and tuning of construction equipment and require that such workers and operators properly maintain and tune equipment in accordance with manufacturer specifications.
- D. Principal Project Company shall limit the hours of operation of heavy-duty equipment and/or amount of equipment in use to what is needed.

- E. Principal Project Company shall prohibit idling of motors when equipment is not in use or when trucks are waiting in queues. The idling time of all construction equipment used at the site shall not exceed 5 minutes.
  - 1. Diesel engines, whether for off-road or on-road equipment, shall not be left idling for more than two minutes at any location, except as allowed for in applicable State regulations regarding idling for off-road and on-road equipment (e.g., traffic conditions, safe operating conditions). If such equipment is within 100 feet of a school zone idling times shall be limited to 30 consecutive seconds.
  - 2. Principal Project Company shall post legible and visible signs, in English, Spanish, and Chinese, in designated queuing areas and at the construction site to remind operators of the idling limit.
  
- F. Principal Project Company's Construction Emissions Minimization Plan (CEMP) requirements include:
  - 1. Before starting onsite construction activities, Principal Project Company shall submit a CEMP to City Planning Department for review and approval. The CEMP shall state, in reasonable detail, how Principal Project Company will meet the requirements of section 3.6 of this specification.
  - 2. The CEMP shall include estimates of the construction timeline by phase, with a description of each piece of off-road equipment required for every construction phase. The description may include, but is not limited to equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel use and hours of operation.
  - 3. Principal Project Company shall ensure that all provisions of the approved CEMP are incorporated into the Project Agreement Technical Requirements and are followed in daily construction activities. The CEMP shall include a certification statement that Principal Project Company agrees to comply fully with the CEMP.
  - 4. Principal Project Company shall make the CEMP available to the public for review onsite during working hours. Principal Project Company shall post at the construction site a legible and visible sign summarizing CEMP. The sign shall also state that the public may ask to inspect the CEMP for the project at any time during working hours and shall explain how to request to inspect the CEMP. Principal Project Company shall post at least one copy of the sign in a visible location on each side of the construction site facing a public right-of-way.
  
- G. Principal Project Company shall perform the following monitoring:
  - 1. After start of construction activities, Principal Project Company shall submit biannual reports to City Planning Department documenting compliance with the Construction Emissions Minimization Plan.

### **3.7 CONSTRUCTION NOISE CONTROL BEST MANAGEMENT PRACTICES**

- A. Prior to issuance of any demolition permit or building permit, Principal Project Company shall submit a project-specific construction noise control plan to City Planning Department for review and approval. The construction noise control plan shall be prepared by a qualified acoustical engineer, with input from the design-build contractor, and include all feasible measures to reduce construction noise. The construction noise control plan shall identify noise control measures to meet a performance target of construction activities not resulting in a noise level greater than 90 dBA at noise-sensitive receptors and 10 dBA above the ambient noise level at

noise-sensitive receptors. Principal Project Company shall ensure that requirements of the approved construction noise control plan are incorporated into the Project Agreement Technical Requirements and followed during construction activities. If nighttime construction is required, the plan shall include specific measures to reduce nighttime construction noise. The construction noise control plan shall also include measures for notifying the public of construction activities, complaint procedures, and a plan for monitoring construction noise levels in the event complaints are received. The construction noise control plan shall include the following measures to the degree feasible, or other effective measures, to reduce construction noise levels.

1. Use construction equipment that is in good working order, and inspect mufflers for proper functionality; and
2. Select “quiet” construction methods and equipment (e.g., improved mufflers, use of intake silencers, engineer enclosures); and
3. Use construction equipment with lower noise emission ratings whenever possible, particularly for air compressors; and
4. Prohibit the idling of inactive construction equipment for more than five minutes; and
5. Locate stationary noise sources (such as compressors) as far from nearby noise-sensitive receptors as possible (including future onsite noise-sensitive receptors at the Phase 2 Bryant Street housing development under phased construction scenarios for the refined project under the Final EIR), muffle such noise sources, and construct barriers around such sources and/or the construction site; and
6. Avoid placing stationary noise-generating equipment (e.g., generators, compressors) within noise-sensitive buffer areas (as determined by the acoustical engineer) immediately adjacent to neighbors (including future onsite noise-sensitive receptors at the Phase 2 Bryant Street housing development under phased construction scenarios for the refined project under the Final EIR); and
7. Enclose or shield stationary noise sources from neighboring noise-sensitive properties (including the future onsite noise-sensitive receptors at the Phase 2 Bryant Street housing development under phased construction scenarios for the refined project under the Final EIR) with noise barriers to the extent feasible. To further reduce noise, locate stationary equipment in pit areas or excavated areas, if feasible; and
8. Install temporary barriers, barrier-backed sound curtains and/or acoustical panels around working powered impact equipment and, if necessary, around the perimeter of active construction areas or phases. When temporary barrier units are joined together, the mating surfaces shall be flush with each other. Gaps between barrier units, and between the bottom edge of the barrier panels and the ground, shall be closed with material that completely closes the gaps, and dense enough to attenuate noise.
9. Under the phased construction scenarios for the refined project as defined in the Final EIR, develop strategies to reduce exposure to construction noise in coordination with future onsite noise-sensitive receptors at the Phase 2 Bryant Street Housing development under phased construction scenarios for the refined project under the Final EIR. Some options to reduce noise include limiting noise to Phase 2 Bryant Street housing development receptors by delaying or limiting occupancy in units closest to the construction zone or notifying receptors of loud construction periods. These options should be explored as part of the noise control plan prepared by a qualified noise consultant and the design-build contractor.

- B. The construction noise control plan shall include the following measures for notifying the public of construction activities, complaint procedures, and monitoring construction noise levels, including the following requirements, procedures, and corrective measures:
1. Designate an on-site construction noise manager for the project; and
  2. Notify neighboring noise-sensitive receptors within 300 feet of the project construction area at least 30 days in advance of high-intensity noise-generating activities (e.g. pier prilling, pile driving, and other activities that may generate noise levels greater than 90 dBA at noise-sensitive receptors) about the estimated duration of the activity (including future onsite noise-sensitive receptors at the Phase 2 Bryant Street housing development under the phased construction scenarios for the refined project under the Final EIR); and
  3. Post a sign onsite describing noise complaint procedures and a complaint hotline number that shall always be answered during construction, and provide to City and City Planning Department photographic documentation that the signage has been posted; and
  4. Implement a procedure for documenting all noise complaints received in a noise complaint log which shall be kept up to date and available to City upon request. At a minimum, the following information will be documented in the log: date of complaint, contact information for person providing a noise complaint, reason for the complaint, action taken and/or resolution; and
  5. Notify City within 48 hours of each noise complaint with an explanation of the corrective measures taken, if applicable, and notify City Planning Department within one week of receiving a complaint; and
  6. Establish a list of measures for responding to and tracking complaints pertaining to construction noise, taking all reasonable steps to resolve the complaint and the source of the noise impact, including providing additional monitoring as required, and modifying or implementing better attenuation controls for any construction equipment or activities that generated the excessive noise levels. Such measures may include the evaluation and implementation of additional noise controls at sensitive receptors (residences, hospitals, convalescent homes, schools, church, hotels and motels, and sensitive wildlife habitat); and
  7. Principal Project Company shall subsequently perform further periodic inspections to confirm that the modified or improved noise control minimization measures are effective; and
  8. Conduct noise monitoring (measurements) at the beginning of major construction phases (e.g., demolition, grading, excavation) and during high-intensity construction activities to determine the effectiveness of noise attenuation measures and, if necessary, implement additional noise control measures.
- C. The construction noise control plan shall include the following additional measures in the event of pile-driving activities:
1. When pile driving is to occur within 600 feet of a noise-sensitive receptor, implement "quiet" pile-driving technology (such as pre-drilling of piles, sonic pile drivers, auger cast-in-place, or drilled-displacement, or the use of more than one pile driver to shorten the total pile-driving duration [only if such measure is preferable to reduce impacts to sensitive receptors]) where feasible, in consideration of geotechnical and structural requirements and conditions;

2. Where the use of driven impact piles cannot be avoided, properly fit impact pile driving equipment with an intake and exhaust muffler and a sound-attenuating shroud, as specified by the manufacturer; and
  3. Conduct noise monitoring (measurements) before, during, and after the pile-driving activity.
- D. Notwithstanding the requirements stated in section 3.06.A and 3.06.B, before the onset of Construction Work, Principal Project Company shall implement minimization controls to ensure that the maximum noise level from any individual article of powered construction equipment other than to impact tools and equipment will not be greater than 80 dB(A) at 100 feet, to the greatest extent feasible.
1. Principal Project Company shall notify neighbors and occupants within 300 feet of the Project construction area at least 30 days in advance of impact-related noise-generating activities about the expected noise levels and their estimated duration.
  2. Principal Project Company shall implement the following controls with respect to the use of all impact equipment:
    - a. Noise from impact tools may not exceed 90 dBA 1-hour  $L_{eq}$  at the surface property line nearest to ongoing construction activities.
    - b. Impact tools and equipment shall have intake and exhaust mufflers recommended by the manufacturers thereof and approved by the Director of San Francisco Public Works or the Director of Building Inspection as best accomplishing maximum noise attenuation.
    - c. Pavement breakers, jackhammers, and similar impact equipment shall be equipped with acoustically attenuating shields and shrouds and/or jackets as recommended by the manufacturers thereof and approved by the City Planning Department.
    - d. Use of impact tools shall be restricted to the daytime construction hours of 8:00 a.m. to 3:30 p.m.
    - e. Principal Project Company shall use sonic or vibratory sheet pile drivers, rather than impact sheet pile drivers. Where the use of vibratory sheet pile drivers cannot be avoided, properly fit impact sheet pile driving equipment with an intake and exhaust muffler and a sound-attenuating shroud, as specified by the manufacturer.
    - f. Principal Project Company shall limit phases of construction that require daily use of impact equipment to periods of no more than 10 consecutive days.
  3. If, before construction mobilization, Principal Project Company determines that these standards and/ or one or more of these controls cannot be applied, Principal Project Company shall immediately alert the City Planning Department. If directed by the City Planning Department, Principal Project Company must revise the project-specific construction noise control plan and resubmit for City Planning Department review and approval. Principal Project Company's proposed revisions to the construction noise control plan must be prepared by a qualified acoustical engineer and demonstrate to the City Planning Department what alternative measures will be taken to reduce the impacts of construction noise to the extent feasible. The revised construction noise control plan must be approved by the City Planning Department and Principal Project Company shall enact all of its provisions before Project Principal Company commences Construction Work that may exceed the standards or omit the controls required above.

- a. If, as determined by City, the requirement for the construction noise control plan arises during the course of construction, such as through Principal Project Company's exceedances of these noise standards and/or by Principal Project Company's inability to apply one or more of these controls, Principal Project Company shall be directed by City to cease the use of equipment that is responsible for exceedances. Principal Project Company may resume the use of such equipment after the construction noise control plan is approved and all its provisions are enacted. City will not be responsible for any financial consequences to Principal Project Company of such work slowdowns or stoppages.
- E. Unless otherwise stated herein, Principal Project Company shall implement sufficient best-available control techniques to ensure that noise generated by each piece of powered construction equipment when in use is below the 80 dB(A) at 100 feet threshold. These may include but are not limited to any combination of the following:
  1. The use of mufflers, intake silencers, ducts, engine enclosures and acoustic attenuating shields, barriers, or shrouds for construction equipment and trucks.
  2. The use of hydraulic or electric-powered in preference to diesel-powered construction equipment.
  3. The use of drilling equipment in preference to impact equipment whenever feasible.
  4. Installation of temporary improvements to the noise-reduction capability of adjacent buildings.
  5. Erection of temporary plywood noise barriers around construction sites, and construction of temporary or permanent noise barriers around staging areas, shafts, and flow-control construction areas.
    - a. Where temporary barrier units are joined together, the mating surfaces shall be flush with each other. Gaps between barrier units, and between the bottom edge of the barrier panels and the ground, shall be closed with material that completely closes the gaps, and dense enough to attenuate noise.
- F. Principal Project Company shall locate stationary noise sources (e.g., ventilation fans, generators, dewatering pumps) as far away from the perimeter of the construction area as feasible and away from residential and commercial uses. Principal Project Company shall enclose equipment such as large compressors, generators, and large dewatering pumps at a minimum in 1-inch-thick plywood sheds. Openings in these enclosures shall face inwards towards the center of the Project-construction area.
- G. Principal Project Company shall direct all truck traffic to designated truck routes that avoid areas that are predominantly residential areas to the extent feasible.
- H. The Principal Project Company will periodically monitor the effectiveness of noise attenuation measures by taking noise measurements. In the event that noise exceedances are recorded, Principal Project Company shall modify existing or implement better attenuation controls for any construction equipment or activities that generated the excessive noise levels. Principal Project Company shall subsequently perform further periodic inspections and monitoring to confirm that the modified noise control minimization measures are effective.
  1. When directed by City, Principal Project Company shall submit revisions to the approved construction noise control plan for review and written approval if, in the sole determination of City, modified noise control minimization measures are not effective. In the event that revisions to the construction noise control plan are required, Principal Project Company shall cease the use of equipment that is responsible for exceedances.

Principal Project Company may resume the use of such equipment after the revised construction noise control plan is approved and all its provisions are enacted. City will not be responsible for any financial consequences to Principal Project Company of such work slowdowns or stoppages.

### **3.8 NATURALLY OCCURRING ASBESTOS (NOA)**

- A. For all work in any areas of serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA), as known through USGS map, soil assessment, soil sampling or other information, Principal Project Company shall adhere to the provisions of California Code of Regulations § 93105, Title 17, California Code of Regulations - Asbestos Airborne Toxic Control Measure (ATCM) for Construction and Grading Operations and CCR Title 8, Section 1529, Asbestos.
- B. If Principal Project Company disturbs, grades or excavates more than one acre (43560 sq. ft.) of area mapped as containing NOA, such Construction Work may not be implemented without first obtaining written approval by BAAQMD of an Asbestos Dust Mitigation Plan and written approval of City.
  - 1. In the event that a Project Change Order results in an exceedance of this threshold, no Project ground disturbance, grading, or excavation may occur without first obtaining written approval by BAAQMD of Asbestos Dust Mitigation Plan (ADMP), implementation of the ADMP, and written approval of City.
- C. At no cost to the City, Principal Project Company shall hire an experienced Certified Industrial Hygienist (CIH) to serve as Cal/OSHA Asbestos Class II asbestos operations Asbestos Competent Person (ACP).
  - 1. The ACP shall train Principal Project Company's workers and tradespeople who may come into contact with serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) for Class II work activity level as per the Cal/OSHA standard 8 CCR § 1529.
  - 2. The ACP shall be present at the Work site in compliance with requirements specified in the Cal/OSHA standard 8 CCR § 1529, and whenever Construction Work is conducted where serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) is present.
  - 3. The ACP shall enforce the dust-control provisions of these specifications.
- D. Before work in areas of NOA shown in the Design Documents that intersect with areas of roadway construction and maintenance which require the disturbance of soils by construction and grading, Principal Project Company shall submit the Bay Area Air Quality Management District's (BAAMQD) "Notification Form for Road Construction and Maintenance Operations" to BAAMQD fourteen business days in advance of land disturbance of soils containing NOA.
- E. Unanticipated Discovery of Naturally Occurring Asbestos (NOA):
  - 1. If NOA is unexpectedly encountered after the project has started, Principal Project Company shall immediately notify City and shall:
    - a. Submit a notification to the BAAQMD no later than the next business day using the Asbestos Dust Mitigation Plan (ADMP) Discovery Notification Form found at the link below:  
[https://www.baaqmd.gov/~/\\_media/Files/Compliance%20and%20Enforcement/Asbestos/admp\\_discovery\\_application.ashx?la=en](https://www.baaqmd.gov/~/_media/Files/Compliance%20and%20Enforcement/Asbestos/admp_discovery_application.ashx?la=en), and followed by email to the BAAQMD, and at the same time notify City with the same details.

- b. Principal Project Company shall immediately implement the ADMP provisions and may continue Construction Work with the written approval from City.
- c. Any measures imposed by the BAAQMD pursuant to the submittal of the ADMP Discovery Notification will be provided to City and implemented by Principal Project Company within 24 hours of receipt.

### **3.9 ASBESTOS DUST MITIGATION PLAN**

- A. If Principal Project Company by its means and methods disturbs, grades or excavates more than one acre (43560 sq. ft.) and the site is known through USGS map assessment, soil sampling or other information indicating that the Project will be disturbing NOA, as shown in the Design Documents, the following indicated control, administrative, reporting and submittal requirements will apply.
  - 1. Sixty days (60) days before commencement of grading, and excavation activities, Principal Project Company shall submit to City an Asbestos Dust Mitigation Plan (ADMP) for review.
  - 2. Upon City's written approval, Principal Project Company shall submit the ADMP, the ADMP application, and the BAAQMD Regulation 3 Fees to the APCO for its review and approval. Principal Project Company shall furnish all information required by the BAAQMD to amend and finalize the ADMP. Principal Project Company shall not be reimbursed for the BAAQMD Regulation 3 Fees.
  - 3. No soil disturbance, construction or grading shall commence unless the ADMP and its amendments is approved by the BAAQMD. Prior to commencement of any grading and excavation activities, Principal Project Company shall implement the ADMP. Principal Project Company shall implement and maintain the ADMP from the commencement of the Construction Work through the duration of the Project Construction Work.
  - 4. Principal Project Company at its own cost shall furnish all labor, equipment, and means required to prepare and implement the ADMP, conduct the ambient and perimeter air monitoring as required by the BAAQMD's terms of approval of the ADMP and California Code of Regulations, Title 17, Section 93105. Principal Project Company shall incorporate in its Project Schedule the time it will take for the BAAMQD to review and approve the ADMP application and the ADMP. Principal Project Company shall take into account and incorporate in its Project Schedule the time it will take for the BAAMQD to review the storage and staging locations, etc., for the final approval of the ADMP. Any fines imposed on the City by the BAAQMD as a result of Principal Project Company's negligence will be passed on to Principal Project Company.
  - 5. Principal Project Company, at no cost to the City, will perform perimeter air monitoring for asbestos at the Project Site during its soil disturbance activities for the duration of the Project. This will be in accordance with the approved ADMP. Principal Project Company shall submit all record keeping and reporting to the BAAQMD on a weekly basis or as per a reporting schedule requested by BAAQMD.

### **3.10 NIGHT WORK**

- A. If Principal Project Company is to perform any part of the Work between the hours of 8 p.m. and 7 a.m. or on weekends or holidays, subject to any and all special permits and authorizations, Principal Project Company shall comply with all of the following:
  - 1. Lighting Controls

- a. Lighting systems with flood, spot, or stadium type luminaires shall be aimed downward at the Work and rotated outward no greater than 30 degrees from nadir (straight down).
  - b. When, in the opinion of City, the lighting is disturbing adjoining property, Principal Project Company shall modify the lighting arrangement or add hardware to shield the light trespass.
  - c. When working adjacent to marine environments (the Pacific Ocean, San Francisco Bay, tidal inlets of the Bay), artificial lighting of the construction area during nighttime hours shall be minimized to the maximum extent practicable without substantial impairment of workers' safety and working conditions. At least two weeks prior to the commencement of Construction Work, Principal Project Company shall submit a lighting plan demonstrating that all lighting will be directed away from the marine environment and natural areas for written approval by City.
2. Noise controls:
- a. Principal Project Company must obtain and comply with a noise permit pursuant to Police Code Section 2908 prior to starting any Construction Work between the hours of 8 p.m. and 7 a.m. Principal Project Company must apply for noise permits at least 15 working days in advance of night (i.e., between 8:00 p.m. and 7:00 a.m.), weekend, and holiday work. The requirements of the Contract Documents, including safety requirements, apply for all night, weekend, and holiday Work performed. The noise permit will be obtained from and approved by Bureau of Street Use and Mapping, 49 South Van Ness Ave, Suite 3rd Floor, San Francisco, CA 94103.
  - b. Project Principal Company shall reduce the use of vehicles for night Construction Work that are legally required to be equipped with backing warning alarms to the extent feasible for night Construction Work, and Principal Project Company shall implement administrative controls as defined in the California Code of Regulations, Title 8 Sec. 1592 for worker protection for backing movements by other vehicles.
  - c. Principal Project Company shall not perform Construction Work between the hours of 8:00 p.m. and 7:00 a.m. of the following day if the noise level created thereby is in excess of the ambient noise level by 5 dBA at the nearest property line, unless approved by City and unless a noise permit for such work has been obtained pursuant to the Police Code Section 2908.

### **3.11 ENVIRONMENTALLY SENSITIVE AREA (ESA)**

- A. Principal Project Company shall be aware of and protect environmentally sensitive areas (ESAs) within or near construction limits where access is prohibited or limited in order to protect environmental resources.
  - 1. Principal Project Company shall implement Caltrans temporary fence Type ESA at the entire perimeter of any ESA -- Biology as shown in the Contract Documents.
  - 2. Principal Project Company shall prevent personnel and equipment from entering the ESA.
  - 3. Principal Project Company shall coordinate methods for avoidance intrusion into ESAs with City and provide written and photographic documentation of these methods used in the field before NTP2.

### 3.12 BIRD PROTECTION

- A. Principal Project Company shall perform all Construction Work in a manner that complies with the Migratory Bird Treaty Act (MBTA) and California Department of Fish and Game Code Section 3503, 3503.5, and 3513 (in addition to the Federal Endangered Species Act and California Endangered Species Act for listed birds).
1. Principal Project Company is advised that it is unlawful under the California Fish and Game Code at §3503 to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by California Code. Principal Project Company is advised that it is unlawful under the California Fish and Game Code at §3503.5 to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by California Code.
- B. Where Construction Work begins in advance of the bird-nesting season (February 15 through August 31), Principal Project Company shall be responsible for passively deterring birds from establishing active nests within the work area during construction, including on equipment. Methods for doing so may include installing bird deterrents (e.g., flash tape, false eyes, and audio deterrents), covering equipment with bird netting when not in use, and minimizing onsite attractants like slash or debris piles. Deterrents will be installed during the non-nesting season (September to February 14), unless otherwise approved by City. Principal project Company shall comply with the following:
1. Before trimming or removing trees, shrubs, and vegetation and/or performing structure alteration during bird nesting season (February 15 through August 31), a Qualified Biologist must be obtained by Principal Project Company to provide a pre-construction survey for nesting bird that may be affected during Construction Work.
  2. Principal Project Company's Qualified Biologist shall conduct the nesting bird pre-construction survey within the 14 days before the commencement of Construction Work. If commencement of Construction Work is delayed beyond the two-week timeframe, the survey shall be repeated. If Construction Work begins in different areas at different times or there are periods of more than two weeks when no Construction Work is being conducted, Principal Project Company shall ensure that additional surveys are conducted by the Qualified Biologist in each area before the commencement of Construction Work in such area.
  3. Principal Project Company shall be responsible for coordinating with City on schedule and confirming that surveys have been completed prior to initiation of any tree, shrub, and vegetation removal during this time. There will be no cost to the City (time or schedule) if there is a delay in the start of Construction Work at any location due to Principal Project Company's providing inadequate time for the Principal Project Company's Specialty Biological Monitor to perform a required survey.
  4. The Qualified Biologist shall conduct migratory bird surveys within 250 feet of the construction area boundaries for nesting passerines and 500 feet for nesting raptors, as allowed by landowner access.
  5. If no active nests are detected during surveys, then no additional mitigation is required.
  6. If inactive nests (those that do not contain eggs, chicks, or raptors that appear to be establishing a nest) are identified and removal is authorized in writing by the City, Principal Project Company shall provide equipment and labor to remove the nest. Principal Project Company shall assume the support of a man lift for 5 working days.

7. If active bird nests are identified by the Qualified Biologist, no Work may occur at that tree or structure and in the surrounding area:
    - a. For active nests found in trees, a 100-foot exclusion buffer of temporary fencing shall be erected around the tree with the active nest,
    - b. For active nests found on bridges, a 100-foot exclusion buffer shall be established around the nest site, and no Work may occur within the 100-foot buffer until the Qualified Biologist has verified that young birds have left the nest, and that active nesting has been completed.
    - c. For any active nests containing raptor species, the exclusion buffer will be 300-feet.
  8. Principal Project Company shall immediately upon finding an injured or dead bird or discovering migratory or nongame bird nests within or adjacent to limits of project construction:
    - a. Stop all Work within a 100-foot radius of the discovery.
    - b. Notify City.
  9. If active nests are detected, no Construction Work shall occur within 50 feet of any passerine nest or within 300 feet of any active raptor nest, unless otherwise allowed by the City.
- C. Principal Project Company shall perform one or a combination of the following protection measures as required to prevent further nesting by birds in trees or structures during Project construction:
1. Install exclusion devices
  2. Use nesting-prevention measures
  3. Remove and dispose of partially constructed and unoccupied nests of migratory or nongame birds on a regular basis to prevent their occupation.

### **3.13 BAT PROTECTION**

- A. Not applicable

### **3.14 TREE PROTECTION**

- A. Prior to NTP2, Principal Project Company shall arrange a meeting on the site with City, Contractor, and such others as City may direct to review the Project Schedule, the "Trees of Concern", the tree and landscape protection Submittals for this Section, the coordination with Work of other trades, and the selective thinning and clearing requirements. Adjustments to the type and extent of the protection shall be addressed at the time of the meeting.
1. Principal Project Company shall coordinate the meeting and inform all parties in writing (5) business days in advance of the scheduled meeting.
- B. Principal Project Company's equipment shall arrive on the Project Site clean of soil, seeds, and plant parts. Before tracked and heavy construction equipment leaves the Project Site, any accumulation of plant debris, soil and mud shall be washed off the equipment or otherwise removed onsite, and air filters shall be blown out. This shall be done in a manner that allows for collection of any plant debris, soil and mud for off-site disposal to prevent the spread of weeds.

- C. Principal Project Company shall implement the following practices and measures to prevent damage to trees within the area of Work:
1. Vehicles and equipment shall be operated in such a manner as to avoid damage to tree and bush trunks, leaves and branches. Principal Project Company shall ensure that no damage to trees or landscaping is caused by maneuvering of vehicles or equipment, stacking of materials and equipment, or storage of vehicles, equipment, or supplies.
  2. Pruning of trees shall be performed in conformance with the City of San Francisco Pruning Standards for Trees (June 27, 2006) (available at [https://sfpublicworks.org/sites/default/files/234-SF\\_Pruning\\_Std\\_6.27approved.pdf](https://sfpublicworks.org/sites/default/files/234-SF_Pruning_Std_6.27approved.pdf)), only as authorized by the City's Bureau of Urban Forestry, and under the supervision of the qualified arborist. Thinning shall not remove more than thirty percent (30%) of the existing leaf surface.
  3. Principal Project Company shall not place backfill under protected trees unless indicated otherwise. Where fill is required for grading, and as indicated in the Design Documents, no fill shall be placed above existing grade line at trunks. Fill soil must percolate at a rate of 1" per hour minimum.
  4. Principal Project Company shall not change site grades which cause drainage to flow into or to collect near protected trees.
  5. Principal Project Company shall not use protected trees as support posts, power poles, crane stays, sign posts, or anchorage for ropes, guy wires, power lines, or other similar functions.
  6. Principal Project Company shall not damage trees through exposure to excessive water or heat from equipment, utility line construction, or burning of trash under or near shrubs or trees.
- D. Principal Project Company shall implement the following practices and measures to prevent damage to tree roots:
1. Principal Project Company's vehicles and equipment shall not be driven off-road except along designated routes as far away as practical from tree root zones.
  2. Principal Project Company is prohibited from stockpiling any excavation or construction materials within the canopy of trees, on lawn areas or near shrubs.
  3. Excavated material (fill and overlay) shall not be deposited under the leaf/needle canopy of established trees. The excavated material shall be placed in piles along one side of a paved surface. In no case will Principal Project Company place the excavated material closer than 6-feet from the base of a tree.
  4. Principal Project Company shall immediately clean and remove any construction residue that falls within the canopy of a tree or near shrubs.
  5. Principal Project Company shall exclude grading or placement of heavy equipment within the drip line of trees on or adjacent to the site, unless approved by City. If approved by City, Principal Project Company's arborist will recommend and Principal Project Company shall implement measures to protect the tree (e.g., protecting the roots from compaction). Principal Project Company shall be responsible for replacing any damaged trees as directed by the City Planning Department.
  6. Principal Project Company shall tunnel around roots where practical; otherwise, roots will be cut off approximately six inches (6") from construction and shall comply with the following:

- a. Principal Project Company shall not rip or tear roots and shall prune injured roots cleanly and backfill as soon as possible.
  - b. If trimming of roots greater than 2-inches in diameter or fibrous root bundles of similar diameter is necessary during the course of construction, a Qualified Arborist provided by Principal Project Company shall supervise the trimming of such roots.
  - c. If immediate backfill is not possible, exposed roots shall not be allowed to dry out before permanent backfill is placed. Temporary earth cover shall be provided, or exposed roots shall be packed with wet peat moss or four (4) layers of wet untreated burlap and temporarily supported and protected from damage until permanently covered with backfill.
7. Principal Project Company shall not induce damage to tree root systems from flooding, erosion, excessive wetting or drying resulting from dewatering or other operations.
8. Principal Project Company shall observe the following restrictions on underground trenching in the vicinity of trees:
- a. Principal Project Company is prohibited from using powered equipment for trench and excavation Work within the tree drip line or where root intrusion exists on asphalt pathways to be reconstructed without written approval from City prior to start of such excavation work. Principal Project Company shall retain a Certified Arborist as needed to provide written direction at Principal Project Company's expense.
  - b. When excavating or trenching within the canopy of trees to remain, the Planning Department will be given 48 hours' notice.
  - c. Trenching within the canopy of trees may not proceed without a professional arborist present to perform compensatory root and branch pruning.
  - d. Principal Project Company shall place all piping 3 ½-inches and smaller and all conduits a minimum of 18-inch below the existing finished grade. New conduits shall be located at least 25-feet away from all tree trunks, 20-feet away from all buildings, 10-feet away from any pathway lighting, and 5 feet away from and parallel to any asphalt or concrete paths.
  - e. Principal Project Company shall place all piping 4-inches and larger a minimum of 3-feet below the existing finished grade except when approved by the City Planning Department to clear root systems. In no case shall the 4-inch or larger pipe be placed less than 2-feet below the finished grade.
  - f. Principal Project Company shall bend and/or transition underground conduit and piping so that the conduit or piping will thread between tree roots.
  - g. When possible, trenches shall not be run of the side of the tree exposed to prevailing winds as roots are primarily anchored on the windward side. Trenches shall not be cut across more than one quadrant of the tree root zone.
  - h. In areas where trenching is required under low hanging tree branches (8 to 12-feet off the ground), Principal Project Company shall operate equipment to a maximum height of 10-feet to avoid contact and possible damage to the tree branches.
  - i. Piping and conduit trenching work shall include the use of machinery that will not extend above 10-feet vertically for 5% of the linear trenching performed.

- j. Trenching to a maximum of 3-feet as measured horizontally may be executed without written approval from the City Planning Department for the placement of pipe fittings and quick couplers at any location outside the drip line of any tree.
  - 9. Trees to be preserved within the Work area shall be protected by Principal Project Company as follows:
    - a. 6-foot tall temporary tree protection composed of 2x4s shall be constructed to surround the outer edge of the tree basin.
    - b. 2x4s shall be mounted on 2-inch diameter galvanized iron posts, which shall be anchored into the soil on opposite corners of the guard and driven into the ground to 2-foot depth, avoiding any roots greater than 2-inches in diameter.
    - c. 2x4s shall be installed as a toe board surrounding the base of the tree protection for ADA compliance.
    - d. Orange snow fencing shall be placed around the tree protection.
    - e. Refer to Appendix 'A' for additional information.
  - 10. Principal Project Company shall install on all trees within a band extending six feet past the limits of the Construction Work hay bales or rolls of erosion control wattling, secured around trunk to a height of 6 feet, or as otherwise directed by City.
- E. Principal Project Company is informed that San Francisco is a Quarantine County for the Sudden Oak Death pathogen *Phytophthora* and that where trees of the following species are known by Principal Project Company to be removed, or marked on the plans as intended for removal, by grubbing or otherwise, or pruning -- Coast Live Oak (*Quercus agrifolia*), Canyon Live Oak (*Quercus chrysolepis*), California Black Oak (*Quercus kelloggii*), Shreve's Oak (*Quercus parvula* var. *shrevei*), Tanoak (*Notholithocarpus densiflorus*), California bay laurel (*Umbellularia californica*) -- the following precautionary measures against the spread of *Phytophthora* will apply.
- 1. Plants of species that may harbor *Phytophthora* shall be chipped on site and the chips spread at the location of the same trees and/or shrubs that produced the debris. This plant debris may not be used for any purpose at any other location.
  - 2. If spreading on site is not possible, materials shall be disposed of in landfill or at an industrial-scale composting facility. Principal Project Company shall provide documentation of such disposal to the City Planning Department.
  - 3. For sites identified as potentially harboring *Phytophthora*, Principal Project Company shall ensure that the following actions are performed:
    - a. All workers scrape, brush, and/or hose off accumulated soil and mud from clothing, gloves, boots, and shoes before leaving the site.
    - b. Mud and plant debris are removed by blowing out or power washing chipper trucks, chippers, bucket trucks, fertilization and soil aeration equipment, cranes, and other vehicles before leaving the site.
    - c. Soil and mud are removed or washed off from on vehicle tires, boots, shovels, stump grinders, trenchers, etc., before use at another site.
    - d. Tools used in tree removal/pruning are disinfected with Lysol® spray, a 70% or greater solution of alcohol, or a solution consisting of 1 part household bleach to 9 parts water before leaving the site.

### 3.15 SITE RESTORATION

- A. Principal Project Company shall furnish all material, labor, equipment, and service necessary to revegetate disturbed areas whose surface is not otherwise converted to gravel, pavement, new landscaping as indicated on plans, or new facilities.
- B. Principal Project Company shall strip and dispose of at an offsite location the top three inches of soil from work areas where soil will be left exposed after the conclusion of Construction Work. Any remaining topsoil below this depth up to 12 inches deep generated during site grading and/or excavation shall be stockpiled separately onsite for reuse during revegetation. All topsoil stockpiles shall be covered with plastic and labeled while stored onsite to avoid improper use or disposal.
- C. Principal Project Company shall ensure that any imported fill material, soil amendments, gravel etc., required for construction and/or restoration activities that would be placed in the upper 12 inches of the ground surface are free of vegetation and plant material. Certified, weed-free, imported erosion-control materials (or sterile rice straw in upland areas) shall be used exclusively.
- D. Revegetation
  1. Principal Project Company shall ensure that all seed complies with the California Seed Law of the Department and Agriculture. Seed materials shall meet all applicable inspections required by law. No non-native or invasive species shall be used in any restoration seeding.
  2. Principal Project Company shall ensure that all seeding occurs between September 15 and December 15 unless otherwise approved by City.
  3. Prior to hydroseeding, Principal Project Company shall prepare disturbed areas whose surface is not otherwise converted to gravel, pavement, or new facilities as seed beds, including:
    - a. Scarifying and decompacting soils to a depth of no less than 12 inches; and
    - b. Removing rocks greater than ½ inch and removing weeds; and
    - c. Restoring stockpiled topsoil; and
    - d. Incorporating sufficient compost to restore the area to original grade after having been trackwalked. Compost producers must be permitted by the Department of Resources Recycling and Recovery, Local Enforcement Agencies, and any other State and local agencies that regulate solid waste plants. If exempt from State permitting provisions, the composting plant must certify it complies with the guidelines and procedures for production of compost under 14 CA Code of Regs § 17868. Compost producers must be participants in the United States Composting Council's seal of testing assurance program.
  4. Principal Project Company shall ensure that commercially obtained seed is labeled according to State and federal laws, under the California Food and Agricultural Code, and by the vendors supplying the seed. Seed shall be delivered to the Project Site in unopened supplier's sealed containers bearing original certification labels and the seed tag attached. Containers opened prior to inspection or without a label or tag shall not be accepted. Each seed bag shall be delivered to Project Site sealed and clearly marked as to the species, purity, percent germination, weed seed, inert material, dealer's guarantee, and date of test.

5. Principal Project Company shall store seed in a cool dry location away from moisture and contaminants. Seed materials shall be stored on site for no longer than two weeks. All storage locations shall be subject to written approval by City.
6. Principal Project Company shall ensure that seed is State-certified of the latest season's crop. Seed shall be delivered in original sealed packages bearing producer's guaranteed analysis for purity, germination, weed seed content, and inert material. Seed bags shall include manufacturer's tags in conformance with AMS Seed Act and applicable State laws. Wet, moldy, or otherwise damaged seed will be rejected by City.
7. Principal Project Company shall ensure that seed has been tested for purity and germination not more than (15) fifteen months prior to the application of the seed.
8. Principal Project Company shall ensure that seed is stock origination from within the San Francisco Bay Area Counties (San Francisco, San Mateo, Santa Cruz, Santa Clara, Alameda, Contra Costa, Solano, Napa, Sonoma, Marin). Seed suppliers include Pacific Coast Seed, Livermore, CA (925) 373 4417; Lerner Seed, Bolinas, CA (415) 868 9407; Hedgerow Farms, Winters, CA (530) 662-6847; and others.
9. Principal Project Company shall ensure that the minimum quantity of seed to be applied is in the quantities for each species (in pounds per acre) recommended by the seed supplier, mixed proportionally, which must be stated on the supplier's original label(s) on the original sealed packages.
10. Principal Project Company shall ensure that seed mix is as specified in column A "SEED MIX", below. If one or more species of grass, wildflower, and/or subshrub is not readily available, Principal Project Company may substitute a species of grass, wildflower, and/or subshrub from column B "SUBSTITUTIONS" below. For linear areas of restoration, such as may be required to restore areas following trenching, less than 4' in width, subshrub species may be omitted. Other modifications to the seed mix may be made if approved by City. Principal Project Company shall allow at least 14 working days for written approvals to modifications to the seed mix.
11. Principal Project Company shall ensure that seed is a minimum of 70 percent Pure Live Seed and 80 percent Germination unless otherwise approved in advance by City.

E. SEED MIX

1. SEED MIX

*Achillea millefolium* (Yarrow, wildflower)

*Acmispon glaber* (deerweed, subshrub)

*Artemisia californica* (California sagebrush, subshrub)

*Bromus carinatus* (California brome, grass)

*Elymus glaucus* (Blue wildrye, grass)

*Eschscholzia californica* (California poppy, wildflower)

*Festuca microstachys* (Small fescue, grass)

*Hordeum brachyantherum* (California meadow barley, grass)

*Lupinus bicolor* (annual lupine, wildflower)

*Stipa pulchra* (Purple needlegrass, grass)

2. SUBSTITUTIONS

*Chlorogalum pomeridianum* (amole, soap plant, wildflower)

*Diplacus aurantiaca* (sticky monkeyflower, wildflower)

*Eriogonum nudum* (Naked buckwheat, subshrub)

*Grindelia stricta* var. *platyphylla*, (beach gum daisy, wildflower)

*Hordeum brachyantherum* (California meadow barley, grass)

*Iris douglasiana* (Douglas iris, wildflower)

*Lupinus microcarpus* (chick lupine, wildflower)

*Phacelia californica* (California phacelia, wildflower)

*Scrophularia californica* (California bee plant, wildflower)

*Trifolium ciliolatum* (foothill clover, wildflower)

*Trifolium wormskioldii* (cow clover, wildflower)

- F. Principal Project Company shall ensure that tackifier is applied as part of the hydroseed slurry if hydroseed method is employed. If broadcast seeding method is employed, tackifier or sterile straw may be applied after seeding. Principal Project Company shall comply with the following:
1. Mixing shall be performed in a tank with a built-in, continuous agitation and recirculation system of sufficient operating capacity to produce a homogeneous slurry and a discharge system that will apply the slurry at continuous and uniform rate. The tank shall have a minimum working capacity of 700 gallons. City may authorize in writing the use of equipment of smaller capacity if it is demonstrated that such equipment is capable of performing all the operations satisfactorily. Mixing shall be performed in the presence of Principal Project Company's QC Manager and City. Principal Project Company shall submit bags of materials used in the mix to City.
  2. Water, fiber, stabilizing emulsion and other ingredients except seed shall be added to the tank simultaneously so that the finished load is a homogeneous mix of the specified ingredients. Seed shall be added last and shall be discharged within 1 hour. If mixture remains in tank for more than 1 hour, it shall be removed from the job site and replaced at Principal Project Company's expense. Once fully loaded, the slurry shall be agitated for 5 minutes to allow for uniform and thorough mixing. The slurry shall have the proper consistency to adhere to the soil even on slopes without clumping or running. Slurry shall be uniformly applied in a sweeping motion under pressure over the entire designated area to form a mat. The hydroseeded area shall not be rolled.
  3. Seed and tackifier shall be applied to the disturbed areas in one operation at rates of 50 pounds per acre and 90-120 pounds per acre, respectively. At all times, materials shall be kept uniformly mixed in the hydromulcher tank during the application operation.
- G. For areas greater than 2,500 sq feet, Principal Project Company shall utilize hydroseeding, but for areas under 2,500 sq feet, Principal Project Company shall broadcast seed, rake in the seed in two directions and cover with 1 inch layer of compost.

**3.16 NOT USED**

### **3.17 HUMAN REMAINS**

- A. If the body of a deceased human being in any stage of decomposition or completeness is encountered, all work in the area must halt and the San Francisco County Coroner must be contacted, pursuant to California Public Resources Code Sections 5097.98, and 5097.99.

### **3.18 ARCHAEOLOGICAL RESOURCE PROTECTION**

- A. Prior to issuance of construction permits, Principal Project Company shall have an Archeological Monitoring Plan reviewed and approved by City Planning Department. Principal Project Company shall ensure compliance with the approved Archeological Monitoring Plan which shall govern for the associated construction activities as stated in the approved plan.
- B. Any soil disturbing activities below a depth of two feet below ground surface by Principal Project Company shall be preceded by the distribution by Principal Project Company of the San Francisco Planning Department archeological resource “ALERT” sheet to any Principal Project Company Contractor or Subcontractor (including demolition, excavation, grading, foundation, pile driving, etc. firms); or Utility involved in soil disturbing activities within the Project Site, and all field personnel, including machine operators, field crew, pile drivers, supervisory personnel, etc..
  - 1. Following the distribution of the “ALERT” sheet, Principal Project Company shall provide City with a signed affidavit confirming that all field personnel have received copies of the “ALERT” sheet.
    - a. The “Alert” sheet and affidavit are available for download at:  
<https://www.sfpublishworks.org/services/project-manual-and-reference-documents>
  - 2. If potential subsurface archaeological resources are discovered at the site, Principal Project Company shall promptly report their discovery to City. Subsurface archaeological finds may include any of the following:
    - a. Concentrations of shellfish remains
    - b. Evidence of fire (ashes, charcoal, burnt earth, fire-cracked rocks)
    - c. Concentrations of bones
    - d. Recognizable Native American artifacts (arrowheads, shell beads, stone mortars (bowls), humanly shaped rock)
    - e. Building foundation remains
    - f. Trash pits
    - g. Privies (Out-house holes)
    - h. Floor remains
    - i. Wells
    - j. Concentration of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.
    - k. Debris from the Great 1906 Earthquake and Fire (thick layers of burned building debris, charcoal, nails, fused glass, burned plaster, burned dishes, etc.)
    - l. Wood structural remains (building, ship, wharf, etc.)

- m. Clay roof/floor tiles
  - n. Stone walls or footings
  - o. Gravestones
3. City will issue a written order to suspend work directing Principal Project Company to cease all Construction Work only at the location of the potential cultural resources find to allow City to assess the significance of the find.
  4. Principal Project Company shall comply with all applicable Laws and any additional avoidance and minimization measures specified by City to minimize potential effects on cultural resources, which may include additional site security.
- C. Where any soil-disturbing activity below the depth specified in paragraph 3.18(B)(1) below is to occur within an area noted and depicted on the Design Documents as an area of particular archaeological sensitivity for which monitoring is required, a Specialty Environmental Monitor – Archaeologist, provided by Principal Project Company, shall be present to conduct monitoring for the presence of potential archaeological resources. Principal Project Company shall comply with the following:
1. Archaeological monitoring is required for any ground disturbance below 2 feet of the existing ground (paved or unpaved) surface.
  2. Principal Project Company shall be responsible for confirming that the required Specialty Environmental Monitor – Archaeologist is on-site as required prior to performing said work.
  3. The Specialty Environmental Monitor – Archaeologist may order Principal Project Company to cease Work if a potential archaeological resource is detected. The Principal Project Company shall notify City immediately of such order. The Principal Project Company shall cease all construction operations only at the location of the potential archeological resource find to allow City to assess the significance of the find.
  4. Principal Project Company shall comply with all applicable Laws and any additional avoidance and minimization measures specified by City to minimize potential effects on archeological resources, which may include additional site security. Principal Project Company is advised that the discovery of unique archaeological resources may entail extended periods of work suspension.

**3.19 HISTORIC CULTURAL RESOURCE PROTECTION**

- A. Principal Project Company shall protect historic resources shown and labeled in the Design Documents and Reference Documents that are adjacent to, or in the right-of-way adjacent to or occupied by, the Project, including:
1. Not used.
  2. All distinctive sidewalk elements, such as brick surfacing, brick gutters, granite curbs, cobblestones, non-standard sidewalk scoring and streetscape elements such as terrazzo finishes, sidewalk lights, and special sidewalk finishes that appear to be 45 years or older are potential historic resources and shall be protected in place, salvaged and re-installed, or replaced in kind to match the character of the existing condition as shown in the Design Documents or Reference Documents and/or found in place. Principal Project Company shall avoid damaging and protect in place any features described above and shall notify City of any feature not identified in the Design Documents that is in conflict with the proposed Work.

- B. Principal Project Company shall comply with San Francisco Public Works Orders for the restoration of granite (granodiorite) curb in historic districts and the preservation of existing granite curb and existing surficial bricks and cobblestones, and shall comply with the following:
1. Compliance information shown in the Contract Documents:
    - a. All existing granite curb, and existing surficial bricks and cobblestones, within the area of proposed curb-and-gutter work is shown on the Project construction drawings.
    - b. The areal extent of All National Register of Historic Places historic districts, California Register of Historical Resources historic districts, and historic districts as identified by San Francisco Planning Code Articles 10 and 11 districts, for which the period of historic significance is coeval with the period of use of granite as a curb material by the City of San Francisco is shown on the project construction drawings.
    - c. The Principal Project Company is hereby informed that the following limits of Work are located within a historic district as shown in the Design Documents:
      - 1) None
  2. Except as noted below, all linear sections of curb, including driveways, within the Project limits within the limits of a historic district, regardless of existing condition, shall be restored using granite salvaged during demolition of the existing curb, supplemented with replacement granite sections, regardless of whether the curb line has moved.
    - a. Granite curb within the boundaries of a historic district shall only be replaced with concrete curb for new curb ramp radius construction, or as part of new linear and radius curb sections of new curb corner extensions installed for traffic calming ("bulb-outs").
    - b. A corner extension that extends for longer than the minimum distance required for the installation of corner ADA curb ramps is considered sidewalk widening; such sections shall require the installation of granite curb.
    - c. No granite, cobblestones, or brick gutter shall be restored within a pedestrian accessible route (PAR) (see San Francisco Public Works Order No: 200369).
  3. Any granite curb section not within a historic district shall be salvaged and reset in the location from which it was salvaged. If the curb line is moved as a result of the Project, the salvaged granite curb shall be reset parallel to its previous location. Salvaged granite curb is not required to be used on new linear and radius curb sections of new curb corner extensions ("bulb-outs") and may not be reused within a PAR.
  4. Granite curb shall be installed in sections a minimum of 4-feet in length. If a section of granite to be replaced or restored is less than 4' long, then the scope of Work must be expanded so that the minimum length of any single length of granite installed by Principal Project Company or extant and retained in position is a minimum of 4' long.
  5. City stockpiles of salvaged granite curb, when available, are made available to Principal Project Company upon application to the relevant department.
  6. Specifications for new granite curb are as follows:
    - a. Material: Stone curb shall be made from granite, free from defects or flaws that might impair its usefulness as curb.

- b. Dimensions: Each piece of curb shall be at least 4 feet long, 6 inches thick at top and bottom, and 16 inches deep.
  - c. Dressing: The top of the curb and its face for a depth of 6 inches shall have a first-class peen-hammered finish. These surfaces shall be true and properly squared and have no holes. A tolerance of 1/4 inch will be allowed in width of top of curb. The back of the curb, for a depth of 2 inches, shall be pointed to a fair surface, free from inequalities exceeding 1/2 inch, when measured from a straight edge. The joints of the curb shall show an even edge for a depth of 8 inches and will be kept full. The joints below the dressed portion shall not be pitched more than 1/4 inch under square. The joints throughout the dressed portion of the ends shall not exceed 1/4 inch. All edges bordering dressed surfaces shall be sharply defined.
  - d. Where gutters are deeper than 6 inches, the face of the granite curb shall be peen-hammered to the full depth of the gutter. The lower part of each stone shall be roughly squared and shall have an average thickness of not less than 6 inches at the bottom and at no point shall the thickness be less than 4 inches.
  - e. The curb for corners shall be cut to the prescribed curved lines, with joints on true radial lines. The joints between the several blocks of stones shall not exceed 1/8 inch.
  - f. Previously salvaged granite curb that meets the above specification is acceptable.
7. Except as noted above (PAR, bulb-outs), existing brick gutter shown on drawings shall be salvaged and reset in its original location, and existing surficial cobblestones shall be salvaged and reset in their original location.
- a. City stockpiles of salvaged brick will be made available to Principal Project Company if available upon application to the relevant department. New replacement gutter brick shall be brick of approximately the same dimensions and approximate color of the existing brick and shall conform to ASTM standard specification C1272 – 17 for Heavy Vehicular Paving Brick Type R as well as meet criteria set forth in San Francisco Public Works guidance for slip resistance.
  - b. Other than brick gutter to be replaced/restored, no brick or cobblestone surfacing may be removed from the surface of the travel way without prior written approval by City.
8. Principal Project Company shall exercise care to minimize damage in transporting salvaged granite curb, brick, and cobblestones that Principal Project Company is returning to City.
- a. Minimum size of cobblestone that may be returned is 4 inches square (16 square inches). Bricks to be returned must be whole.
  - b. Principal Project Company shall neatly and securely place the granite curb on pallets so it can be moved about safely after delivery. The cobblestones and/or brick shall be neatly and securely placed on pallets so they can be moved about safely after the delivery.
  - c. The salvaged granite curb, bricks, and cobblestones that will not be reset shall be delivered, including off loading, to a storage site within the City. Principal Project Company shall provide a minimum of forty-eight (48) hours prior notice of delivery, and delivery is limited to Monday through Friday 8:00 a.m. to 2:00 p.m. Principal Project Company shall provide a forklift for unloading.

- d. Prior to transporting, Principal Project Company shall ensure that the brick and/or cobblestones are cleaned of dirt, grout and/or concrete. Principal Project Company shall take care during the transporting of the brick and cobblestones to minimize damage before delivery to City.

C. NOT USED

**3.20 SAN FRANCISCO ENVIRONMENT CODE CLEAN CONSTRUCTION REQUIREMENTS FOR WORK IN AN AIR POLLUTANT EXPOSURE ZONE (APEZ)**

- A. Principal Project Company is informed that as the Project will use off-road powered construction machinery and is projected to last longer than 19 days, the following additional requirements of San Francisco Environment Code Chapter 25 apply. These requirements may be waived by the City Planning Department at the Contractor's request if the City Planning Department determines the absence of sensitive uses as defined by the Environment Code within 1,000-feet of the project construction limits as shown on the project drawings and/or if the project requires a limited amount of Off- Road Equipment for a limited duration.
- B. Reference section 3.06.A and 3.06.B of this specification regarding equipment engine emissions standards, sources of power, and waivers.
- C. Principal Project Company shall submit a Construction Emissions Minimization Plan (CEMP) to the City Planning Department for review and written approval for compliance with Chapter 25 of the San Francisco Environment Code.
- D. Principal Project Company shall submit its initial CEMP no less than 28 days prior to mobilization. The CEMP will state, in reasonable detail, how the Principal Project Company shall meet the requirements of Section 2505 of the Environment Code.
  - 1. The CEMP shall include estimates of the construction timeline by phase, with a description of each piece of off-road equipment required for each Construction Phase.
  - 2. The description shall include equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation.
  - 3. For the VDECS installed, the description shall include technology type, serial number, make, model, manufacturer, CARB verification number level, and installation date and hour meter reading on installation date.
  - 4. For off-road equipment using alternative fuels, the description shall also specify the type of alternative fuel.
  - 5. Principal Project Company may use the Clean Construction Equipment Inventory Template to satisfy the CEMP requirements. Refer to the following link for that template: <https://www.sfdph.org/dph/EH/Air/CleanConstruction.asp>
- E. Principal Project Company agrees to comply fully with the CEMP and acknowledges that a significant violation of the CEMP will constitute a material breach of the Agreement. Principal Project Company must submit a signed CEMP Certification Statement to the City Planning Department. Refer to the following link for the Emissions Plan Certification Statement Template: <https://www.sfdph.org/dph/EH/Air/CleanConstruction.asp>.
- F. After City Planning Department review and written approval, Principal Project Company shall make the CEMP available to the public for review onsite during working hours.

- G. Principal Project Company shall post at the construction site a legible and visible sign summarizing the CEMP. Refer to the following link for the Clean Construction Sign Template: <https://www.sfdph.org/dph/EH/Air/CleanConstruction.asp>.
  - 1. The sign shall also state that the public may ask to inspect the CEMP for the project at any time during working hours and will explain how to request to inspect the CEMP.
  - 2. Principal Project Company shall post at least one copy of the sign in a visible location on each side of the construction site facing a public right-of-way.
- H. Principal Project Company shall submit quarterly and biannual reports to City Planning Department documenting compliance with the CEMP within seven business days of the end of each quarter.
- I. Principal Project Company shall submit a final CEMP report within four weeks of achieving Substantial Completion summarizing compliance of the Construction Work with the CEMP, including the start and end dates and duration of each Construction Phase
- J. The San Francisco Public Works Director may waive requirements of Chapter 25 of the Environment Code on the grounds set forth in Section 2507 of the Environment Code at the request of Principal Project Company, if such request is submitted to the City Planning Department
  - 1. For any waiver granted, the City Planning Department will within two business days prepare a written notice of the waiver and a written memorandum explaining the basis for the waiver and the steps that will be taken to safeguard public and City employee health during the noncomplying work. The memorandum will also state the requirements subsequently imposed upon the contractor to minimize the use of noncomplying equipment or engines during the noncomplying work.
  - 2. Requests for such waivers must be provided to the City Planning Department no fewer than two weeks prior to the planned implementation of the waiver and must be accompanied by conclusive substantiating information. Waivers are granted at the sole discretion of the San Francisco Public Works Director. The City will provide no compensation to the contractor for any consequences of the denial of a waiver request.

**3.21 CONSTRUCTION SITE RUNOFF CONTROL PERMIT**

- A. Principal Project Company shall obtain a Construction Site Runoff Control Permit from the San Francisco Public Utilities Commission, Wastewater Enterprise, Collection System Division (SFPUC-WWE/CSD).
  - 1. The Construction Site Runoff Control Permit Application shall include an Erosion and Sediment Control Plan (ESCP) developed signed and stamped by a Qualified Stormwater Pollution Prevention Plan Developer or Practitioner (QSD or QSP). The Erosion and Sediment Control Plan shall include a vicinity map showing the location of the Project Site in relationship to the surrounding area's water courses, water bodies, and other significant geographic features; a site survey; suitable contours for the existing and proposed topography, area drainage, proposed construction and sequencing, proposed drainage channels; proposed erosion and sediment controls; dewatering controls where applicable; soil stabilization measures where applicable; maintenance controls; sampling, monitoring, and reporting schedules; and any other information deemed necessary by the SFPUC.
    - a. A SWPPP for which a WDID has been issued will be accepted in lieu of an ESCP.

- B. Principal Project Company shall submit the Construction Site Runoff Control Permit Application within (30) thirty calendar days after NTP 2 for review and approval by City. Principal Project Company is responsible for obtaining the Construction Site Runoff Control Permit in a timely manner and prior to the commencement of any land-disturbing activities.
  - 1. Concurrent with the approved ESCP, Principal Project Company shall provide City with a checklist for City's written approval prepared and stamped by the QSD or QSP listing all requirements of the ESCP.
- C. Principal Project Company shall not commence demolition or earthmoving activities until City has verified ESCP implementation.
  - 1. If required by the terms of the Construction Site Runoff Control Permit, or at the request of City, Principal Project Company shall also provide a QSD or QSP to verify ESCP implementation to the satisfaction of City.
- D. At least two working days before each the following milestones, Principal Project Company shall provide the SFPUC with a transmittal, with a copy to City, to inform the SFPUC inspector that the following are about to occur:
  - 1. Commencement of Construction Work.
  - 2. Erosion and sediment control measures are completely installed and stabilized.
  - 3. Final grading has been completed.
  - 4. Substantial Completion.
- E. Principal Project Company shall maintain a copy of the Construction Site Runoff Control Permit and Erosion and Sediment Control Plan onsite at all times.
- F. Principal Project Company shall daily inspect, maintain, and repair all graded surfaces and erosion and sediment controls, drainage structures, and other protective devices, plantings, and ground cover installed while construction is active.
- G. Every person who operates any erosion and sediment control or controls must provide analytical inspection and maintenance information as set forth in the Construction Site Runoff Control Permit.
  - 1. Unless otherwise specified by the terms of the Construction Site Runoff Control Permit, the QSP/QSD or personnel trained by the QSP/QSD will use City -approved checklist to document weekly visual inspections to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended.
  - 2. Principal Project Company shall keep all completed inspection checklists and related documentation with the ESCP on-site or electronically and transmit copies of the previous month's checklists to City on the first business day of each month during project construction accompanied by a certification under penalty of perjury that such information is accurate and true.
- H. Principal Project Company shall permit City and/or representatives of the SFPUC to perform inspections as may be deemed necessary.
- I. Principal Project Company shall provide devices or locations necessary to conduct sampling or metering operations, if required by the terms of the Construction Site Runoff Control Permit and/or requested by City.

1. If effluent water-quality monitoring is required by the Construction Site Runoff Control Permit, sampling must be performed by a QSD, QSP, or persons trained by the QSP. pH and turbidity may be assessed using field meters; all other parameters will require laboratory analysis unless an exception is approved by City. Monitoring reporting shall be as prescribed in the project Construction Site Runoff Control Permit.

- J. Principal Project Company's QSD shall (i) immediately inform City in the event that Project Change Orders or other change in construction conditions alters the implementation of the ESCP, (ii) update the ESCP to address changes affecting construction site-runoff management, and (iii) submit the revised ESCP to the SFPUC. Principal Project Company shall implement the revised ESCP as soon as feasible after acceptance by the SFPUC. Principal Project Company shall immediately communicate any additional modifications to the ESCP requested by the SFPUC to the City Planning Department and the City

### **3.22 NOT USED**

### **3.23 CITY WATER-QUALITY PERMITTING**

- A. Well Construction/Decommissioning or Soil Borings Permit: Before conducting soil boring or constructing a well, Principal Project Company must obtain a permit issued by SFDPH to construct or operate an environmental or geotechnical well or soil boring.
1. These wells include, but are not limited to, cone penetrometers, inclinometers, piezometers, cathodic wells, exploratory wells, extraction wells, recovery wells, monitoring wells, temporary wells, irrigation wells, industrial wells, dewatering wells, wick drains, hydropunch soil borings, and soil borings drilled for geotechnical or environmental purposes (whether or not groundwater is encountered). This information is not intended as a substitute for familiarity with applicable Laws and regulations.
  2. Principal Project Company shall use a driller with a C-57 state license.
  3. Principal Project Company shall contact the SFDPH Environmental Health Branch, Monitoring Well Section at least 15 Working Days in advance of drilling at (415) 252-3800.
- B. Underground Storage Tank (UST) Permit: Before modification, repair, removal and/or installation of fuel or chemical storage tanks, Principal Project Company shall obtain the written approval of the SFDPH, in compliance with Articles 21, 21A and 22 of the San Francisco Public Health Code, and its implementing regulations, compliance with applicable provisions of Chapters 6.7 and 6.75 of the California Health and Safety Code, Section 25280 et al. Contact the SFDPH Environmental Health Branch, HMUPA at (415) 252-3800.
1. If UST(s) are unexpectedly encountered during the course of construction, Principal Project Company shall stop Work at the site of the UST and alert City.

### **3.24 EMERGENCY OR BACKUP DIESEL GENERATOR HEALTH RISK REDUCTION PLAN**

- A. The Principal Project Company shall comply with the following:
1. Require all emergency or backup diesel generators to meet Tier 4 Final emission standards, reduce annual testing limit to 20 hours per year for each generator; or
  2. Require all emergency or backup diesel generators to be battery-powered; or
  3. Retain a qualified air quality consultant to develop a Diesel Generator Health Risk Reduction Plan. The Principal Project Company shall submit the plan to City Planning Department for review and approval prior to issuance of a permit for emergency diesel generators from the San Francisco Department of Building Inspection or the Bay Area Air

Quality Management District. The plan must include, for each diesel generator, a description of the anticipated venting location, engine specifications, and annual maintenance testing procedures. The plan must demonstrate with substantial evidence that annual maintenance testing will not result in the project's overall construction and operational cancer risk exceeding 7 per one million persons exposed at nearby offsite sensitive receptors.

- B. Principal Project Company shall be required to maintain records of the testing schedule for each diesel generator for the life of that generator and to provide this information for review to City Planning Department within three months of requesting such information.

### **3.25 FIXED MECHANICAL EQUIPMENT NOISE CONTROL FOR BUILDING OPERATIONS**

- A. Prior to approval of a building permit, the Principal Project Company shall submit documentation to City Planning Department, demonstrating with reasonable certainty that the building's fixed mechanical equipment (such as heating, ventilation and air conditioning [HVAC] equipment):

1. Meets the noise limits specified in sections 2909 (b) and 2909 (d) of the noise ordinance (i.e., an 8-dB increase above the ambient noise level at the property plane for commercial or mixed-use properties; and
2. Interior noise limits of 55 dBA and 45 dBA for daytime and nighttime hours inside any sleeping or living room in a nearby dwelling unit on a residential property assuming windows open, respectively).
3. Acoustical treatments required to meet the noise ordinance may include, but are not limited to:
4. Enclosing noise-generating mechanical equipment; and
5. Installing relatively quiet models of air handlers, exhaust fans, and other mechanical equipment; and
6. Using mufflers or silencers on equipment exhaust fans; and
7. Orienting or shielding equipment to protect noise-sensitive receptors (residences, hospitals, convalescent homes, schools, churches, hotels and motels, and sensitive wildlife habitat) to the greatest extent feasible; and
8. Increasing the distance between noise-generating equipment and noise-sensitive receptors; and/or
9. Placing barriers around the equipment to facilitate the attenuation of noise.

- B. Compliance with this fixed-mechanical equipment noise control for building operations standard requirement does not obviate the need for the equipment to demonstrate compliance with the noise ordinance throughout the lifetime of the project.

### **3.26 DESIGN MEASURES TO REDUCE PROJECT SPECIFIC WIND IMPACTS**

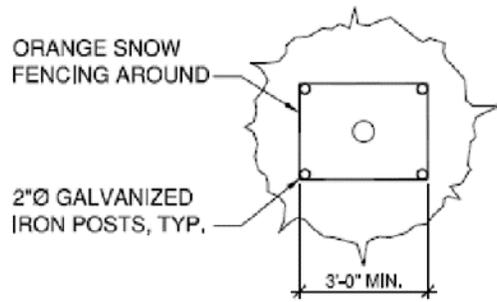

- A. The project sponsor team shall implement as many of the design measures identified in the wind impact mitigation report as needed to reduce the proposed project's or project variants' potential to create a new wind hazard or exacerbate an existing wind hazard in publicly accessible areas of substantial pedestrian use to less-than-significant levels, such as:

1. porous facades on portions of the north, east and west sides for natural ventilation as part of the heating, ventilation, and air conditioning strategy for the new transit facility at the second and third levels; and

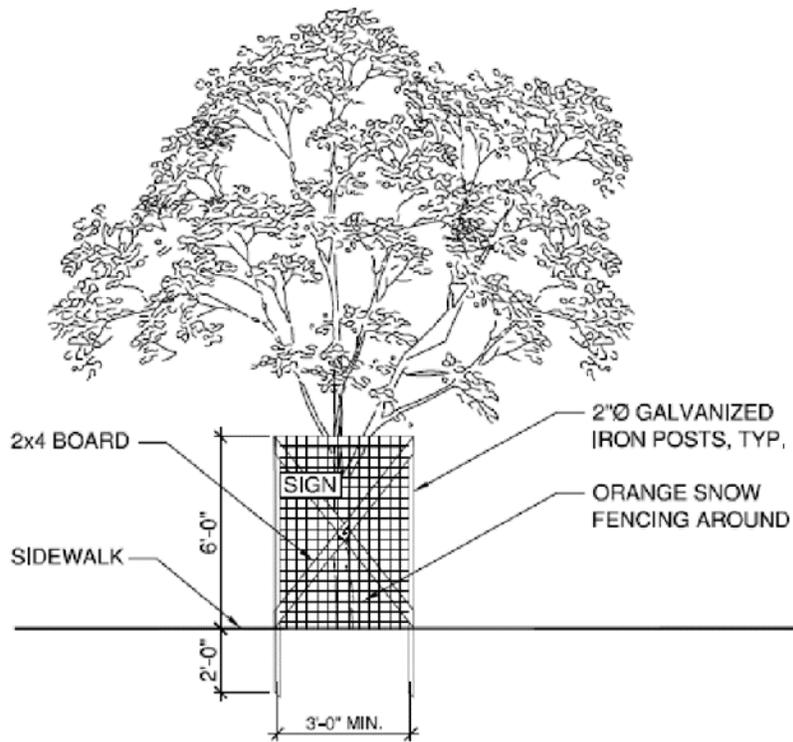

2. recessed building corner up to 12 feet in height at the southwest corner of proposed building near Bryant Street and Mariposa Street intersection; and
  3. vertical elevated screens on portions of the second and third levels of the west façade; and
  4. vertical wind screens at grade level on the adjacent Bryant Street sidewalk near the Bryant Street and Mariposa Street intersection; and
  5. additional on-site landscaping or off-site streetscape improvements and wind screens.
- B. If changes to the building design or massing are proposed after certification of the Final Environmental Impact Report,
1. additional wind analysis may be required to confirm the modified design does not result in any 9-hour wind hazard exceedances and to minimize 1-hour wind hazard exceedances.
  2. If City Planning Department determines that the modified design could result in wind hazard criterion exceedances (for example, due to the removal of one or more wind reducing features), the Principal Project Company shall retain a qualified wind consultant to prepare a wind analysis under the direction of the City Planning Department. The wind analysis may require a wind tunnel test and shall identify wind reduction measures needed to avoid 9-hour wind hazard exceedances and to minimize 1-hour wind hazard exceedances.
- C. The final wind impact mitigation report should not find that the project produces a net increase of the already identified wind hazard exceedances. City Planning Department shall approve the final list of wind reduction measures that the project sponsor team shall implement.

# MITIGATION MONITORING AND REPORTING PROGRAM: MITIGATION, IMPROVEMENT & PUBLIC WORKS STANDARD CONSTRUCTION MEASURES

<i>Record No.:</i>	Case No. 2019-021884ENV	<i>Block/Lot:</i>	3971/001
<i>Project Title:</i>	SFMTA Potrero Yard Modernization Project	<i>Lot Size:</i>	4.4 acres
<i>BPA Nos:</i>	Submittal pending	<i>Project Sponsor:</i>	Chris Lazaro, SFMTA, (415) 549-6572
<i>Zoning:</i>	Public (P) Use District 65-X Height and Bulk District	<i>Lead Agency:</i>	San Francisco Planning Department
		<i>Staff Contact:</i>	Jennifer McKellar, Planning – (628) 652-7563

Tables 1 and 3 below indicate when compliance with each mitigation and improvement measure must occur. Some mitigation and improvement measures span multiple phases. Substantive descriptions of each mitigation measure’s requirements are provided on the following pages in the Mitigation Monitoring and Reporting Program. The San Francisco Municipal Transportation Agency (SFMTA) is the project sponsor and property owner of the project site at 2500 Mariposa Street (Potrero Yard). Together the SFMTA and a private project co-sponsor (developer) are referenced below as the project sponsor team. In addition, pursuant to the May 11, 2023, memorandum regarding Public Works’ Authority for project delivery of the Potrero Yard Project and the May 31, 2020, attachment referenced therein, San Francisco Public Works assumes responsibility for environmental compliance, including applicable Standard Construction Measures in Tables 2 and 6 below.

### Period of Compliance

<b>Table 1: Adopted Mitigation Measure</b>	<b>Prior to the start of Construction*</b>	<b>During Construction**</b>	<b>Post-Construction or Operational</b>	<b>Compliance with MM completed?</b>
Mitigation Measure M-CR-1a: Documentation of Historical Resource	X			
Mitigation Measure M-CR-1b: Salvage Plan	X			
Mitigation Measure M-CR-1c: Interpretation of the Historical Resource	X			
Mitigation Measure M-CR-1d: Oral Histories	X

# MITIGATION MONITORING AND REPORTING PROGRAM

Table 4: MITIGATION MEASURES FOR THE POTRERO YARD MODERNIZATION PROJECT

MONITORING AND REPORTING PROGRAM <sup>1</sup>				
Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<b>MITIGATION MEASURES AGREED TO BY PROJECT SPONSOR TEAM</b>				
<b>HISTORIC ARCHITECTURAL/CULTURAL RESOURCES</b>				
<b>Mitigation Measure M-CR-1a: Documentation of Historical Resource (HRER Part II, Mitigation Measure 1)</b>				
<p>Prior to issuance of a demolition permit, the project sponsor team shall undertake Historic American Building/Historic American Landscape Survey-like (HABS/HALS-like) documentation of the building features. The documentation shall be undertaken by a professional who meets the Secretary of the Interior’s Professional Qualifications Standards for Architectural History, History, or Architecture (as appropriate) to prepare written and photographic documentation of the Potrero Trolley Coach Division Facility. The specific scope of the documentation shall be reviewed and approved by the Planning Department but shall include the following elements:</p> <p><b>Measured Drawings</b> – A set of measured drawings shall be prepared that depict the existing size, scale, and dimension of the historic resource. Planning Department staff will accept the original architectural drawings or an as-built set of architectural drawings (e.g., plans, sections, elevations). Planning Department staff will assist the consultant in determining the appropriate level of measured drawings.</p> <p><b>Historic American Buildings/Historic American Landscape Survey-Level Photographs</b> – Either Historic American Buildings/Historic American Landscape Survey (HABS/HALS) standard large-format or digital photography shall be used. The scope of the digital photographs shall be reviewed by Planning Department staff for concurrence, and all digital photography shall be conducted according to the latest National Park Service (NPS) standards. The</p>	<p>Project Sponsor Team and qualified consultant, at the direction of the ERO</p>	<p>Prior to issuance of excavation permit or commencement of construction</p>	<p>Planning Department preservation staff shall review and approve the documentation package</p>	<p>Considered complete upon completion of the Planning Department approved documentation provided to the repositories in their preferred format and the print-on-demand booklet is made available to the public, upon request</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>photography shall be undertaken by a qualified professional with demonstrated experience in HABS/HALS photography. Photograph views for the data set shall include contextual views; views of each side of the building and interior views, including any original interior features, where possible; oblique views of the building; and detail views of character-defining features. All views shall be referenced on a photographic key. This photographic key shall be on a map of the property and shall show the photograph number with an arrow to indicate the direction of the view. Historic photographs shall also be collected, reproduced, and included in the data set.</p> <p><b>HABS/HALS Historical Report</b> – A written historical narrative and report shall be provided in accordance with the HABS/HALS Historical Report Guidelines. The written history shall follow an outline format that begins with a statement of significance supported by the development of the architectural and historical context in which the structure was built and subsequently evolved. The report shall also include architectural description and bibliographic information.</p> <p><b>Video Recordation (HRER Part II, Mitigation Measure 3)</b> – Video recordation shall be undertaken before demolition or site permits are issued. The project sponsor team shall undertake video documentation of the affected historical resource and its setting. The documentation shall be conducted by a professional videographer, one with experience recording architectural resources. The documentation shall be narrated by a qualified professional who meets the standards for history, architectural history, or architecture (as appropriate) set forth by the Secretary of the Interior’s Professional Qualification Standards (36 Code of Federal Regulations Part 61). The documentation shall include as much information as possible—using visuals in combination with narration—about the materials, construction methods, current condition, historic use, and historic context of the historical resource. This mitigation measure would supplement the</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>traditional HABS/HALS documentation, and would enhance the collection of reference materials that would be available to the public and inform future research.</p> <p><b>Softcover Book</b> – A Print-on-Demand softcover book shall be produced that includes the content from the historical report, historical photographs, HABS/HALS photography, measured drawings, and field notes. The Print-on-Demand book shall be made available to the public for distribution. The project sponsor team shall transmit such documentation to the History Room of the San Francisco Public Library, San Francisco Architectural Heritage, the Planning Department, and the Northwest Information Center. The HABS/HALS documentation scope will determine the requested documentation type for each facility, and the project sponsor team will conduct outreach to identify other interested groups. All documentation will be reviewed and approved by the Planning Department’s staff before any demolition or site permit is granted for the affected historical resource.</p>				
<p><b>Mitigation Measure M-CR-1b: Salvage Plan (HRER Part II, Mitigation Measure 2)</b></p>				
<p>Prior to any demolition that would remove character-defining features, the project sponsor team shall consult with the planning department as to whether any such features may be salvaged, in whole or in part, during demolition/alteration. The project sponsor team shall make a good faith effort to salvage materials of historical interest to be utilized as part of the interpretative program.</p>	<p>Project Sponsor Team/qualified preservation consultant at the direction of the ERO</p>	<p>Prior to issuance of construction permits</p>	<p>Planning Department</p>	<p>Considered complete after salvage occur and interpretive program is complete</p>
<p><b>Mitigation Measure M-CR-1c: Interpretation of the Historical Resource (HRER Part II, Mitigation Measure 4)</b></p>				
<p>The project sponsor team shall facilitate the development of an interpretive program focused on the history of the project site. The interpretive program should be developed and implemented by a qualified professional with demonstrated experience in displaying information and graphics to the public in a visually interesting</p>	<p>Project Sponsor Team, construction contractors, and qualified consultant, at the</p>	<p>Prior to issuance of excavation permit or commencement of construction</p>	<p>Planning Department preservation staff shall review and approve the interpretive program plan</p>	<p>Considered complete upon the Planning Department’s approval and the Project Sponsor Team’s implementation of the interpretive program plan</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>manner, such as a museum or exhibit curator. This program shall be initially outlined in a proposal for an interpretive plan subject to review and approval by Planning Department staff. The proposal shall include the proposed format and the publicly-accessible location of the interpretive content, as well as high-quality graphics and written narratives. The proposal prepared by the qualified consultant describing the general parameters of the interpretive program shall be approved by Planning Department staff prior to issuance of the architectural addendum to the site permit. The detailed content, media, and other characteristics of such an interpretive program shall be approved by Planning Department staff prior to issuance of a Temporary Certificate of Occupancy.</p> <p>The interpretative program shall include but not be limited to the installation of permanent on-site interpretive displays or screens in publicly accessible locations. Historical photographs, including some of the large-format photographs required by Mitigation Measure M-CR-1a, may be used to illustrate the site’s history. The oral history program required by Mitigation Measure M-CR-1d will also inform the interpretative program.</p> <p>The primary goal is to educate visitors and future residents about the property’s historical themes, associations, and lost contributing features within broader historical, social, and physical landscape contexts. These themes would include but not be limited to the subject property’s historic significance for its association with the earliest years of San Francisco’s Municipal Railway, the United States’ first publicly owned street railway and for its distinctive characteristics as a car barn, for its post-Earthquake period of construction, and as the work of master Michael M. O’Shaughnessy.</p>	<p>direction of the ERO</p>			
<p>Mitigation Measure M-CR-1d: Oral Histories (HRER Part II, Mitigation Measure 5)</p>				

**MONITORING AND REPORTING PROGRAM<sup>1</sup>**

<b>Adopted Mitigation Measures</b>	<b>Implementation Responsibility</b>	<b>Mitigation Schedule</b>	<b>Monitoring / Reporting Responsibility</b>	<b>Monitoring Actions / Completion Criteria</b>
<p>The project sponsor team shall undertake an oral history project on the resource that may include interviews of people such as former SFMTA employees, or other community members who may offer informative historic perspectives on the history and significance of the resource. The project shall be conducted by a professional historian in conformance with the Oral History Association’s Principles and Best Practices (<a href="https://www.oralhistory.org/principles-and-best-practices-revised-2018/">https://www.oralhistory.org/principles-and-best-practices-revised-2018/</a>). In addition to transcripts of the interviews, the oral history project shall include a narrative project summary report containing an introduction to the project, a methodology description, and brief summaries of each conducted interview. Copies of the completed oral history project shall be submitted to the San Francisco Public Library, Planning Department, and other interested historical institutions. The oral history project shall also be incorporated into the interpretative program.</p>	<p>Project Sponsor Team and qualified consultant, at the direction of the ERO</p>	<p>Prior to issuance of excavation permit or commencement of construction</p>	<p>Planning Department preservation staff shall review and approve the documentation package</p>	<p>Considered complete upon the Planning Department’s approval and the Project Sponsor Team’s implementation of the interpretive program plan</p>
<p><b>Mitigation Measure M-TCR-1: Tribal Cultural Resources Preservation and/or Interpretive Program</b></p>				
<p>During ground-disturbing activities that encounter archeological resources, if the Environmental Review Officer (ERO) determines that a significant archeological resource is present, and if in consultation with the affiliated Native American tribal representatives, the ERO determines that the resource constitutes a tribal cultural resource (TCR) and that the resource could be adversely affected by the proposed project, the proposed project shall be redesigned so as to avoid any adverse effect on the significant tribal cultural resource, if feasible.</p> <p>If the ERO, in consultation with the project sponsor, determines that preservation-in-place of the TCR would be both feasible and effective, then the archeological consultant shall prepare an archeological resource preservation plan (ARPP). Implementation of</p>	<p>Project Sponsor Team, construction contractors, and qualified consultant, at the direction of the ERO</p>	<p>Consultation and planning starting upon discovery of a potential TCR during archeological testing or during construction excavations; interpretive program to be implemented prior to issuance of building occupancy permit</p>	<p>Environmental Review Officer (ERO) or designee</p>	<p>In the event of the discovery of a TCR, considered complete after implementation of the Planning Department approved interpretation program</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>the approved ARPP by the archeological consultant shall be required when feasible.</p> <p>If the ERO, in consultation with the affiliated Native American tribal representatives and the project sponsor, determines that preservation-in-place of the TCR is not a sufficient or feasible option, then the project sponsor shall implement an interpretive program of the TCR in consultation with affiliated Native American tribal representatives. An interpretive plan produced in consultation with affiliated Native American tribal representatives, at a minimum, and approved by the ERO, would be required to guide the interpretive program. The plan shall identify proposed locations for installations or displays, the proposed content and materials of those displays or installation, the producers or artists of the displays or installation, and a long-term maintenance program. The interpretive program may include artist installations, preferably by local Native American artists, oral histories with local Native Americans, artifacts displays and interpretation, and educational panels or other informational displays.</p>				
<b>NOISE</b>				
<b>Mitigation Measure M-NO-1: Construction Noise Control</b>				
<p>The SFMTA and private project co-sponsor and/or its contractors on SFMTA’s behalf (referred to below as project sponsor team) shall prepare construction noise control documentation as detailed below. Prior to issuance of any demolition or building permit, the project sponsor team shall submit a project-specific construction noise control plan to the Environmental Review Officer (ERO) or the ERO’s designee for approval. The construction noise control plan shall be prepared by a qualified acoustical engineer, with input from the construction contractor, and include all feasible measures to reduce construction noise. The construction noise control plan shall identify noise control measures to meet a performance target of</p>	<p>Project Sponsor Team, construction contractors, acoustical engineer</p>	<p>Prior to the issuance of construction permits; prior to the commencement of each construction stage; implementation of monitoring ongoing during construction</p>	<p>Environmental review officer or designee in Planning Department, Project Sponsor Team</p>	<p>Noise control plan approved by ERO/Planning Department prior to construction and considered complete upon submission of a noise monitoring report after each construction phase and completion of construction activities</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>construction activities not resulting in a noise level greater than 90 dBA at noise-sensitive receptors and 10 dBA above the ambient noise level at noise-sensitive receptors. The project sponsor team shall ensure that requirements of the construction noise control plan are included in contract specifications. If nighttime construction is required, the plan shall include specific measures to reduce nighttime construction noise. The plan shall also include measures for notifying the public of construction activities, complaint procedures, and a plan for monitoring construction noise levels in the event complaints are received. The construction noise control plan shall include the following measures to the degree feasible, or other effective measures, to reduce construction noise levels:</p> <ul style="list-style-type: none"> <li>• Use construction equipment that is in good working order, and inspect mufflers for proper functionality;</li> <li>• Select “quiet” construction methods and equipment (e.g., improved mufflers, use of intake silencers, engine enclosures);</li> <li>• Use construction equipment with lower noise emission ratings whenever possible, particularly for air compressors;</li> <li>• Prohibit the idling of inactive construction equipment for more than five minutes;</li> <li>• Locate stationary noise sources (such as compressors) as far from nearby noise-sensitive receptors as possible (including future onsite noise-sensitive receptors at the Phase 2 Bryant Street Housing under the phased construction scenarios for the Refined Project), muffle such noise sources, and construct barriers around such sources and/or the construction site.</li> <li>• Avoid placing stationary noise-generating equipment (e.g., generators, compressors) within noise-sensitive buffer areas (as determined by the acoustical engineer) immediately adjacent to neighbors (including future onsite noise-</li> </ul>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>sensitive receptors at the Phase 2 Bryant Street Housing under the phased construction scenarios for the Refined Project).</p> <ul style="list-style-type: none"> <li>• Enclose or shield stationary noise sources from neighboring noise-sensitive properties (including the future onsite noise-sensitive receptors at the Phase 2 Bryant Street Housing under the phased construction scenarios for the Refined Project) with noise barriers to the extent feasible. To further reduce noise, locate stationary equipment in pit areas or excavated areas, if feasible; and</li> <li>• Install temporary barriers, barrier-backed sound curtains and/or acoustical panels around working powered impact equipment and, if necessary, around the perimeter of active construction areas or phases. When temporary barrier units are joined together, the mating surfaces shall be flush with each other. Gaps between barrier units, and between the bottom edge of the barrier panels and the ground, shall be closed with material that completely closes the gaps, and dense enough to attenuate noise.</li> <li>• Under the phased construction scenarios for the Refined Project, develop strategies to reduce exposure to construction noise in coordination with future onsite noise-sensitive receptors at the Phase 2 Bryant Street Housing. Some options to reduce noise include limiting noise to Phase 2 Bryant Street receptors by delaying or limiting occupancy in units closest to the construction zone or notifying receptors of loud construction periods. These options should be explored as part of the noise control plan prepared by a qualified noise consultant and the construction contractor.</li> </ul> <p>The construction noise control plan shall include the following measures for notifying the public of construction activities, complaint procedures, and monitoring construction noise levels:</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<ul style="list-style-type: none"> <li>• Designate an on-site construction noise manager for the project;</li> <li>• Notify neighboring noise-sensitive receptors within 300 feet of the project construction area at least 30 days in advance of high-intensity noise-generating activities (e.g., pier drilling, pile driving, and other activities that may generate noise levels greater than 90 dBA at noise-sensitive receptors) about the estimated duration of the activity (including future onsite noise-sensitive receptors at the Phase 2 Bryant Street Housing under the phased construction scenarios for the Refined Project);</li> <li>• Post a sign onsite describing noise complaint procedures and a complaint hotline number that shall always be answered during construction;</li> <li>• Implement a procedure for notifying the planning department of any noise complaints within one week of receiving a complaint;</li> <li>• Establish a list of measures for responding to and tracking complaints pertaining to construction noise. Such measures may include the evaluation and implementation of additional noise controls at sensitive receptors (residences, hospitals, convalescent homes, schools, churches, hotels and motels, and sensitive wildlife habitat); and</li> <li>• Conduct noise monitoring (measurements) at the beginning of major construction phases (e.g., demolition, grading, excavation) and during high-intensity construction activities to determine the effectiveness of noise attenuation measures and, if necessary, implement additional noise control measures.</li> </ul> <p>The construction noise control plan shall include the following additional measures in the event of pile-driving activities:</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<ul style="list-style-type: none"> <li>When pile driving is to occur within 600 feet of a noise-sensitive receptor, implement “quiet” pile-driving technology (such as pre-drilling of piles, sonic pile drivers, auger cast-in-place, or drilled-displacement, or the use of more than one pile driver to shorten the total pile-driving duration [only if such measure is preferable to reduce impacts to sensitive receptors]) where feasible, in consideration of geotechnical and structural requirements and conditions;</li> <li>Where the use of driven impact piles cannot be avoided, properly fit impact pile driving equipment with an intake and exhaust muffler and a sound-attenuating shroud, as specified by the manufacturer; and</li> <li>Conduct noise monitoring (measurements) before, during, and after the pile-driving activity.</li> </ul>				
<p><b>Mitigation Measure M-NO-2: Vibration-Sensitive Equipment at 2601 Mariposa Street (KQED Building)</b></p>				
<p>Prior to construction, the SFMTA and private project co-sponsor and/or its contractors on SFMTA’s behalf (referred to below as project sponsor team) shall designate and make available a community liaison to respond to vibration complaints from building occupants at the KQED building, located at 2601 Mariposa Street. Contact information for the community liaison shall be posted in a conspicuous location so that it is clearly visible to building occupants most likely to be disturbed. Through the community liaison, the project sponsor team shall provide notification to property owners and occupants of 2601 Mariposa Street at least 10 days prior to construction activities involving equipment that can generate vibration capable of interfering with vibration-sensitive equipment, informing them of the estimated start date and duration of vibration-generating construction activities. Equipment types capable of generating such vibration include an impact pile</p>	<p>Project Sponsor Team, and qualified consultant, at the direction of the ERO</p>	<p>Prior to the issuance building and construction permits</p>	<p>Project sponsor, project acoustical engineer and Planning Department</p>	<p>Considered complete after construction activities are completed and after buildings and/or structures are remediated to their pre-construction condition at the conclusion of vibration-generating activity on the site, should any damage occur</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>driver, or similar equipment, operating within 250 feet of the building or a vibratory roller, or similar equipment, operating within 125 feet of the building. If feasible, the project sponsor team shall identify potential alternative equipment and techniques that could reduce construction vibration levels. Alternative equipment and techniques may include, but are not limited to:</p> <ul style="list-style-type: none"> <li>• pre-drilled piles,</li> <li>• caisson drilling,</li> <li>• oscillating or rotating pile installation,</li> <li>• jetting piles into place using a water injection at the tip of the pile could be substituted for driven piles, if feasible, based on soil conditions,</li> <li>• static rollers could be substituted for vibratory rollers in some cases.</li> </ul> <p>If concerns prior to construction or complaints during construction related to equipment interference are identified, the community liaison shall work with the project sponsor team and the affected building occupants to resolve the concerns such that the vibration control measures would meet a performance target of the 65 VdB vibration level threshold for vibration sensitive equipment, as set forth by Federal Transit Authority (FTA). To resolve concerns raised by building occupants, the community liaison shall convey the details of the complaint(s) to the project sponsor team, such as who shall implement specific measures to ensure that the project construction meets the performance target of 65 VdB vibration level for vibration sensitive equipment. These measures may include evaluation by a qualified noise and vibration consultant, scheduling certain construction activities outside the hours of operation or recording periods of specific vibration-sensitive equipment if feasible, and/or conducting ground-borne vibration monitoring to document that the project can meet the performance target of 65 VdB at specific distances and/or locations. Ground-borne</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
vibration monitoring, if appropriate to resolve concerns, shall be conducted by a qualified noise and vibration consultant.				
<b>Mitigation Measure NO-3: Fixed Mechanical Equipment Noise Control for Building Operations</b>				
<p>The SFMTA and a private project co-sponsor and/or its contractors on SFMTA’s behalf (referred to below as project sponsor team) shall prepare operational noise control documentation as detailed below. Prior to approval of a building permit, the project sponsor team shall submit documentation to the Environmental Review Officer (ERO) or the officer’s designee, demonstrating with reasonable certainty that the building’s fixed mechanical equipment (such as heating, ventilation and air conditioning [HVAC] equipment) meets the noise limits specified in sections 2909 (b) and 2909 (d) of the noise ordinance (i.e., an 8-dB increase above the ambient noise level at the property plane for commercial or mixed-use properties; and interior noise limits of 55 dBA and 45 dBA for daytime and nighttime hours inside any sleeping or living room in a nearby dwelling unit on a residential property assuming windows open, respectively). Acoustical treatments required to meet the noise ordinance may include, but are not limited to:</p> <ul style="list-style-type: none"> <li>• Enclosing noise-generating mechanical equipment;</li> <li>• Installing relatively quiet models of air handlers, exhaust fans, and other mechanical equipment;</li> <li>• Using mufflers or silencers on equipment exhaust fans;</li> <li>• Orienting or shielding equipment to protect noise-sensitive receptors (residences, hospitals, convalescent homes, schools, churches, hotels and motels, and sensitive wildlife habitat) to the greatest extent feasible;</li> <li>• Increasing the distance between noise-generating equipment and noise-sensitive receptors; and/or</li> </ul>	Project Sponsor Team and qualified consultant, at the direction of the ERO	Prior to the issuance building permit	Environmental Review Officer (ERO) or designee	Considered complete after receipt and acceptance of the appropriate documentation to the ERO

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<ul style="list-style-type: none"> <li>Placing barriers around the equipment to facilitate the attenuation of noise.</li> </ul> <p>Compliance with this fixed-mechanical equipment noise control for building operations standard requirement does not obviate the need for the equipment to demonstrate compliance with the noise ordinance throughout the lifetime of the project.</p>				
<b>AIR QUALITY</b>				
<b>Mitigation Measure M-AQ-1: Off-Road Construction Equipment Emissions Minimization</b>				
<p>The SFMTA and private project co-sponsor and/or its contractors on SFMTA’s behalf (referred to below as project sponsor team) shall comply with the following:</p> <p>A. Engine Requirements.</p> <ol style="list-style-type: none"> <li>All off-road equipment greater than or equal to 25 horsepower shall have engines that meet U.S. EPA or California Air Resources Board Tier 4 Final off-road emission standards.</li> <li>Where access to alternative sources of power is available, portable diesel engines shall be prohibited. If access to alternative sources of power is infeasible, portable diesel engines shall meet the requirements of Subsection (A)(1).</li> <li>Diesel engines, whether for off-road or on-road equipment, shall not be left idling for more than two minutes, at any location, except as provided in exceptions to the applicable state regulations regarding idling for off-road and on-road equipment (e.g., traffic conditions, safe operating conditions). The project sponsor team shall post legible and visible signs in English, Spanish, and Chinese, in designated queuing</li> </ol>	Project Sponsor Team, construction contractors	Prior to issuance of a construction permit; implementation ongoing during construction	Environmental Review Officer (ERO) or designee/ project sponsor	Considered complete upon Planning Department review and approval of Construction Emissions Minimization Plan, ongoing review and approval of biannual reports, and review and approval of final construction report

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>areas and at the construction site to remind operators of the two-minute idling limit.</p> <p>4. The project sponsor team shall instruct construction workers and equipment operators on the maintenance and tuning of construction equipment and require that such workers and operators properly maintain and tune equipment in accordance with manufacturer specifications.</p> <p>B. Waivers.</p> <p>1. The San Francisco Planning Department Environmental Review Officer (ERO) may waive the equipment requirements of Subsection (A)(1) if: a particular piece of off-road Tier 4 Final equipment is not regionally available, not technically feasible, or would not produce desired emissions reduction due to expected operating modes. In granting the waiver, the project sponsor team must demonstrate with substantial evidence that the project construction does not exceed the BAAQMD threshold for NOx (54 lbs/day) by resulting in a net increase of average daily NOx emissions greater than 4 pounds per day. The project sponsor team must also demonstrate with substantial evidence that the overall combined construction and operational excess cancer risk does not exceed 7 per 1 million persons exposed at nearby sensitive receptors.</p> <p>C. Construction Emissions Minimization Plan.</p> <p>1. Before starting onsite construction activities, the project sponsor team shall submit a Construction Emissions Minimization Plan (Plan) to the ERO for review and approval. The Plan shall state, in reasonable detail, how the project sponsor team will meet the requirements of Section A.</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>2. The Plan shall include estimates of the construction timeline by phase, with a description of each piece of off-road equipment required for every construction phase. The description may include, but is not limited to: equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel use and hours of operation.</p> <p>3. The project sponsor team shall ensure that all applicable requirements of the Plan have been incorporated into the contract specifications. The Plan shall include a certification statement that the project sponsor team agrees to comply fully with the Plan.</p> <p>4. The project sponsor team shall make the Plan available to the public for review onsite during working hours. The project sponsor team shall post at the construction site a legible and visible sign summarizing the Plan. The sign shall also state that the public may ask to inspect the Plan for the project at any time during working hours and shall explain how to request to inspect the Plan. The project sponsor team shall post at least one copy of the sign in a visible location on each side of the construction site facing a public right-of-way.</p> <p>D. Monitoring</p> <p>1. After start of construction activities, the project sponsor team shall submit biannual reports to the ERO documenting compliance with the Plan. After completion of construction activities and prior to receiving a final certificate of occupancy, the project sponsor team shall submit to the ERO a final report summarizing construction activities, including the start and end dates and duration of each construction phase, and the specific information required in the Plan.</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

<p><b>Mitigation Measure M-AQ-3: Emergency Diesel Generator Health Risk Reduction Plan</b></p> <p>The SFMTA and private project co-sponsor and/or its contractors on SFMTA’s behalf (referred to below as the project sponsor team) shall comply with the following:</p> <ol style="list-style-type: none"> <li>1. Require all emergency diesel generators to meet Tier 4 Final emission standards and reduce annual testing limit to 20 hours per year for each generator; or</li> <li>2. Require all emergency generators to be battery-powered; or</li> <li>3. The project sponsor team shall retain a qualified air quality consultant to develop an Emergency Diesel Generator Health Risk Reduction Plan. The project sponsor team shall submit the plan to the San Francisco Planning Department Environmental Review Officer (ERO) for review and approval prior to issuance of a permit for emergency diesel generators from the San Francisco Department of Building Inspection or the Bay Area Air Quality Management District. The plan must include, for each emergency diesel generator, a description of the anticipated venting location, engine specifications, and annual maintenance testing procedures. The plan must demonstrate with substantial evidence that annual maintenance testing will not result in the project’s overall construction and operational cancer risk exceeding 7 per one million persons exposed at nearby offsite sensitive receptors.</li> </ol> <p>Additionally, the operator of the facility at which the generators are located (including the private project co-sponsor as applicable) shall be required to maintain records of the testing schedule for each emergency diesel generator for the life of that generator and to</p>	<p>Project Sponsor Team and construction contractor</p>	<p>Prior to issuance of a permit for emergency diesel generator</p>	<p>Project Sponsor Team, facility maintenance contractor, and the Planning Department</p>	<p>Considered complete upon Planning Department review and approval of Emergency Diesel Generator Health Risk Reduction Plan</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
provide this information for review to the planning department within three months of requesting such information.				
<b>WIND</b>				
<b>Mitigation Measure M-WI-1(a): Design Measures to Reduce Project-Specific Wind Impacts</b>				
<p>The project sponsor team shall retain a qualified wind consultant to prepare, in consultation with the San Francisco Planning Department (planning department), a wind impact mitigation report that identifies design measures to reduce the project’s wind impacts in the project scenario. Prior to certification of the Final Environmental Impact Report, the project sponsor team shall submit the wind impact mitigation report to the planning department for its final review and approval. The wind impact mitigation report shall incorporate updated information on the building design based on a list of potential wind reduction measures identified below, along with the estimated effectiveness of each measure to reduce the identified off-site wind hazards.</p> <ul style="list-style-type: none"> <li>• Porous façades on portions of the north, east and west sides for natural ventilation as part of the heating, ventilation, and air conditioning strategy for the new transit facility at the second and third levels</li> <li>• Recessed building corner up to 12 feet in height at the southwest corner of proposed building near Bryant/Mariposa intersection</li> <li>• Vertical elevated screens on portions of the second and third levels of the west façade (Bryant Street)</li> <li>• Vertical wind screens at grade level on the adjacent Bryant Street sidewalk near the Bryant/Mariposa intersection</li> </ul> <p>Such wind reduction design measures may include additional on-site landscaping, or equivalent wind-reducing features; and off-site wind reduction measures such as landscaping, streetscape</p>	Project Sponsor Team/qualified consultant	Prior to completion of the environmental review	Project Sponsor Team, and the Planning Department	Completion of and acceptance of the wind impact mitigation report by the Planning Department

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>improvements or other wind-reducing features, such as wind screens.</p> <p>The project sponsor team shall implement as many of the design measures identified in the wind impact mitigation report as needed to reduce the proposed project’s or project variants’ potential to create a new wind hazard or exacerbate an existing wind hazard in publicly accessible areas of substantial pedestrian use to less-than-significant levels. The final wind impact mitigation report should not find that the project produces a net increase of the already identified wind hazard exceedances. The planning department shall approve the final list of wind reduction measures that the project sponsor team shall implement.</p>				
<p><b>Mitigation Measure M-WI-1(b): Additional Wind Testing</b></p>				
<p>If changes to the building design or massing are proposed after certification of the Final Environmental Impact Report, additional wind analysis may be required to confirm the modified design does not result in any 9-hour wind hazard exceedances and to minimize 1-hour wind hazard exceedances.</p> <p>If the planning department determines that the modified design could result in wind hazard criterion exceedances (for example, due to the removal of one or more wind reducing features), the project sponsor team shall retain a qualified wind consultant to prepare a wind analysis under the direction of the planning department. The wind analysis may require a wind tunnel test and shall identify wind reduction measures needed to avoid 9-hour wind hazard exceedances and to minimize 1-hour wind hazard exceedances.</p>	<p>Project Sponsor Team /qualified consultant</p>	<p>Prior to completion of the environmental review</p>	<p>Project Sponsor Team, and the Planning Department</p>	<p>Completion of and acceptance of the wind impact mitigation report by the Planning Department</p>
<p><b>GEOLOGY AND SOILS</b></p>				
<p><b>Mitigation Measure M-GE-6a: Inadvertent Discovery of Paleontological Resources</b></p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>Worker Awareness Training - Prior to commencing construction, and ongoing throughout ground disturbing activities (e.g., excavation, utility installation, the project sponsor and/or their designee shall ensure that all project construction workers are trained on the contents of the Paleontological Resources Alert Sheet, as provided by the Planning Department. The Paleontological Resources Alert Sheet shall be prominently displayed at the construction site during ground disturbing activities for reference regarding potential paleontological resources.</p> <p>In addition, the project sponsor shall inform the contractor and construction personnel of the immediate stop work procedures and other procedures to be followed if bones or other potential fossils are unearthed at the project site. Should new workers that will be involved in ground disturbing construction activities begin employment after the initial training has occurred, the construction supervisor shall ensure that they receive the worker awareness training as described above.</p> <p>The project sponsor shall complete the standard form/affidavit confirming the timing of the worker awareness training to the Environmental Review Officer (ERO). The affidavit shall confirm the project's location, the date of training, the location of the informational handout display, and the number of participants. The affidavit shall be transmitted to the ERO within five (5) business days of conducting the training.</p> <p>Paleontological Resource Discoveries - In the event of the discovery of an unanticipated paleontological resource during project construction, ground disturbing activities shall temporarily be halted within 25 feet of the find until the discovery is examined by a qualified paleontologist as recommended by the Society of</p>	<p>Project Sponsor Team, construction contractors, at the direction of the ERO</p>	<p>Prior to construction commencement</p>	<p>Project Sponsor Team and the Planning Department</p>	<p>Submission of evidence of worker awareness training and distribution of alert sheet to the satisfaction of the Planning Department, including proper adherence to procedures if a resource is encountered</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>Vertebrate Paleontology standards (SVP 2010) and Best Practices in Mitigation Paleontology (Murphey et al. 2019). Work within the sensitive area shall resume only when deemed appropriate by the qualified paleontologist in consultation with the ERO.</p> <p>The qualified paleontologist shall determine: 1) if the discovery is scientifically significant; 2) the necessity for involving other responsible or resource agencies and stakeholders, if required or determined applicable; and 3) methods for resource recovery. If a paleontological resource assessment results in a determination that the resource is not scientifically important, this conclusion shall be documented in a Paleontological Evaluation Letter to demonstrate compliance with applicable statutory requirements (e.g., Federal Antiquities Act of 1906, CEQA Guidelines Section 15064.5, California Public Resources Code Chapter 17, Section 5097.5, Paleontological Resources Preservation Act 2009). The Paleontological Evaluation Letter shall be submitted to the ERO for review within 30 days of the discovery.</p> <p>If the qualified paleontologist determines that a paleontological resource is of scientific importance, and there are no feasible measures to avoid disturbing this paleontological resource, the qualified paleontologist shall prepare a Paleontological Mitigation Program. The mitigation program shall include measures to fully document and recover the resource of scientific importance. The qualified paleontologist shall submit the mitigation program to the ERO for review and approval within 10 business days of the discovery. Upon approval by the ERO, ground disturbing activities in the project area shall resume and be monitored as determined by the qualified paleontologist for the duration of such activities.</p> <p>The mitigation program shall include: 1) procedures for construction monitoring at the project site; 2) fossil preparation and</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>identification procedures; 3) curation of paleontological resources of scientific importance into an appropriate repository; and 4) preparation of a Paleontological Resources Report (report or paleontology report) at the conclusion of ground disturbing activities. The report shall include dates of field work, results of monitoring, fossil identifications to the lowest possible taxonomic level, analysis of the fossil collection, a discussion of the scientific significance of the fossil collection, conclusions, locality forms, an itemized list of specimens, and a repository receipt from the curation facility. The project sponsor shall be responsible for the preparation and implementation of the mitigation program, in addition to any costs necessary to prepare and identify collected fossils, and for any curation fees charged by the paleontological repository. The paleontology report shall be submitted to the ERO for review within 30 business days from conclusion of ground disturbing activities, or as negotiated following consultation with the ERO.</p>				
<p><b>Mitigation Measure M-GE-6b: Preconstruction Paleontological Evaluation and Monitoring Plan during Construction</b></p>				
<p>The project sponsor shall engage a qualified paleontologist to develop a site-specific monitoring plan prior to commencing soil-disturbing activities at the project site. The Preconstruction Paleontological Monitoring Plan would determine project construction activities requiring paleontological monitoring based on those may affect sediments with moderate sensitivity for paleontological resources. Prior to issuance of any demolition permit, the project sponsor shall submit the Preconstruction Paleontological Monitoring Plan to the ERO for approval.</p> <p>At a minimum, the plan shall include:</p> <ol style="list-style-type: none"> <li>1. Project Description</li> <li>2. Regulatory Environment – outline applicable federal, state and local regulations</li> </ol>	<p>Project Sponsor Team, construction contractors, and qualified consultant, at the direction of the ERO</p>	<p>Prior to construction commencement</p>	<p>Project Sponsor Team and the Planning Department</p>	<p>Completion of and acceptance of the Preconstruction Paleontological Evaluation by the Planning Department</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>3. Summary of Sensitivity Classification(s)</p> <p>4. Research Methods, including but not limited to:</p> <p>4.a. Field studies conducted by the approved paleontologist to check for fossils at the surface and assess the exposed sediments.</p> <p>4.b. Literature Review to include an examination of geologic maps and a review of relevant geological and paleontological literature to determine the nature of geologic units in the project area.</p> <p>4.c. Locality Search to include outreach to the University of California Museum of Paleontology in Berkeley.</p> <p>5. Results: to include a summary of literature review and finding of potential site sensitivity for paleontological resources; and depth of potential resources if known.</p> <p>6. Recommendations for any additional measures that could be necessary to avoid or reduce any adverse impacts to recorded and/or inadvertently discovered paleontological resources of scientific importance. Such measures could include:</p> <p>6.a. Avoidance: If a known fossil locality appears to contain critical scientific information that should be left undisturbed for subsequent scientific evaluation.</p> <p>6.b. Fossil Recovery: If isolated small, medium- or large-sized fossils are discovered during field surveys or construction monitoring, and they are determined to be scientifically significant, they should be recovered. Fossil recovery may involve collecting a fully exposed fossil from the ground surface, or may involve a systematic excavation, depending upon the size and complexity of the fossil discovery.</p> <p>6.c. Monitoring: Monitoring involves systematic inspections of graded cut slopes, trench sidewalls, spoils piles, and other types of construction</p>				

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Mitigation Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>excavations for the presence of fossils, and the fossil recovery and documentation of these fossils before they are destroyed by further ground disturbing actions. Standard monitoring is typically used in the most paleontologically sensitive geographic areas/geologic units (moderate, high and very high potential); while spot-check monitoring is typically used in geographic areas/geologic units of moderate or unknown paleontological sensitivity (moderate or unknown potential).</p> <p>6.d. Data recovery and reporting: Fossil and associated data discovered during soils disturbing activities should be treated according to professional paleontological standards and documented in a data recovery report. The plan should define the scope of the data recovery report.</p> <p>The consultant shall document the monitoring conducted according to the monitoring plan and any data recovery completed for significant paleontological resource finds discovered, if any. Plans and reports prepared by the consultant shall be considered draft reports subject to revision until final approval by the ERO. The final monitoring report and any data recovery report shall be submitted to the ERO prior to the certificate of occupancy.</p>

Table 5: IMPROVEMENT MEASURES FOR THE POTRERO YARD MODERNIZATION PROJECT

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Improvement Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<b>IMPROVEMENT MEASURES AGREED TO BY PROJECT SPONSOR TEAM</b>				
<b>TRANSPORTATION</b>				
Improvement Measure I-TR-A: Construction Management Plan – Additional Measures				
<p>As part of the project’s construction management plan, the SFMTA and a private project co-sponsor and/or its contractors on SFMTA’s behalf (referred to as project sponsor team) will require additional measures to further minimize disruptions to people walking and bicycling, transit, and emergency vehicles during project construction: The additional measures include:</p> <p><b>Carpool, Bicycle, Walk, and Transit Access for Construction Workers</b>—Carpool, Bicycle, Walk, and Transit Access for Construction Workers—To minimize parking demand and vehicle trips associated with construction workers, the construction contractor will include as part of the Construction Management Plan methods to encourage carpooling, bicycle, walk, and transit access to the project site by construction workers. These methods could include providing secure bicycle parking spaces, participating in free-to-employee and employer ride matching program from www.511.org, participating in emergency ride home program through the City of San Francisco (www.sferh.org), and providing transit information to construction workers.</p> <p><b>Project Construction Updates for Adjacent Businesses and Residents</b>— To minimize construction impacts on access to nearby residences and businesses, the project sponsor team will provide nearby residences and adjacent businesses with regularly updated information regarding project construction, including construction activities, peak construction vehicle activities, travel lane closures,</p>	<p>Project Sponsor Team, including SFMTA regulatory teams, and construction contractor</p>	<p>Prior to the issuance of construction permits; implementation ongoing during construction with construction updates provided weekly; Active Monitoring of Detours as needed</p>	<p>Project Sponsor Team, SFMTA (in its regulatory capacity)</p>	<p>Considered complete upon the submittal and approval of the Construction Management Plan to the SFMTA (in its regulatory capacity)</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Improvement Measures	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>and parking lane and sidewalk closures (e.g., via the project’s website). At regular intervals to be defined in the construction management plan, a regular email notice will be distributed by the project sponsor team that would provide current construction information of interest to neighbors, as well as contact information for specific construction inquiries or concerns.</p>				
<p><b>Improvement Measure I-TR-B: Driveway and Loading Operations Plan (DLOP)</b></p>				
<p>The project sponsor team (including joint development project sponsor as applicable) will be required to prepare and implement a Driveway and Loading Operations Plan (DLOP). The DLOP will be prepared by the private project co-sponsor, in coordination with the SFMTA, and submitted as part of the application for the first temporary occupancy permit. The DLOP will include provisions to manage loading activities and driveway operations associated with the below-grade onsite loading spaces; provisions for assessing on-street commercial and passenger loading supply and protocol for expanding on-street supply, if needed; provisions for trash/recycling/compost truck access and collection operations; provisions for residential move-in and move-out operations; provisions for scheduling Muni deliveries using the onsite loading facilities; and provisions for accommodating recurring deliveries such as UPS, Federal Express, and USPS within the onsite loading facilities.</p> <p>The intent of the DLOP is to reduce potential conflicts between passenger and freight loading and transit operations, and between passenger and freight loading activities and people walking and bicycling, and other vehicles in the project vicinity, as well as to maximize reliance on onsite facilities to accommodate freight loading demand.</p>	<p>Project Sponsor Team</p>	<p>Project Sponsor Team to submit Loading Management Plan to ERO prior to the issuance of any certificate of occupancy for the proposed project.</p>	<p>ERO, Project Sponsor Team or successor owner/ manager of residential building</p>	<p>Considered complete upon ERO approval of Loading Management Plan; Ongoing monitoring to continue indefinitely</p>

**Table 6: PUBLIC WORKS STANDARD CONSTRUCTION MEASURES FOR THE POTRERO YARD MODERNIZATION PROJECT**

Public Works’ Regulatory Affairs division will ensure the Standard Construction Measures are included in construction specifications and contracts. The planning department environmental monitoring team will confirm the public works standard construction measures have been incorporated into the final project agreement with the project sponsor team.

<b>MONITORING AND REPORTING PROGRAM<sup>1</sup></b>				
<b>Adopted Public Works Standard Construction Measure</b>	<b>Implementation Responsibility</b>	<b>Mitigation Schedule</b>	<b>Monitoring / Reporting Responsibility</b>	<b>Monitoring Actions / Completion Criteria</b>
<b>PUBLIC WORKS STANDARD CONSTRUCTION MEASURES AGREED TO BY PROJECT SPONSOR TEAM</b>				
<b>Public Works Standard Construction Measure #1, Seismic and Geotechnical Studies (Geology and Soils)</b>				
The project manager shall ensure that projects that may potentially be affected by existing soil, slope and/or geologic conditions at the project site will be screened for liquefaction, subsidence, landslide, fault displacement, and other geological hazards at the project site, and will be engineered and designed as necessary to minimize risks to safety and reliability due to such hazards. As necessary, geotechnical investigations will be performed.	Project Sponsor Team, construction contractors	Prior to construction	Project Sponsor Team, Planning Department, Public Works Regulatory Affairs	Considered complete upon submission of geotechnical investigations, if applicable
<b>Public Works Standard Construction Measure #2, Air Quality</b>				
All projects will comply with the Construction Dust Control Ordinance. Major construction projects that are estimated to require 20 or more days of cumulative work within the Air Pollutant Exposure Zone must comply with the additional clean construction requirements of the Clean Construction Ordinance.	Project Sponsor Team, construction contractors	Ongoing during construction	Project Sponsor Team, Planning Department, Public Works Regulatory Affairs	Considered complete upon submission of a Site-Specific Dust Control Plan for the review and approval of the Department of Public Health
<b>Public Works Standard Construction Measure #3, Water Quality</b>				
All projects will implement erosion and sedimentation controls to be tailored to the project site, such as fiber rolls and/or gravel bags around storm drain inlets, installation of silt fences, and other such measures sufficient to prevent discharges of sediment and other pollutants to storm drains and all surface waterways, such as San Francisco Bay, the Pacific Ocean, water supply reservoirs, wetlands, swales, and streams. As required based on project location and size,	Project Sponsor Team, construction contractors	Ongoing during construction	Project Sponsor Team, Planning Department, Public Works Regulatory Affairs	Considered complete upon Project Sponsor Team’s enforcement of water quality considerations

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Public Works Standard Construction Measure	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>a Stormwater Control Plan (in most areas of San Francisco) or a Stormwater Pollution Prevention Plan (SWPPP) (in certain areas of San Francisco) will be prepared. If uncontaminated groundwater is encountered during excavation activities, it will be discharged in compliance with applicable water quality standards and discharge permit requirements.</p>				
<p><b>Public Works Standard Construction Measure #4, Traffic</b></p>				
<p>All projects will implement traffic control measures sufficient to maintain traffic and pedestrian circulation on streets affected by construction of the project. The measures will also, at a minimum, be consistent with the requirements of San Francisco Municipal Transportation Agency (SFMTA)’s Blue Book. Traffic control measures may include, but not be limited to, flaggers and/or construction warning sign age of work ahead; scheduling truck trips during non-peak hours to the extent feasible; maintaining access to driveways, private roads, and off-street commercial loading facilities by using steel trench plates or other such method; and coordination with local emergency responders to maintain emergency access. Any temporary rerouting of transit vehicles or relocation of transit facilities would be coordinated with SFMTA Muni Operations.</p>	<p>Project Sponsor Team, construction contractors</p>	<p>Ongoing during construction</p>	<p>Project Sponsor Team; SFMTA Muni Operations, Public Works Regulatory Affairs</p>	<p>Considered complete upon the submittal and approval of the Construction Management Plan to the SFMTA</p>
<p><b>Public Works Standard Construction Measure #5, Noise</b></p>				
<p>All projects will comply with local noise ordinances resulting construction noise. Public Works shall undertake measures to minimize noise disruption to nearby neighbors and sensitive receptors during construction. These efforts could include using best available noise control technologies on equipment (i.e., mufflers, ducts, and acoustically attenuating shields), locating stationary noise sources (i.e., pumps and generators) away from sensitive receptors, erecting temporary noise barriers, and other such means.</p>	<p>Project Sponsor Team, construction contractors</p>	<p>Ongoing during construction</p>	<p>Project Sponsor Team, Planning Department, Public Works Regulatory Affairs</p>	<p>Considered complete upon Project Sponsor enforcement of local noise ordinances</p>

**MONITORING AND REPORTING PROGRAM<sup>1</sup>**

<b>Adopted Public Works Standard Construction Measure</b>	<b>Implementation Responsibility</b>	<b>Mitigation Schedule</b>	<b>Monitoring / Reporting Responsibility</b>	<b>Monitoring Actions / Completion Criteria</b>
<b>Public Works Standard Construction Measure #6, Hazardous Materials</b>				
Projects that involve excavation of 50 cubic yards of soil in the Maher Zone will comply with the Maher Ordinance. Projects on sites that are not currently located in the Maher Zone but have the potential to contain hazardous materials in soil and/or groundwater will be referred to the Department of Public Health as newly identified Maher sites.	Project Sponsor Team, construction contractors	Ongoing during construction	Project Sponsor Team, Planning Department, Public Works Regulatory Affairs	Considered complete upon Project Sponsor enforcement of Maher ordinance
<b>Public Works Standard Construction Measure #7, Biological Resources</b>				
Projects will comply with all local, state, and federal requirements for surveys, analysis, and protection of biological resources (e.g., Migratory Bird Treaty Act, Federal and State Endangered Species Acts, etc.). The project site and the immediately surrounding area will be screened to determine whether biological resources may be affected by construction. If biological resources are present, a qualified biologist will carry out a survey of the project site to note the presence of general biological resources and to identify whether habitat for special-status species and/or migratory birds is present. If necessary, measures will be implemented to protect biological resources, such as installing wildlife exclusion fencing, establishing work buffer zones, installing bird deterrents, having a qualified biologist conduct monitoring, and other such applicable measures. Tree removal will also comply with any applicable tree protection ordinance.	Project Sponsor Team, construction contractors	Ongoing during construction	Project Sponsor Team, Planning Department, Public Works Regulatory Affairs	Considered complete upon Project Sponsor enforcement of biological considerations
<b>Public Works Standard Construction Measure #8, Visual and Aesthetic Considerations, Project Site</b>				
All project sites will be maintained in a clean and orderly state. Construction staging areas will be sited away from public view, and on currently paved or previously disturbed areas, where possible.	Project Sponsor Team, construction contractors	Ongoing during construction	Project Sponsor Team, Planning Department, Public Works Regulatory Affairs	Considered complete upon Project Sponsor Team's enforcement of visual considerations

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Public Works Standard Construction Measure	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>Nighttime lighting will be directed away from residential areas and have shields to prevent light spillover effects. Upon project completion, project sites on City-owned lands will be returned to their general pre-project condition, including re-grading of the site and re-vegetation or re-paving of disturbed areas to the extent this is consistent with Public Works Bureau of Urban Forestry Policy and San Francisco Code. Project sites on non-City land will be restored to their general pre-project condition so that the owner may return them to their prior use, unless otherwise arranged with the property owner.</p>				
<p><b>Public Works Standard Construction Measure #9, Cultural Resources</b></p>				
<p>All projects that will alter a building or structure, produce vibrations, or include soil disturbance will be screened to assess whether cultural resources are or may be present and could be affected, as detailed below.</p> <p>Soil is defined as native earthen deposits or introduced earthen fill. Soil does not include materials that were previously introduced as part of roadway pavement section including asphalt concrete wearing roadway base and subbase.</p> <p><i>Archeological Resources.</i> The EP Archeologist has determined that Standard Archeological Measure III (Testing/Data Recovery) shall be implemented by Public Works to protect and/or treat significant archeological resources identified as being present within the site and potentially affected by the project (see Attachment H: Public Works Archeological Measure III (Testing / Data Recovery)).</p> <ol style="list-style-type: none"> <li>Public Works shall implement the EP Archeologist's recommendations prior to and/or during project construction consistent with Standard Archeological Measure III and shall consult with the EP Archeologist in</li> </ol>	<p>Project Sponsor Team, construction contractors</p>	<p>Prior to issuance of a construction permit</p>	<p>Project Sponsor Team, the EP Archeologist staff, Public Works and the ERO</p>	<p>Considered complete upon compliance with Standard Archeological Measure III (Testing/Data Recovery) requirements</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Public Works Standard Construction Measure	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>selecting a qualified archeological consultant from the EP Archeological Resources Consultant Pool, as needed, to implement these measures.</p> <p>2. Soil-disturbing activities in archeologically sensitive areas, as identified through the above process, will not begin until preconstruction archeological measures required by the EP Archeologist (e.g., preparation of an Archeological Testing Plan, Archeological Treatment Plan, and/or an Archeological Data Recovery Plan) have been implemented.</p>				
<p><b>Public Works Standard Construction Measure #9, Cultural Resources</b></p>				
<p>All projects that will alter a building or structure, produce vibrations, or include soil will be screened to assess whether cultural resources are or may be present disturbance and could be affected, as detailed below.</p> <p><i>Historic (Built Environment) Resources.</i> Where construction will take place in proximity to a building or structure identified as a significant historical resource but would not otherwise directly affect it, Public Works will implement protective measures, such as but not limited to, the erection of temporary construction barriers to ensure that inadvertent impacts to such buildings or structures are avoided. These measures shall require the development of a Construction Best Practices for Historical Resources Plan and a plan outlining the Construction Monitoring for Historical Resources Program to be reviewed and approved by CCSF Planning Department Preservation staff.</p> <p>If a project includes or is directly adjacent to historic buildings or structures susceptible to vibration (such as but not limited to unreinforced masonry, earthen construction, lathe and plaster, or fragile architectural ornamentation) as determined in consultation with CCSF Planning Department Preservation staff, Public Works will determine if vibrations associated with proposed construction</p>	<p>Project Sponsor Team, construction contractors</p>	<p>Prior to issuance of a construction permit</p>	<p>Project Sponsor Team, the EP Preservation staff, Public Works and the ERO</p>	<p>Considered complete upon compliance with requirements</p>

MONITORING AND REPORTING PROGRAM<sup>1</sup>

Adopted Public Works Standard Construction Measure	Implementation Responsibility	Mitigation Schedule	Monitoring / Reporting Responsibility	Monitoring Actions / Completion Criteria
<p>activities has the potential to cause damage to such buildings or structures. Generally, vibration below 0.12 inches per second peak particle velocity does not have the potential to damage sensitive buildings or structures. A vibration study may be necessary to determine if such vibration levels will occur. If Public Works determines in consultation with CCSF Planning Department Preservation staff that vibration damage may occur, Public Works will engage a qualified historic architect or historic preservation professional to document and photograph the preconstruction condition of the building and prepare a plan for monitoring the building during construction. The monitoring plan will be submitted to and approved by CCSF Planning Department Preservation Planner prior to the beginning of construction and will be implemented during construction. The monitoring plan will identify how often monitoring will occur, who will undertake the monitoring, reporting requirements on vibration levels, reporting requirements on damage to adjacent historical resources during construction, reporting procedures to follow if such damage occurs, and the scope of the preconstruction survey and post-construction conditions assessment.</p> <p>If any damage to a historic building or structure occurs, Public Works will modify activities to minimize further vibration. If any damage occurs, the building will be repaired following the Secretary of the Interior's Standards for the Treatment of Historic Properties under the guidance of a qualified historic architect or historic preservation professional in consultation with CCSF Department Preservation Planner.</p>				

<sup>1</sup> Definitions of MMRP Column Headings:

Adopted Mitigation, Improvement or Public Works Standard Construction Measures: Full text of the mitigation measures, improvement measures or Public Works Standard Construction Measures copied verbatim from the final CEQA document.

Implementation Responsibility: Entity who is responsible for implementing the mitigation measures, improvement measures or Public Works Standard Construction Measures. In most cases this is the project sponsor and/or project's sponsor's contractor/consultant and at times under the direction of the planning department.

Mitigation Schedule: Identifies milestones for when the actions in the mitigation measure, improvement measure or Public Works Standard Construction Measure need to be implemented.

Monitoring/Reporting Responsibility: Identifies who is responsible for monitoring compliance with the mitigation measure, improvement measure or Public Works Standard Construction Measure and any reporting responsibilities. In most cases it is the Planning Department who is responsible for monitoring compliance. If a department or agency other than the planning department is identified as responsible for monitoring, there should be an expressed agreement between the planning department and that other department/agency. In most cases the project sponsor, their contractor, or consultant are responsible for any reporting requirements.

Monitoring Actions/Completion Criteria: Identifies the milestone at which the mitigation measure, improvement measure or Public Works Standard Construction Measure is considered complete. This may also identify requirements for verifying compliance.

## SECTION 01 35 44 - HAZARDOUS BUILDING MATERIALS SCOPE OF WORK

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. Principal Project Company shall perform Hazardous Materials abatement, removal, and remediation before any demolition Work and for any disturbance of areas on the Project Site that contain Hazardous Materials.
- B. This Section 01 35 44 includes the scope of work for abatement and/or removal of Hazardous Materials, including Hazardous Waste and contaminated materials, environmental training requirements, minimum qualifications to perform Work related to Hazardous Materials, applicable Laws, Project requirements, and handling procedures required as part of the D&C Work.
- C. Many of the materials and items of equipment used to construct the improvements and facilities at the Project Site contain substances recognized by the State of California as being carcinogenic or reproductive toxins. Such hazardous, contaminated, and non-Hazardous Materials include, and are not limited to, Hazardous Materials, non-Hazardous Materials, soils, heavy metals, asbestos; serpentine rock (which may contain natural asbestos); soils with naturally-occurring asbestos; lead-containing paints and coatings; lead sheeting; mercury; debris, mold and fungi; bacterial/biological contamination. Materials that may be encountered include polychlorinated biphenyl (PCB) ballasts, mercury containing lamps; asbestos; lead and other Hazardous Materials.
- D. No environmental or Hazardous Materials sampling or analysis shall be conducted without written permission from the SAR group within City Public Works Department. This does not include Principal Project Company's obligation for any personnel air monitoring of its employees.
- E. ENVIRONMENTAL TRAINING REQUIREMENTS: Principal Project Company shall ensure all workers on the Project Site, including DB Contractors' workers, complete the environmental trainings listed below. Principal Project Company shall ensure that such workers have all necessary training certifications, and personal protective equipment (PPE) as required by applicable Law. Principal Project Company shall submit to The SAR group within City Public Works Department certifications or proof of the trainings, listed below, as a Submittal as per Section 02 80 13 Hazardous Building Materials Remediation.
  - 1. Health and Safety training
  - 2. HAZWOPER training
  - 3. Cal/OSHA Competent Person training for the field supervisor overseeing activities that disturb asbestos, or naturally occurring asbestos (NOA) as per Title 8 CCR 1529.
  - 4. Cal/OSHA asbestos training (for all trades who will come in contact and disturb asbestos or NOA.
  - 5. Lead training (for all trades that will come in contact and disturb lead containing paints as per Cal/OSHA 1532.1 Lead in Construction standard)
  - 6. Medical examination and blood tests (as warranted)
  - 7. Respiratory protection (including current respirator fit test records)

8. Storm water pollution prevention awareness training to enable the Principal Project Company's personnel to comply with the Erosion and Sediment Control Plan.
9. Other training pertaining to the Work being conducted.

## **1.2 RELATED DOCUMENTS AND SECTIONS**

- A. Section 02 80 13 Hazardous Building Materials Remediation

## **1.3 SCOPE OF WORK – HAZARDOUS BUILDING MATERIALS**

- A. Principal Project Company is hereby notified that Hazardous Materials, including Hazardous Waste and contaminated materials, are present on the Project Site. Principal Project Company shall perform a survey of all Hazardous Materials on the Project Site.
- B. Principal Project Company shall verify existing conditions and quantities of Hazardous Materials and shall comply with all applicable Laws when handling these materials.
- C. Principal Project Company shall ensure that all abatement, removal, and remediation of Hazardous Materials is performed by a licensed abatement contractor under proper Cal-OSHA work procedures. The waste stream generated by abatement Work shall be classified, handled, containerized, labeled, manifested, transported, and disposed in compliance with applicable Laws.
- D. In performing the Work, Principal Project Company shall verify if the Work will involve the disturbance, removal, abatement, remediation, clean up, transportation and disposal of Hazardous Materials. Principal Project Company is responsible for the removal, abatement, remediation, clean up, transportation, and disposal of any such environmentally-regulated Hazardous Materials.
- E. Principal Project Company is responsible for verifying existing site conditions and quantities of Hazardous Materials. Principal Project Company shall comply with applicable Laws when handling these materials.
- F. Lead-Related Removal: lead-containing and lead-based paint are present throughout the Project Site in buildings and on interior and exterior finishes. Principal Project Company shall ensure that all painted surfaces affected by the Work are removed in accordance with Cal/OSHA 1532.1 Lead in Construction standard. The lead-related D&C Work shall be coordinated with all demolition work.
- G. The City has not verified that any paints, coatings, dusts, or other materials are not lead containing, therefore Principal Project Company shall ensure that all "trigger 1" construction activities, such as demolition of painted surfaces, manual scraping or sanding of painted surfaces, or renovations impacting painted surfaces and primed structural steel are completed using dust controls and personal protective measures in compliance with the Cal/OSHA Construction Lead Standard, 8 CCR 1532.1. All settled dust within ductwork, ceiling plenums, crawl spaces, attics, chases and non-regular housekeeping areas shall be treated as having measurable lead content requiring compliance with Cal OSHA 1532.1.
- H. Other Regulated Materials: Principal Project Company shall remove or recycle the following materials:
  1. PCB-containing Light Ballasts: Fluorescent fixtures and high intensity discharge lamps shall be treated as having a mix of PCB and non-PCB ballasts, requiring disposal of impacted suspect units as Hazardous Waste.
  2. PCB-containing building materials.

3. Mercury, Cadmium, and/or Sodium-Containing Fluorescent Light Tubes/Bulbs: Fluorescent and mercury vapor lamps on the Project Site shall be treated as having mercury content requiring removal and recycling of quantities greater than 25 fixtures per day impacted by the Project's demolition or renovation activities.
4. Mercury-containing Materials: All mercury-containing thermometers, thermostats, and all mercooid switches shall be treated as mercury-containing, requiring removal, disposal as Hazardous Waste .
5. Tritium Exit Signs/emergency lighting: Principal Project Company shall ensure that tritium exit signs/emergency lighting are properly recycled or disposed per Federal and State Law.
6. Sewage, Sludge, and Bacterial Hazards Associated from Untreated Sewage: Principal Project Company shall ensure that pigeon wastes and leaking sewage lines are treated as a biohazard and Principal Project Company shall comply with Cal/OSHA blood borne pathogen safety requirements.
7. Mold: Surfaces affected by mold growth shall be removed or treated as recommended in guidance documents, such as "Guidelines on Assessment and Remediation of Fungi in Indoor Environments" (New York City Department of Health, April 2000), guidelines established in Bio aerosols Assessment and Control (J. Macher, Editor, ACGIH, 1999) and "Mold Remediation in Schools and Commercial Buildings" (U.S. Environmental Protection Agency, March 2001) and as otherwise noted in the Contract Documents.
8. Lead Sheeting:
9. Arsenic: Principal Project Company shall assume the following conditions exist on the Project Site:
  - a. Treated timbers:
    - 1) Contain up to 3.9% of arsenic;
    - 2) Have a surface density measured at about 2,000 microgram/cm<sup>2</sup> of arsenic;
    - 3) Show 4 - 25 microgram/cm<sup>2</sup> loose arsenic based on wipe samples.
    - 4) Are considered Hazardous Waste.

#### **1.4 ABATEMENT CONTRACTOR'S QUALIFICATIONS**

- A. Principal Project Company may perform abatement Work itself, if it possesses the necessary qualifications and licenses, or it may subcontract the abatement Work. In either case, Principal Project Company shall ensure that any entity that performs the abatement Work:
  1. Submits to the SAR group within City Public Works Department current licenses and certifications for the specific type of abatement Work to be performed. Submits to the SAR group within City Public Works Department a letter confirming compliance with current Laws, as outlined in the specifications listed in the paragraph below.
  2. Submits to SAR group within City Public Works Department copies of any notices regarding safety and environmental violations received from regulatory agencies in the last 20 years.
  3. Meets the following minimum qualifications

- a. Is a legally recognized entity capable of entering into contracts and holding a valid license in good standing with the State of California and the City and County of San Francisco. Complies with all City contracting requirements and possesses the necessary qualifications to conduct business in San Francisco.
- b. Holds a valid **Class B**, General Building Contractor's license issued by the Contractors State License Board (CSLB) of the State of California.
- c. Holds a valid **Class C-22**, Asbestos Abatement Contractor license issued by the CSLB of the State of California, in accordance with Title 16, Division 8, Article 3 of the Business and Professions Code.
- d. Possesses a valid State of California Contractors State License Board (CLSB) Certification **ASB (Asbestos Certification)** in accordance with the provisions of Division 3, Chapter 9 of the Business and Professions Code.
- e. Is a current **Asbestos Registrant** with the California Department of Industrial Relations, Division of Occupational Safety and Health (DOSH), as required by Title 8 of the California Code of Regulations, Article 2.5.
- f. Possesses a valid **USEPA Lead Safe** Certificate to conduct lead-based paint renovation, repair and painting activities pursuant to 40 CFR Part 745.89 and fulfilling the requirements of the Toxic Substance Control Act (TSCA) Section 402.
- g. Possesses workers' documentation, medical records, and training required to perform the abatement Work.
- h. Has no less than five years of experience in abatement and/or removal of Hazardous Materials

B. Other Abatement Principal Project Company's Qualifications

- 1. Before commencing any abatement Work, Principal Project Company shall submit to the City's Authorized Representative and SAR group within City Public Works Department a Hazardous Materials Management Plan (HMMP) in accordance to the requirements of this Section, and Section 02 80 13 Building Related Hazardous Materials Remediation.
- 2. Principal Project Company shall submit to The SAR group within City Public Works Department current licenses and certifications for the specific type of abatement Work to be performed; copies of regulatory agencies notifications, abatement work plans, workers and competent person's documentation, waste disposal plan and documentation as required for the removal of the Hazardous Materials.

C. Project Safety Representative: In accordance with the requirements specific to this Section, listed below, and in Section 01 35 45- Health and Safety Criteria, Principal Project Company shall provide a qualified Project safety representative that reports to the Principal Project Company's superintendent. The Project safety representative shall be trained to identify, control, and manage the Hazardous Materials on the Project Site. The Project safety representative shall:

- 1. Enforce safe work and hygiene practices in compliance with Principal Project Company's Health and Safety Program and Hazardous Materials Management Plan (HMMP)
- 2. Advise Principal Project Companies, vendors, and visitors to the Project Site of potential hazards and minimum general requirements of the Principal Project Company's Health and Safety Program

3. Coordinate Principal Project Company's Work regarding Hazardous Material procedures and controls.
  4. Establish and maintain restricted work areas.
  5. Enforce proper use of personal protective equipment.
  6. Communicate approved modified safety requirements to Project Site personnel as well as visitors to the Project Site.
  7. Notify and coordinate with the City's Authorized Representative and The SAR group within City Public Works Department for the immediate assessment and remediation Work for unforeseen Hazardous Materials conditions discovered in the course of the Work.
  8. Notify and coordinate signing of waste manifests with the City's Authorized Representative and Site Assessment and Remediation (SAR) group within City Public Works in a timely manner
  9. Ensure Principal Project Company's personnel have proper training to perform the Work
- D. Hazardous Materials Handlers: Only qualified persons may perform Hazardous Material- related Work. Principal Project Company shall ensure that all personnel who come into contact with, are exposed to, disturb, operate equipment or otherwise handle Hazardous Materials have appropriate hazard communication and required training, personal and medical monitoring, and are certified to wear appropriate personal protective equipment as required by applicable Laws. Special qualifications may be required depending on the Principal Project Company's means and methods.
- E. For asbestos-related Work involving asbestos-containing material (ACM) equal to or greater than 100 square feet or 100 linear feet or affecting friable asbestos surfacing materials, thermal system insulation (TSI) and regulated asbestos-containing material (RACM), Principal Project Company or its Hazardous Materials abatement Principal Project Company shall:
1. Possess a valid asbestos handling license issued by the California State Contractors Licensing Board and a valid current certificate of registration for asbestos-related Work as issued by the California Department of Industrial Relations – Division of Occupational Safety and Health.
  2. Ensure that all Work is completed under the on-site supervision of a "competent person" as defined by Federal OSHA under Regulation 29 CFR Part 1926.1101 and Cal/OSHA under 8 CCR 1529.
  3. Ensure that all abatement workers have AHERA training with current annual eight-hour refresher training, annual medical exams for the use of respiratory protection, and a fit test of appropriate respirators every six months.
- F. Lead Hazard Control Work: Principal Project Company shall ensure that only qualified persons with California Department of Public Health (CDPH) approved lead workers training, annual medical examinations and approval for the use of respiratory protection, and semi-annual fit testing of respirators under the direct supervision of a CDPH approved lead supervisor engage in Work defined under Cal/OSHA regulation 8 CCR 1532.1 affecting lead-based paints and lead construction hazards, including but not limited to:
1. Working in an environment where lead exposures exceed 30 micrograms per cubic meter (mg/m<sup>3</sup>).

2. Controlling lead hazards, but not limited to, removal of loose and peeling lead-based paints, demolition and disposal of concrete-encased primed structural steel, removal of lead jacketed telephone cables and stripping of lead coatings from structural steel prior to torching or welding.
- G. As required by Title 17, California Code of Regulations (CCR), Division 1, Chapter 8 "Accreditation, Certification and Work Practices in Lead-Related Construction," Article 1, Sections 35001 et al, and Article 16, Sections 36000 and 36100. Lead Hazard Work, Principal Project Company shall ensure that: all affected workers have lead awareness training, current medical examinations and approval for the use of respiratory protection, and current fit testing of respirators complying with Cal/OSHA regulation 8 CCR 1532.1 when affecting lead paints and lead construction hazards including:
1. Demolishing or salvaging structural items where lead or materials containing lead are present.
  2. Removing or encapsulating materials containing lead.
  3. Constructing, altering, repairing or renovating structures, substrates, or portions thereof, that contain lead or materials containing lead.
  4. Installing of products containing lead.
  5. Cleaning-up of lead contamination.
  6. Transporting, disposing, storing, or containing lead or lead-containing materials on the site or other locations where construction and renovation activities are performed.
- H. Polychlorinated Biphenyls (PCB) Related Work: Principal Project Company shall ensure that removal of non-leaking PSB-containing ballasts and transformers is completed by workers with PCB hazard-awareness training as verified by the Principal Project Company's Project Safety Representative. Removal of leaking or damaged PCB-containing ballasts, transformers, and oils shall be completed only by trained workers, wearing protective gloves and following safety procedures as outlined in the HMMP. Hazardous Waste shall be handled according to the U.S. Environmental Protection Agency's Standards 40 CFR 761.60 and 761.65, and 22 CCR Section 66699(b).
- I. Mercury-Containing-Lamp-Related Work may be completed by workers with mercury hazard awareness training as verified by Principal Project Company's health and safety officer or superintendent.
- J. Other Hazardous Materials-Related Work may be completed by workers with specific hazard-awareness training of the Hazardous Material in question as verified by the Principal Project Company's Project Safety Officer.
- K. Contaminated Soils-Related Work including Underground Storage Tanks and CCA treated Wood: Principal Project Company shall ensure that workers have current 40-hour HAZWOPER training and 8-hour annual refresher training per regulation 29 CFR 1910.120, and 8 CCR 5192. Principal Project Company shall comply with the health and safety requirements, and the approved Site-Specific Hazardous Materials Management Plan (HMMP).
- L. Bio-hazard Work: Principal Project Company shall ensure that Work areas contaminated with fecal matter and human excretions, along with needles and syringes and other materials potentially contaminated with infectious blood borne pathogens or other biohazards comply with the health and safety requirements and the approved in a Site-Specific Hazardous Materials Management Plan.

- M. Mold and Fungi Remediation Work may be completed by workers with mold hazard awareness training as verified by the Principal Project Company's Project Safety representative.
- N. Principal Project Company shall ensure that:
  - 1. Hazardous Materials Haulers possess during the hauling of hazardous material, applicable federal, state, and local vehicle insurance requirements, valid driver's license, vehicle registration and licenses, and a current Class 1 Certification of Compliance from the California Highway Patrol affixed to each vehicle or container.
  - 2. Hazardous Materials Haulers possess a Hazardous Substance Removal Certification granted by the State of California Department of Toxic Substances Control (510-540-3802) and other required certifications and insurance.
  - 3. Drivers of Hazardous Materials hauling vehicles are informed about:
    - a. The nature of the material hauled.
    - b. Any recommended or required routes to and from the Project Site.
    - c. Applicable city street use regulations and requirements, and State of California Department of Transportation (Caltrans) codes, regulations and requirements.
    - d. The SAR group within City Public Works Department's requirements for proper handling and transportation of Hazardous Waste including mitigation controls and manifesting procedures.
    - e. The legal maximum loads for each vehicle.

## 1.5 REGULATORY REQUIREMENTS

- A. Principal Project Company shall comply with the procedures of this Section, and applicable Law regarding the generation, management, characterization, removal, abatement, remediation, transportation and disposal of Hazardous Materials. Principal Project Company is solely responsible for identifying which apply. Examples of regulations that may apply include:
  - 1. Resources Conservation and Recovery Act, 42 U.S.C. Section 6901 et seq.
  - 2. Regulations 40 CFR Part 260 et seq.
  - 3. California Health and Safety Code, Division 20.
  - 4. Regulations, and 22 CCR Section 66000 et seq.
- B. For asbestos (building materials) hazards, comply with the applicable requirements of the following federal, State and local regulations and requirements:
  - 1. For asbestos hazards: Principal Project Company shall comply with the applicable requirements of:
    - a. Cal/OSHA Construction Asbestos Standard, 8 CCR Section 1529.
    - b. BAAQMD Regulation 11, Rule 2 and Regulation 11 Rule 14.
    - c. Environmental Protection Agency NESHAP and AHERA regulations (40 CFR Part 763, as applicable).
    - d. Occupational Safety and Health Administration (inclusive of OSHA 29 CFR 1926.1101).

- e. California Environmental Protection Agency (Cal/EPA) Title 22.
  - f. Other applicable federal, State, and local governmental Laws pertaining to asbestos-containing materials (ACM) and asbestos waste.
  - g. The Final Regulation Order of the California Code of Regulations (CCR) Title 17, Public Health, Section 93105, on Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations.
  - h. All other applicable Laws, regulations, rules, ordinances, guidance documents and regulatory clarification letters and memos related to asbestos, Asbestos-Containing Materials (ACM), Asbestos Containing Building Materials (ACBM), Asbestos Containing Construction Materials (ACCM), and asbestos-containing waste.
2. For Naturally Occurring Asbestos (NOA) in on-site soil and fill, refer to Section 02 81 10 – Management of Excavated Materials, and Principal Project Company shall comply with the applicable requirements of:
- a. Cal/OSHA Construction Asbestos Standard, 8 CCR Section 1529.
  - b. Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations (CCR 17, Section 93105).
  - c. Bay Area Air Quality Management District (BAAQMD) rules, permits, notification forms, and regulatory information regarding Naturally Occurring Asbestos (NOA). (<http://www.baaqmd.gov/permits/asbestos/naturally-occurring-asbestos>)
  - d. Guidelines for Geologic Investigations of Naturally Occurring Asbestos in California, Special Publication 124, California Geologic Survey (<http://www.capcoa.org/Docs/noa/%5B24%5D%20CA%20Geol%20Survey%20Asbestos%20Guidelines.pdf>).
  - e. Determination of Asbestos Content of Serpentine Aggregate, Method 435”, California Air Resources Board (<https://www.arb.ca.gov/toxics/asbestos/tm435/workshops/m435-asbestosguidance-appacd2017.pdf>).
  - f. Implementation Guidance Document, Air Resource Board Test Method 435, Determination of asbestos Content of Serpentine Aggregate- Field and Laboratory Practices: CARB Monitoring and Laboratory Division, Quality Management Branch, Quality Management Section (<https://www.arb.ca.gov/toxics/asbestos/tm435/guidancedocument.pdf>).
  - g. Asbestos and Other Fibers by Phase Contrast Microscopy (PCM), NIOSH Method 7400 (<https://www.cdc.gov/niosh/docs/2003-154/pdfs/7400.pdf>).
  - h. Asbestos by Transmission Electron Microscopy (TEM), NIOSH Method 7402 (<https://www.cdc.gov/niosh/docs/2003-154/pdfs/7402.pdf>).
  - i. All other applicable Laws, regulations, rules, ordinances, guidance documents and regulatory clarification letters and memos related to Naturally Occurring Asbestos, asbestos, and Asbestos-Containing Materials (ACM), and asbestos-containing waste.
- C. For lead hazards, Principal Project Company shall comply with the applicable requirements of the following federal, State and local Laws:

1. Cal/OSHA Lead in Construction Standard, 8 CCR Section 1532.1 ([https://www.dir.ca.gov/title8/1532\\_1.html](https://www.dir.ca.gov/title8/1532_1.html)), and Cal/OSHA Lead in Construction Standard (Fact Sheet) ([https://www.dir.ca.gov/dosh/dosh\\_publications/lead-fct-sheet-rev.pdf](https://www.dir.ca.gov/dosh/dosh_publications/lead-fct-sheet-rev.pdf)).
  2. Cal/EPA Regulation 22 CCR Section 66000 (<https://www.dtsc.ca.gov/LawsRegsPolicies/Title22/>).
  3. Federal Lead Standard for the Construction Industry, 29 Code of Federal Regulations (CFR) part 1926.62
  4. California Department of Health Services (17 CCR Sections 35001 -35099).
  5. Title 17, California Code of Regulations, Division 1, Chapter 8 Accreditation, Certification and Work Practices in Lead Related Construction.
  6. Lead as a water pollutant:
    - a. Federal Clean Water Act (CWA), 40 CFR part 427.
    - b. California's Porter Cologne Water Quality Control Act.
  7. Federal Safe Drinking Water Act (SDWA), 40 CFR parts 141-143.
  8. Lead as a hazard to children: California's Childhood Poisoning Prevention Act, 17 CCR section 33001 et seq.
  9. Lead as a waste:
    - a. Federal Resource Conservation and Recovery Act (RCRA) of 1976,
    - b. 40 CFR part 240 et seq.
    - c. California's Hazardous Waste Control Law (HWCL), 22 CCR section 66260.1 et seq.
  10. San Francisco Building Code (SFBC), Chapter 34, as required where there is disturbance to painted surfaces on the exterior of buildings or structures within the City and County of San Francisco.
  11. Society for Protective Coatings Paintings Principal Project Companys' Certification Program (SSPC/PCCP) for the QP1 and QP2 Certifications.
- D. Respiratory Protection: Principal Project Company shall assess potential exposures to Hazardous Materials and conditions and comply with Cal/OSHA Regulations included in 8 CCR Sections 1529, 1532.1, and 5144, ANSI Standard Z88.2 - "Practices for Respiratory Protection", and 29 CFR 1926.62 (f). Principal Project Company shall ensure that workers wear appropriate respiratory protection during lead, asbestos and any other hazardous Work, unless negative exposure assessment testing verifies that worker exposures are below the PEL or Action levels.
- E. For PCB work: Principal Project Company shall comply with Cal/EPA Regulation 22 CCR Sections 66268.110 and 66508, and 40 CFR 761.
1. <https://www.epa.gov/pcbs/polychlorinated-biphenyls-pcbs-building-materials#Information-Contractors>
- F. For universal waste, Principal Project Company shall comply with Cal/EPA Regulation 22 CCR Sections 66261.50 and 66273.8 (CCR Title 22, Division 4.5, Chapter 34). Examples of universal waste: batteries, fluorescent tubes (lamps), electronic devices (cell phones,

computers, televisions), cathode ray tubes (CRTs), mercury wastes (thermometers and toys), and non-empty aerosol cans.

- G. For wood treated with chemical preservatives, such as chromate copper arsenate (CCA) treated wood: Principal Project Company shall comply with the federal insecticide, fungicide, rodenticide Act (FIFRA) and by the California Department of Pesticide Regulation (DPR) and Department of Toxic Substances Controls (DTSC) Regulations or for the treated wood waste as per the Health and Safety Code (HSC) 25150.7 and 25150.

## 1.6 DEFINITIONS

- A. Lead Abatement: as defined by the Department of Public Health for lead hazard work, includes any set of measures designed to reduce or eliminate lead hazards or lead-based paint, but excludes containment or cleanup. Abatement for lead is designed to permanently reduce or eliminate lead hazards for public (non-industrial) buildings or to last more than 20 years.
- B. Asbestos-Containing Material (ACM) for the purpose of Cal/OSHA compliance: Any material that contains more than 1% asbestos by weight for the purposes of abatement, waste disposal and fiber controls specified under this Agreement.
- C. Asbestos-Containing Material (ACM) for the purposes of CARB compliance under the ATCM: Any material that has an asbestos content of 0.25% or greater.
- D. Asbestos Containing Construction Materials (ACCM): Defined by Cal OSHA 8CCR§341.6 as any manufactured construction material which contains more than 0.10 % asbestos by weight.
- E. Asbestos Regulated Area: An area established where asbestos disturbance work is conducted and any adjoining area where disturbed material, debris and waste from such asbestos work occurs or is accumulated; and a work area within which airborne concentrations of asbestos exceed, or there is reasonable possibility that may exceed the permissible exposure limit (PEL).
- F. Asbestos-Related Construction Work: Defined by Cal OSHA 8CCR§1529 as construction work that includes the following:
  - 1. Demolition or salvage of structures where asbestos is present;
  - 2. Removal or encapsulation of materials containing asbestos;
  - 3. Construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain asbestos;
  - 4. Installation of products containing asbestos;
  - 5. Asbestos spill/emergency cleanup;
  - 6. Transportation, disposal, storage, containment of and housekeeping activities involving asbestos or products containing asbestos, on the site or location where construction activities are performed;
  - 7. Excavation and any disturbance of rock, soil, alluvium, or fill that may involve exposure to asbestos as a natural constituent that is not related to asbestos mining and milling activities;
  - 8. Erection of new electric transmission and distribution lines and equipment, and alteration, conversion and improvement of the existing transmission and distribution lines and equipment; and
  - 9. Routine facility maintenance.

- G. BAAQMD: Bay Area Air Quality Management District (Air District) is a regional agency with jurisdiction over the demolition and renovation of buildings and structures that may contain asbestos, and the manufacture of materials known to contain asbestos. BAAQMD regulations must always be followed when removing asbestos or demolishing buildings. The Air District has been delegated the authority to enforce federal asbestos regulation. The Air District developed its own asbestos rule in 1976 that is more stringent than the federal rule.
- H. Cumulative Renovations: A series of small (less than 30.8 m [100 feet] linear, 9.4 m<sup>2</sup> [100 ft<sup>2</sup>] or 1 m<sup>3</sup> [35 ft<sup>3</sup>]) renovations or removals of RACM performed during a calendar year at a single plant or facility which, taken together, would add up to a reportable amount under the provisions of BAAQMD Regulation 11, Rule 2.
- I. Demolition: Defined by BAAQMD as wrecking, intentional burning, moving or dismantling of any load supporting structural member, or portion thereof, of a building, facility or ship. This includes, but is not limited to, any related cutting, disjointing, stripping or removal of structural elements.
- J. Deteriorated Lead-Based Paint Hazard: painted areas with any of the following characteristics:
1. More than two square feet of deteriorated lead paint on interior components with large surfaces such as walls, ceilings, floors, and doors.
  2. More than ten square feet of deteriorated lead paint on exterior components with large surfaces such as outside walls.
  3. Deteriorated lead paint on more than ten percent of the total surface area of interior or exterior components with small surface areas such as windowsills, baseboards, trim, etc.
- K. Lead Activities: Lead hazard evaluation, lead-related construction work, or any activity which disturbs lead-based paint, presumed lead-based paint, or creates a lead hazard
- L. Lead Action Level: 30 micrograms per cubic meter based on an eight-hour time-weighted average (8 hr. TWA).
- M. Lead-Based Paint (LBP): LBP is defined in Title 17, CCR Division1, Chapter 8, Section 35033 as any paint, varnish, shellac, or other surface coating that contains lead equal to or greater than 1.0 mg/cm<sup>2</sup> as measured by X-ray Fluorescence (XRF) or laboratory analysis, or 0.5 percent by weight (5,000 µg/g, 5,000 ppm, or 5,000 mg/kg) as measured by laboratory analysis.
- N. Lead-Based Paint Activities: EPA's Title IV of the Toxic Substances Control Act defines Lead-Based Paint Activities as the following, among others:
- O. In any public building constructed before 1978, commercial building, bridge, or other structure or superstructure:
1. Identification of lead-based paint and materials containing lead-based paint
  2. De-leading
  3. Demolition
- P. Lead-Based Paint Debris: Any component, fixture, or portion of a building coated wholly or partly with LBP. LBP debris can also be any solid material coated wholly or partly with LBP resulting from a demolition. Examples among many others include ceilings, crown molding, walls, chair rails, doors, door trim, floors, fireplaces, shelves, and radiators, jacketed telephone cables and other heating units.

- Q. Lead-Based Paint Hazard: A condition in which exposure to lead from lead-contaminated dust, lead-contaminated soil, or deteriorated lead-based paint would have an adverse effect on human health (as established by the EPA Administrator under Title IV of the Toxic Substances Control Act). Lead-Based paint hazards include for example, deteriorated lead-based paint, leaded dust levels above applicable standards, and bare leaded soil above applicable standards.
- R. In Title 17, California Code of Regulations (CCR), Division 1, Chapter 8, Section 35037, the California Department of Public Health (CDPH) adds to this definition by stating “disturbing lead-based paint or presumed lead-based paint without containment, or any other nuisance which may result in persistent and quantifiable lead exposure.”
- S. Lead-Based Paint Hazard Abatement: Any set of measures designed to permanently eliminate lead-based paint hazards according to standards established by the appropriate federal agencies. Abatement measures include the following activities:
1. Removal of lead-based paint and lead-contaminated dust,
  2. Permanent containment or encapsulation of lead-based paint,
  3. Replacement of lead-painted surfaces or fixtures, and
  4. Removal or covering of lead-contaminated soil.
  5. Removal also includes all associated preparation, cleanup, disposal, and post-abatement clearance testing activities, record keeping, and monitoring.
- T. Lead-Based Paint Hazard Control: Activities to control and eliminate lead-based paint hazards, including interim controls, abatement, and complete abatement.
- U. Lead-Contaminated Dust: Surface dust containing an area or mass concentration of lead in excess of the standard established by the EPA Administrator, pursuant to Title IV of the Toxic Substances Control Act. CDPH’s threshold limits are as follows: 10 µg/ft<sup>2</sup> on interior floors, 100 µg/ft<sup>2</sup> on interior horizontal window surfaces, and 100 µg/ft<sup>2</sup> on exterior floors and exterior horizontal window surfaces. The most stringent criteria set forth by CDPH and/or the EPA shall apply to the work on this project
- V. Lead-Containing Material: Any material, coating, substrate or product, which contains any measurable amount of lead, with the definition of lead being in accordance to OSHA’s definition.
- W. Lead Hazard: Title 17, California Code of Regulations (CCR), Division 1, Chapter 8, sections 35000 -36100, the California Department of Public Health (CDPH) defines: lead hazard as deteriorated lead-based paint, lead contaminated dust, lead contaminated soil, disturbing lead-based paint or presumed lead-based paint without containment, or any other nuisance which may result in persistent and quantifiable lead exposure.
- X. Lead Permissible Exposure Limit (PEL): 50 micrograms per cubic meter based on an eight-hour time-weighted average (8hr. TWA).
- Y. Lead Related Construction Work: Any construction, alteration, painting, demolition, salvage, renovation, repair, or maintenance of any residential or public building, including preparation and cleanup that, by using or disturbing lead-containing materials or soil, may result in significant exposure of adults and children to lead.
- Z. Presumed Asbestos Containing Material (PACM) is thermal system insulation and surfacing material found in buildings constructed no later than 1980. PACM can be sampled to confirm whether it is ACM or not.

- AA. Project Safety Representative (PSR): Qualified person directly responsible under Principal Project Company's Superintendent having the necessary training to be knowledgeable in the identification, control, and management of the hazardous materials/waste on site, and health and safety. See Section 1.4(C) above for further definition.

## 1.7 PROJECT REQUIREMENTS

- A. Principal Project Company shall ensure that all Project personnel, including Principal Project Company's personnel, receive awareness training and orientation suitable to prevent inadvertent or unauthorized disturbance of Hazardous Materials that are present at the Project Site.
- B. If Hazardous Material, including Naturally Occurring Asbestos (NOA), not identified on the survey report is discovered, Principal Project Company shall immediately notify the City's Authorized Representative and the SAR group within City Public Works Department both verbally and in writing.
- C. Lead Hazards: All Construction Work that disturbs or affects intact paint and materials containing any detectable level of lead shall be performed by Principal Project Company under the Cal/OSHA Lead in Construction Standard 8 CCR 1532.1, Federal/OSHA's Lead Standard for the Construction Industry, Title 29 Code of Federal Regulations 1926.62, as well as all applicable Federal, State, and Local regulations. OSHA Lead in Construction Standard (29 C.F.R. part 1926.62 and title 8 CCR section 1532.1) requires awareness training and compliance on the part of an employer when there is any possibility that an employee could be exposed to lead as a result of his or her activities.
- D. Principal Project Company is prohibited from starting Hazardous Material removal Work without approved Hazardous Materials Submittals as described in Section 02 80 13. Principal Project Company shall not conduct any sampling or analysis of suspected building materials without prior permission from the City as Regulator. Principal Project Company shall ensure that only qualified AHERA certified building inspectors for asbestos sampling and the California Department of Public Health (CDPH) certified Project monitors for lead assessment are allowed to conduct the sampling.
- E. Pursuant to 29 CFR 1926.1101, Principal Project Company shall be deemed to exercise general supervisory authority over the Work covered by the standard, even though the Principal Project Company is not qualified to serve as the asbestos "Competent Person," as defined by the standard. As supervisor of the entire Project, the Principal Project Company shall ascertain whether any Principal Project Company is in compliance with the standard and shall require such contractor to come into compliance with the standard when necessary. Principal Project Company shall provide competent supervision by a designated Project Safety Representative (PSR) who can identify potential hazards at the Project Site and oversee implementation of appropriate protective measures to comply with all Cal/OSHA requirements applicable for Hazardous Materials.
- F. Principal Project Company is responsible for the general supervisory authority over all Hazardous Materials activities, both incidental and primary, for the demolition, renovation and Construction Work under this Agreement.
- G. Principal Project Company shall coordinate the activities that may have the potential to directly or indirectly impact Hazardous Materials. Work that may typically impact Hazardous Materials includes, as applicable and is not limited to:
  - 1. Demolition.
  - 2. Disturbance to any paints or coatings.

3. Torch cutting.
  4. Welding.
  5. Excavation.
  6. Dewatering.
  7. Shoring and Underpinning Work.
- H. Principal Project Company shall not create any condition that may endanger the health and safety of City employee's and its representatives, facility staff, construction workers, site visitors, outside consultants, and the general public, including exposure to hazardous materials. If the City's Authorized Representative or City as Regulator observes such conditions, then the City' has the authority to suspend Work until Principal Project Company corrects the condition as provided.
- I. Principal Project Company and its personnel shall have all the applicable hazard determination, exposure assessment, medical surveillance, engineering and work practice controls, respiratory protection, protective clothing and equipment, employee information and training, certifications, and monitoring program necessary to perform the Work and as required by Law and the Codes.
- J. Clean up, remediation and disposal of any Hazardous Materials disturbed during this Work shall be the responsibility of Principal Project Company. The level of engineering control and medical monitoring required shall be based on the governing regulations of Cal/OSHA that are effective for the Project Term for the level and extent of hazards exposure at the site.
- K. Principal Project Company shall maintain all Work areas within and outside the Project boundaries free from environmental pollution, which would be in violation of any federal, State or local Laws. Principal Project Company shall conduct Construction Work in strict compliance with the Contract Documents, including this Section and other related Sections.
1. The Project Schedule shall include work shifts for asbestos, lead-based paint, PCB ballast, PCB Building Materials, and other abatement as indicated.
- L. As per Health and Safety requirements specified under Section 01 35 45, Principal Project Company is responsible for monitoring its employees and Contractors' and Sucontractors' employees for exposure to Hazardous Materials, either used in construction or otherwise uncovered or intrinsically present at the Project Site.
- M. Principal Project Company shall not remove Hazardous Materials unless properly trained and certified for the handling of the Hazardous Materials encountered. (For example: workers trained and certified for Class I Asbestos Work with accordance to Title 8 CCR Section 1529).

## **1.8 WASTE HANDLING AND CHARACTERIZATION**

- A. Principal Project Company shall submit to the City as Regulator a Waste Management Plan (WMP) as specified under Section 02 80 13 Building Related Hazardous Materials Remediation.
- B. Principal Project Company shall characterize and profile the waste to ensure proper handling, transportation and disposal. Principal Project Company shall handle, transport and dispose of the waste.
- C. Principal Project Company shall segregate all waste streams. Principal Project Company shall accurately identify waste in accordance with all applicable Law and Codes. Individual waste containers must be labeled in accordance with Cal/OSHA labeling requirements.

- D. Principal Project Company shall obtain and pay for all sampling and profiling analyses required for waste disposal. Principal Project Company shall ensure that California CDPH-accredited laboratories perform analyses. Principal Project Company shall submit results of such analyses to the City as Regulator prior to scheduling the waste off haul.
- E. Principal Project Company shall ensure that all waste remains stored on the Project Site in a secured and designated waste storage area until results of waste characterization tests are available. Due to the time required to perform some analytical tests, this may require storage for up to 10 Working Days or more.
- F. Principal Project Company shall ensure that all contaminated and non-friable waste is hauled off the Project Site using a bill of lading approved by the City as Regulator, to an approved treatment/disposal facility, in accordance with all applicable Federal, State and local regulations.
- G. Principal Project Company shall provide and prepare a bill of lading and the non-hazardous waste manifest form for each shipment of material from the site. The bill of lading shall describe the contents of each truck carrying materials to the waste disposal site, including the name, address and phone number of the ultimate disposal site, the weight or yardage of the waste materials (as applicable), original location of the material, and an emergency phone number. Principal Project Company shall ensure that the hauler signs and dates the bill of lading indicating that he/she has accepted the load described in the manifest on that day. The City will sign the bill of lading before off haul and will retain the generator's copy. Principal Project Company shall provide copies of bills of lading accepted by the treatment/disposal sites to the City's Authorized Representative and City as Regulator. Principal Project Company shall follow manifesting procedures for the transportation and disposal of Class II material or lesser as specified this Section.
- H. Principal Project Company shall provide and prepare a Hazardous Waste manifest for each shipment of Hazardous Material determined from the Project Site. The manifest shall describe the contents of each truck carrying materials to the waste disposal site, including the name, address, and phone number of the ultimate disposal site, the weight or yardage of the waste materials (as applicable), original location of the material, and an emergency phone number. Principal Project Company shall ensure that the hauler signs and dates the manifest indicating that it has accepted the load described in the manifest on that day. The Site Assessment and Remediation (SAR) group within City Public Works Department will sign the manifest before off haul and retain the generator's copy. Principal Project Company shall provide copies of manifests accepted by the treatment/disposal sites to the City. Principal Project Company shall follow Hazardous Waste manifesting procedures for the transportation and disposal of Hazardous Material.
- I. Principal Project Company shall package, label, transport, and dispose of Hazardous Waste in accordance with applicable Cal/EPA regulations under Title 22 CCR and the California Health and Safety Code, including completion of the Uniform Hazardous Waste Manifest (UHWM). Information on the UHWM must include the quantity of waste in cubic yards and the name and address of the BAAQMD to comply with EPA Waste Shipment Record requirements. Principal Project Company shall follow the waste disposal; and manifesting requirements as specified this Section.
- J. Principal Project Company shall provide and prepare the bill of lading, the non-hazardous waste manifest form, and the Hazardous Waste manifests forms by typing in a neat, correct, and legible fashion for signing by the generator. Principal Project Company shall notify the City's Authorized Representative and the SAR team within City Public Works Department at least 48 hours in advance of the time at which the manifest is ready to be signed.
- K. Principal Project Company shall ensure that all lead-containing waste or debris, including, but not limited to, painted building components, ceramic tile glazes, jacketed telephone cables, respirator cartridges, disposable suits, and other associated debris generated during this work,

is packaged for disposal as Hazardous Waste until waste characterization has been completed and analytical results are available. Waste shall be segregated into distinct waste streams according to the waste categories suggested in the Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing, (a.k.a. "the HUD Guidelines"), dated June 1995 (Revised July 2012), which include the following:

1. Category I: Low Lead Waste – typically non-hazardous construction materials, filtered wash water, cleaned plastic sheeting, and other items that test as non-hazardous;
  2. Category II: Architectural components, such as painted finished items like siding, doors, windows, trim, etc. which demonstrate intact or stabilized surface coatings;
  3. Category III: Concentrated Lead Waste - typically hazardous materials such as paint sludge, paint chips vacuum debris, vacuum filters, and any waste testing hazardous; and
  4. Category IV: Other lead-containing waste requiring characterization testing.
- L. Disposal of intact lead-coated architectural or structural elements may occur as non-hazardous waste in accordance with Cal/EPA's and the Department of Toxic Substance Control's requirements.
- M. Principal Project Company shall ensure that waste characterization for lead hazard content is performed in accordance with 22 CCR §66262, ET. seq., including using one or more of the following testing procedures, as required, and is manifested and properly disposed:
1. Total Threshold Limit Concentration (TTLC)
  2. Waste Extraction Test (WET)
  3. Toxicity Characteristic Leaching Procedure (TCLP)
  4. SW 846
- N. Miscellaneous Hazardous Waste Disposal. Principal Project Company shall comply with the following:
1. Disposing of PCB-containing ballasts in landfills is prohibited by Federal and State Law. Drums containing PCB ballasts and other PCB-contaminated materials must be disposed of, or otherwise treated, at an EPA-approved facility.
  2. Ballasts with "Non-PCB" fluids, must be disposed of at a legally permitted disposal/recycling facility as assumed DEHP-containing ballasts.
  3. Fluorescent lamps must be stored in packaging or containers that are designed to minimize breakage/damage during both storage and shipping. Containers shall be labeled as "Universal Waste – Spent Fluorescent Lamps" or "Universal Waste," as appropriate, and each container shall be marked with the date on which storage of said waste began.
  4. Principal Project Company shall use a bill of lading or non-hazardous waste form that contains the following information when shipping fluorescent lamps to a recycler: name and address of generator, transporter, and recycler; number of lamps shipped; date of shipment and date of receipt by recycler; and obtain a dated signature of the receiving recycler. A copy of the bill of lading shall be submitted to the City's Authorized Representative and SAR group within City Public Works Department at abatement completion.

O. Universal Waste Disposal

1. Principal Project Company shall comply with the following universal wastes specific disposal procedures under 22 CCR 66273.10 through 66273.21:
  - a. Batteries, as described in section 66273.2, subsection (a);
  - b. Electronic devices, as described in section 66273.3, subsection (a);
  - c. Mercury-containing equipment, as described in section 66273.4, subsection (a);
  - d. Lamps, as described in section 66273.5, subsection (a) (including, but not limited to, M003 wastes);
  - e. Cathode ray tubes, as described in section 66273.6, subsection (a);
  - f. Cathode ray tube glass, as described in section 66273.7, subsection (a); and
  - g. Aerosol cans, as specified in Health and Safety Code section 25201.16.
2. Principal Project Company shall ensure that universal wastes are segregated and shipped for disposal following DOT shipping requirements in 49 CFR 171 through 180.
3. Universal Wastes can be shipped using a bill of lading to a Universal Waste Handler licensed under the requirements of 22 CCR 66273.

P. Asbestos Waste Disposal

1. A waste that is friable and contains asbestos over 1 percent is regulated as a California (Non-RCRA) hazardous waste under 22 CCR 66261.24. Principal Project Company shall characterize and profile asbestos-containing waste to determine its correct waste disposal classification.
2. Principal Project Company shall comply with the following requirements that apply to transportation and disposal of asbestos Hazardous Waste:
  - a. Packaging in sealed, leak-tight, non-returnable containers from which the fibers cannot escape following 40 CFR 61.150 or, in order to prevent breakage of larger items, in bulk containers lined with plastic sheeting and covered it with a tarp following 22 CCR 66263.23.
  - b. Labeling of the asbestos Hazardous Wastes shall follow 29 CFR 1910.1001, 29 CFR 1926.1101, and 8 CCR 5208.
  - c. Asbestos Hazardous Wastes shall be shipped using a registered hazardous waste hauler to landfills permitted to accept asbestos wastes.
  - d. d) Principal Project Company shall provide, prepare and submit to the City's Authorized Representative and SAR group within City Public Works Department a Uniform Hazardous Waste Manifest Form for asbestos Hazardous Waste shipments.

**1.9 USE OF NON-HAZARDOUS WASTE MANIFEST FOR CLASS II MATERIAL OR LESSER** For the profiling of each waste stream, Principal Project Company shall fill out the waste acceptance profile form, set up an account, and obtain the waste profile number from the landfill provider.

- B. For transportation and disposal of the waste, Principal Project Company shall provide and prepare for the City's Authorized Representative and City as Regulator a non-hazardous waste

manifest form obtained from the landfill provider. The non-hazardous waste manifest form shall be completed for each vehicle carrying excavated material classified as California Class II non-RCRA waste, or of a lesser waste classification. Principal Project Company shall submit each non-hazardous waste manifest form to the SAR group within City Public Works Department for the generator's signature at least 72 hours in advance of the day of the off-haul with an estimate of the number of loads scheduled for off-haul. The non-hazardous waste manifest form shall contain the following information before providing the final copy for the City as Regulator to sign:

1. Name, address and phone number of the generator, Project name, and Specification Section number.
  2. Principal Project Company's billing information
  3. Name, address and phone number of the transport company.
  4. The Name, address, and telephone number of the receiving facility i.e., disposal facility.
- C. The City will not be responsible for off haul delays if Principal Project Company does not notify the City in a timely manner to sign the non-hazardous waste manifest forms.
- D. Within 30 days of the off haul, Principal Project Company shall submit to the City's Authorized Representative and SAR group within City Public Works Department with copies of each completed non-hazardous waste manifest Form (with the landfills signature).
- E. Principal Project Company shall furnish all labor, materials, equipment, and incidentals required to transport those materials identified as non-hazardous waste for the purpose of disposal.
- F. Principal Project Company shall prepare waste characterization and profiling information documenting the non-hazardous nature of the category of waste.
- G. By the end of the workday, Principal Project Company shall prepare bills of lading for each vehicle for all excavated material loads classified as non-hazardous waste (California Class II or lesser), for the purpose of off-site transportation and disposal purposes. The bill of lading shall be designed to contain the following information:
1. Name, address and phone number of the transport company
  2. Name of the driver, a dated signature from the driver, vehicle license number, trip number.
  3. Weight as recorded at the landfill of waste excavated material.
  4. Date of transport.
  5. Name, address and phone number of the receiving facility i.e., disposal facility. A dated signature from the receiving facility.
  6. Name, address and phone number of the generator, along with the Contract No. and Project name.
- H. A copy of each bill of lading and a certified weight ticket is an indication of the weight of the shipment, which has been received at the disposal facility. Principal Project Company shall maintain files of all bills of lading and furnish such information to the City if requested.
- I. Principal Project Company shall ensure that the transporter signs and dates the bill of lading indicating that the transporter accepted the load described in the bill of lading on that day for that particular trip.

## 1.10 HAZARDOUS WASTE MANIFESTING PROCEDURES FOR CLASS I MATERIAL

- A. Principal Project Company shall furnish all labor, materials, equipment, and incidentals required to transport those materials identified as Hazardous Waste for the purpose of disposal.
- B. Principal Project Company shall comply with all applicable regulatory requirements listed as well as other applicable federal, State, and local laws, codes, and ordinances, which govern or regulate transportation of wastes (including DOT-HM 181 in accordance with 49 CFR 172).
- C. Principal Project Company shall ensure that all packing, labeling, transporting, and disposing of Hazardous Waste complies with regulations under 22 CCR, including providing and completing the Uniform Hazardous Waste Manifest Form.
- D. Principal Project Company shall follow applicable regulations under 40 CFR Part 263, and 22 CCR Section 66263, "Standards Applicable to Transporters of Hazardous Waste," including licensing, manifest system, record keeping, and discharges.
- E. Principal Project Company shall ensure that all material classified as Hazardous Waste (Federal Class 1 RCRA and California Class 1 non-RCRA wastes only) is hauled off using a licensed Hazardous Waste transporter and the uniform Hazardous Waste manifest form (DTSC Form 8022A and/or EPA Form 8700-22 a.k.a. the manifest).
- F. Preparation and handling of waste manifests
  - 1. Principal Project Company shall provide and prepare the waste manifests and landfill profiles for each shipment of Hazardous Wastes from the site. Principal Project Company is hereby notified that Hazardous Waste manifest, waste profiling, and landfill service agreements have to be prepared and have to be approved by the landfill in advance of the off-haul. Principal Project Company shall consult with the SAR group within City Public Works Department for local requirements in filling out the forms.
    - a. The manifest prepared by the Principal Project Company shall describe the contents of each truck carrying materials to the waste disposal site, including the weight of the waste materials.
    - b. The City as Regulator will provide a hazardous waste generator identification number for use on the manifest. Principal Project Company shall provide the State Transporter identification number and telephone number.
    - c. Principal Project Company shall ensure that the licensed transporter also signs and dates the manifest indicating that it has accepted the load described in the manifest on that particular day.
    - d. Only a DOT Certified City employee (and not Principal Project Company) will sign the manifest for the "generator" of the waste.
  - 2. Principal Project Company shall notify the SAR group within City Public Works Department and the City's Authorized Representative 72 hours prior to off-haul of all excavated material. Off-haul shall occur between the hours of 8:00 a.m. and 4:30 p.m. Monday through Friday (excluding City holidays).
  - 3. The SAR group within City Public Works Department will sign and keep the generator's copy of the manifest and give the remaining copies to the licensed transporter.
  - 4. The licensed transporter shall carry the hazardous waste manifest with each truckload using the traffic control approved routes for off haul.

5. Within 2 days of its return, Principal Project Company shall provide the SAR group within City Public Works Department with the completed waste manifest. The completed waste manifest shall be certified by the receiver of the waste shipment, confirming that the shipment was received at the waste treatment or disposal facility designated in Principal Project Company's bid, and certifying the weight of the shipment.
6. Should any waste manifest not be returned within 35 days of shipment, Principal Project Company shall initiate follow-up, shall document such follow-up effort in writing with an Exception Report in accordance with 40 CFR 262.42 and/or 22 CFR 66262.42, and shall provide a copy to the SAR group within City Public Works Department and the City's Authorized Representative.

G. Mandatory City Information for the Manifest

1. Principal Project Company shall use the following information for preparing a manifest form:
  - a. Manifest Item 1: Generator's US EPA ID Number for Project: CAD982008120
  - b. Manifest Item 3: Emergency response Phone: A 24 hour phone line shall be provided by Principal Project Company
  - c. Manifest Item 5:
    - 1) Generator's Name and Mailing Address:  
City and County of San Francisco  
Department of Public Health/BEHM  
1390 Market St., Suite 210  
San Francisco, CA. 94102  
  
*Generator's Site Address:*  
City and County of San Francisco  
To be provided by the City
  - d. Manifest Item 14: The following information is mandatory:
    - 1) Name of Project
    - 2) Project Manager
    - 3) Project Manager Phone Number #

**PART 2 - PRODUCTS (NOT USED)**

**PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## SECTION 01 35 45 - HEALTH AND SAFETY CRITERIA

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. Comply with legal and regulatory requirements applicable to the health and safety of persons during the performance of the Work and at the Project Site.
- B. **Work on the Project Site may commence only after the City accepts the Project's Health and Safety Plan (HASP).**
- C. Principal Project Company shall be solely responsible for:
  - 1. Complying with the terms of this Section.
  - 2. Developing, submitting, implementing, maintaining, and enforcing a site-specific Health and Safety Plan (HASP).
  - 3. Posting all OSHA-required notices and establishing a safety program for the Work.
  - 4. Complying with all applicable Cal/OSHA training, safety device, reporting, Work performance requirements.
  - 5. Determining and complying with all applicable health and safety requirements, in accordance with applicable Laws.
  - 6. Determination and implementation of construction means, methods, techniques, sequences, and procedures, including all safety precautions, training and programs taken in connection with the Work, as well as coordinating all portions of the Work.
  - 7. The health and safety of Principal Project Company's employees, Principal Project Companys, and visitors as set forth in applicable Laws.
  - 8. Implementing, maintaining, and enforcing all safety precautions and programs concerning the Work.
  - 9. Conducting air monitoring at the Project Site for Principal Project Company's personnel and Principal Project Companys' personnel, as required by applicable Laws. The City as Regulator may conduct ambient air monitoring as it deems necessary.
  - 10. Payment of all fines, penalties or damages that result from Principal Project Company's failure to comply with applicable health and safety Laws.
- D. The health and safety requirements set forth in this Section are not a comprehensive list of safety requirements that may apply to Work. And, some of the specified requirements may not apply to the Work, depending on the type and scope of the Work.
- E. The City as Regulator will neither assume the administration of nor direct, control or otherwise assume any responsibility for the implementation and enforcement of the Principal Project Company's health and safety program.
- F. Principal Project Company shall be solely responsible and shall assume all liability for compliance with the safety orders, regulations, and requirements of:
  - 1. Work Hours and Safety Standards Act (40 U.S.C. 327 et seq.)

2. Construction Safety Orders (8 CCR, subchapter 4 et seq.)
  3. Federal OSHA.
  4. Cal/OSHA.
  5. California Public Utilities Commission (CPUC).
  6. State of California Public Utilities Commission, General Order No. 172, Rules and Regulations Governing the Use of Personal Electronic Devices by Employees of Rail Transit Agencies and Fixed Guideway Systems.
  7. The State of California Wireless Communications Device Law (effective January 1, 2009) makes it an infraction to write, send, or read text-based communication on an electronic wireless communications device, such as a cell phone, while driving a motor vehicle.
  8. California Vehicle Code.
  9. Local regulations pertaining to Work practices, protection of workers and visitors to the site.
- G. Nothing contained in this Agreement shall relieve Principal Project Company, or any Principal Project Company or Supplier, from the obligations set forth above and obligations as required by applicable Laws. If a provision of this Section conflicts with any applicable provision of this Agreement or any federal, state, or local safety regulations, the more stringent requirements that maintain a greater level of safety shall apply.
- H. Ensure all tiers of field personnel, employees, agents, visitors and Principal Project Companies:
1. Are provided the proper notifications, training, and procedures as required by the Project's Health & Safety Plan, including but not limited to the handling of unidentified Hazardous Materials.
  2. Follow safe practices and minimize exposure when dealing with unanticipated and unidentified Hazardous Materials.
  3. Minimize potential risks during Project construction by having all construction personnel follow the Project's Health & Safety Plan.
  4. Provide and maintain personnel safety training and medical examinations in accordance with all applicable Law.
- I. Conduct any required personal air monitoring of its workers, at its own expense Principal Project Company shall be responsible for providing its employees and visitors with all levels of personal protective equipment (PPE). Principal Project Company shall be responsible for providing its employees and visitors with all levels of training and PPE, including personal air monitoring if required. This includes areas where hazardous and contaminated soils and waste is encountered.
- J. Principal Project Company shall have considered the productivity losses, if any, arising from the use of respirators and PPE.

## 1.2 JOB CONDITIONS

- A. Performance of the Work involves working in environments that may be hazardous, contaminated, and non-hazardous. Serpentinite and other ultramafic rocks that contain naturally occurring asbestos may be present within earthen materials at the Project Site. Work that disturbs on-site rock and soil shall be performed under Cal/OSHA Class II procedures, as required by Cal/OSHA regulations (CCR Title 8 § 1529, asbestos in construction).
- B. Such hazardous, contaminated, and non-hazardous environments include, but are not limited to; Hazardous Materials, non-hazardous materials, soils, groundwater and storm water, heavy metals (including lead), asbestos, serpentinite and other ultramafic rock that contains naturally occurring asbestos, respirable crystalline silica, lead containing paint and building materials, petroleum hydrocarbons, polynuclear aromatic hydrocarbons, organic compounds, railroad ties, sewage, sludge, debris, grit, sewer gases, oxygen deficiency, bacterial/biological contamination, odors from petroleum hydrocarbons, and other volatile/semi-volatile organic compounds and confined spaces.
- C. Construct/finish, and at all times maintain satisfactory and substantial ramping, guard rails, warning flags, and signs at appropriate heights, temporary chain link fencing, solid fencing, railings, barricades, steel plates or bridging as applicable at all openings, obstructions, or other hazards in streets, sidewalks, pedestrian pathways affected by construction. All such barriers shall have adequate warning lights as necessary or required for public safety. Divert traffic by use of traffic cones, barriers, flagmen, flags, and signs adequate to conditions at the Project Site and task at hand. All temporary and permanent safety features shall be installed before beginning commencing Work at the Project Site.
- D. Lead Hazards: Perform all Work that affects intact paint with any level of lead , at minimum, in accordance with the Cal/OSHA Lead in Construction Standard 8 CCR 1532.1 and other applicable Laws.
- E. Work in this Agreement may include, but is not limited to, the following activities that may pose safety and health hazards to Principal Project Company:
  - 1. Working around live, high voltage lines and wires, switches, moving vehicles and other potential hazards specific to a City yard, facility, or operating rail line.
  - 2. Working around live utilities.
  - 3. Entering or working in confined spaces.
  - 4. Working around and inside shafts.
  - 5. Working within an underground excavation and construction environment using mechanized equipment and structural temporary shoring support equipment.
  - 6. Working within an underground tunnel environment using mechanized equipment.
  - 7. Working with soils that may be hazardous or contaminated, or both.
  - 8. Working around and in open trenches.
  - 9. Working in spaces or areas where employees may be exposed to asbestos and lead.
  - 10. Welding, painting, or other potentially hazardous Work, or working in the vicinity of such activities.
  - 11. Working in a public right-of-way with vehicular traffic moving around or through the Project Site.

12. Working in rail right of way with light rail vehicles moving around and through the Project Site.
- F. Protect the public from hazards including surface irregularities, un-ramped grade changes in pedestrian sidewalks or walkways, and trenches or excavation in roadways. Ensure safe routing of vehicular and pedestrian traffic around the Project Site, in compliance with American's with Disabilities Act (ADA) requirements.

### 1.3 SUBMITTALS

- A. Principal Project Company shall submit to the City the following Submittals no later than ten Days before start of Work at the Project Site or NTP2, whichever is earlier. No construction Work shall start prior to City acceptance of the submittals listed below. Each Submittal listed below shall be a separate document and shall not combined within one another.
1. Site-specific Health and Safety Plan (HASP) prepared, signed and stamped by a Certified Industrial Hygienist (CIH).
  2. Principal Project Company's Injury and Illness Prevention Programs (IIPP) and Code of Safe Practices (CSP), in accordance with the California Code of Regulations (CCR), Title 8.
  3. Templates for all safety forms and reports:
    - a. The Project Safety Representative's (PSR) daily inspection form shall accommodate twice daily inspections of their field work area(s) covering date, work area checked, employees present in the work area, PPE, work equipment being used in each area, workplace conditions, physical facility safety, and employee work practices. The form shall also accommodate any deficiencies and corrective actions.
    - b. The Safety Meeting Attendance sheet of the "toolbox" safety meetings conducted per CAL/OSHA standards.
    - c. Activity Hazard Analysis (AHA) or Job Hazard Analysis (JHA).
    - d. Incident or Near-Miss Incident Investigation Reports.
    - e. Corrective Actions Report.
    - f. Project Site Visitor Policy Form
  4. Completed Activity Hazard Analysis (AHA) or Job Hazard Analysis (JHA) submitted with the HASP using the AHA/JHA template for all significant activities and tasks with a high-risk potential, describing the job steps, hazards associated with each job step, and the controls used to remove or minimize the associated hazards
  5. SDS (Safety Data Sheet) for all chemicals and other hazardous materials used in the Work.
  6. If Serpentine is present Principal Project Company shall have Cal/OSHA 40-hour asbestos training for the competent person overseeing Serpentine/ Naturally Occurring Asbestos (NOA) disturbance activities and managing personal air monitoring for asbestos.
- B. Experience Statement. Principal Project Company shall submit to the City no later than 10 days prior to the start of construction Work the qualifications and experience of the it's Project Safety Representative (PSR) as specified in this Section 01 35 45 – Health and Safety Criteria.

1. Documentation and Certification (current and valid) of the Project Safety Representative (PSR):
    - a. The name of the designated Project Safety Representative (PSR).
    - b. OSHA Certified 30-Hour Construction Training.
    - c. The 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) Training Program.
    - d. First Aid/CPR certification/training within the past two years
    - e. Cal/OSHA 40-hour asbestos training for the Competent Person overseeing NOA disturbance activities and managing personal air monitoring for asbestos.
    - f. Documentation demonstrating a minimum of three (3) years recent experience in conducting and supervising safety and health programs on construction projects similar to the Work of this Contract.
- C. Principal Project Company shall maintain the following throughout the course of construction and provide to the City immediately upon request.
1. Daily inspection reports (as per Part 1.7 of this Section) signed by the PSR documenting twice daily inspections of their field work area(s) covering date, time visited, work area checked, employees present in the work area, PPE, work equipment being used in each area, workplace conditions, physical facility safety, and employee work practices. Any deficiencies and corrective actions shall also be documented.
  2. Records of topics and safety meeting attendance sheet of the “toolbox” safety meetings conducted per CAL/OSHA standards.
  3. Incident or Near-Miss Incident Investigation Reports and Corrective Action Reports – Submitted to the City’s Authorized Representative within 24 hours of the Project Incident or Near-Miss Incident.
  4. Final Incident or Near-Miss Incident Investigation Reports and Final Corrective Action Reports – Submitted to the City’s Authorized Representative within 48 hours of the Project Incident or Near-Miss Incident.
  5. HASP modification requests, and approved modifications to the appended HASP – Submitted to the City for review (if applicable).
  6. Respiratory Protection Program, records and documentation (if applicable to the Work).
  7. Hot Work permit (if applicable to the Work).
  8. IIPP and CSP modification requests and approved modifications to the appended IIPP and CSP.
  9. OSHA’s Form 300A “Summary of Work-Related Injuries and Illnesses” annual form. (Principal Project Company shall submit the Form 300A each year and whenever it is updated).
- D. Upon receiving a written request from the City, Principal Project Company shall submit to the City any document relating to health and safety within five (5) Days from the date of such request.

## 1.4 REFERENCES

Work performed shall be consistent with the following guidelines and references and in compliance with all applicable regulations and standards, including those listed below. In the case that these requirements are conflicting, the one which offers the greatest level of safety shall be followed.

## 1.5 HEALTH AND SAFETY PLAN (HASP)

- A. Principal Project Company shall submit a Site-specific Health and Safety Plan (HASP) in accordance with this Specification, CFR Title 29, CCR Title 8 and other applicable regulations, which shall cover all aspects and scope of Work. The HASP shall remain in effect for the term of this Agreement and a copy of the HASP must always be on-Site.
- B. Principal Project Company's Site-specific HASP shall set forth the policies and procedures to be followed by all Principal Project Company personnel at the Site. The HASP shall describe the safety requirements for the Work, and the means and methods by which Principal Project Company will implement and enforce those safety requirements. The HASP shall describe, in detail, the protocols necessary for the identification, evaluation, mitigation and control of all hazards associated with the Work and each task performed by Principal Project Company and all Principal Project Companies. The HASP shall identify Principal Project Company's Project Safety Representative (PSR) responsible for Project Site safety and enforcing safe practices in performing the Work. Principal Project Company's site-specific HASP shall describe the responsibility for employee and public safety of Principal Project Company's representatives who control each phase of the operations and shall set forth in writing the policies and procedures to be followed by all Principal Project Company personnel. Principal Project Company HASP shall establish, in detail, the protocols necessary for the recognition, evaluation, and control of all hazards associated with each task performed by Principal Project Company and lower tier Principal Project Companies.
- C. The HASP shall be prepared, signed, and stamped by a Certified Industrial Hygienist (CIH). The HASP shall also be reviewed and signed by the Project Safety Representative (PSR), whose review shall be limited to general scope and completeness. Principal Project Company shall always be solely and entirely responsible for the safety of the Project Site and its personnel, Principal Project Company's personnel, persons working at or visiting the Project Site (including City representatives, employees and consultants), and persons passing through the Construction Area. Principal Project Company shall be solely responsible for the content, implementation and enforcement of its HASP. Principal Project Company shall not perform any Work at the Project Site until the HASP has been submitted to and accepted by the City.
- D. The City will not review the HASP for its content, nor will the City be liable for Principal Project Company's failure to have an adequate HASP or implement it. Submission to and receipt of the HASP to the City and regulatory agencies neither constitutes to the legality of the HASP nor does it incur liability. Submission, acceptance, and receipt of the HASP to the City, or any review of the HASP by the City, shall not be construed as approval of the adequacy of Principal Project Company's PSR, Principal Project Company's HASP or any safety measures taken in or near the construction site.
- E. Any changes or modifications to Principal Project Company's HASP must be signed by Principal Project Company's PSR and submitted to the City. The modification shall be appended to Principal Project Company HASP. All personnel working on the Project Site shall be fully informed of the modifications of the HASP and any required actions arising from those HASP modifications before performing any of the Work that may be impacted by those modifications.
- F. The HASP shall be divided into two parts. Part One shall address the Environmental Health aspect of safety. Part Two shall address Construction Safety.
- G. Part One of HASP - Environmental Health:
  - 1. Identification and description of the responsibility of those individuals who control each phase of operations and are responsible for employee and public safety. The HASP shall set forth in writing the policies and procedures to be followed by all personnel. The HASP shall include the designation and resume of an overall Project Safety Representative (also referenced as health/safety officer). The PSR shall have full authority to correct any

unsafe conditions at the Project Site or unsafe means or methods of performing the Work. The PSR shall have the authority to stop any construction activity or modify Work practices, means or methods that do not accord with the HASP or that are necessary to protect workers, property, and the surrounding community. This requirement shall apply throughout the term of this Agreement and is not limited to working hours.

2. Hazard Communication Plan: Information identifying and delineating all workplace hazards that has been identified or is generally associated with the proposed Work phases and how this information is communicated to employees (e.g., tailgate/toolbox safety meetings, monthly safety meetings, and daily job briefings). Hazardous material communication standards can be found in 29 CFR 1910.120 & 8 CCR 5194. Hazardous waste information can be found in 29 CFR 1910.1200 & 8 CCR 5192. Local hazardous material/waste information can be found in Articles 21, 21A, 22 and 22A of the San Francisco Health Code.
3. Mitigation measures to identify, monitor, and control worker and general public exposure to any identified hazard. Principal Project Company shall determine the need to conduct and monitor its personnel for contaminant exposure to maintain the proper level of personal protection, including the action level.
4. Personnel: Provision of enough personnel properly trained to handle, remove, excavate and dispose of hazardous waste and contaminated waste that may be encountered or generated by the Work. The HASP shall specify the general training required for all Principal Project Company personnel, and any specialized training required for personnel identified to manage and/or handle hazardous materials, including but not limited to:
  - a. Asbestos training that meets the Cal/OSHA Work Activity Level for naturally occurring asbestos (NOA) as per the Cal/OSHA Construction Asbestos Standard, 8 CCR 1529, all applicable Sections and Section 1529.
  - b. Lead, petroleum hydrocarbons, volatile and semi-volatile organic compounds (VOC's and SVOC's) awareness training.
  - c. The 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) Training Program.
  - d. It's associated 8-hour refresher training in accordance with 29 CFR 1910.120, and 8 CCR 5192.
  - e. Respiratory program in accordance with 29 CFR 1910.134 and 8 CCR 5144.
  - f. Respirable Crystalline Silica OSHA Regulation in accordance with 29 CFR 1926.1153
  - g. Other Site-specific or Project specific hazards requiring safety training.
5. This training shall be required for all Principal Project Company and Principal Project Company personnel who will encounter or operate equipment that handles contaminated materials. The HASP shall include records establishing the subject matter, dates, times, and attendees of all safety trainings. Principal Project Company shall maintain training records as required by Cal-OSHA and applicable regulations.
6. NOTE: Cal/OSHA regulations are triggered when asbestos is present in any amount. Principal Project Company shall meet its obligations under CCR Title 8, Section 1529. The regulation requires monitoring to determine exposure levels, wet methods, respirators and protective clothing, controlled access to the work area, and similar precautions associated with asbestos work regardless of the origin of the asbestos. Use

of a competent person to oversee the work may also be necessary. Principal Project Company shall utilize an experienced Certified Industrial Hygienist (CIH) and a Professional Geologist (PG) to assist it with this work.

7. Requirements of Principal Project Company and Principal Project Companies for implementing the following:
  - a. Medical surveillance programs. Principal Project Company is responsible for providing medical examinations and maintaining medical records of personnel.
  - b. Code of Safe Practices and Injury and Illness Prevention Programs (IIPP), i.e., SB 198, 8 CCR and CAL/OSHA, GISO 3203, Section 5192 and 1509.
  - c. Personnel air monitoring according to 29 CFR and 8 CCR.
  - d. The Construction Standard (29 CFR 1926).
  - e. Federal and California Lead Standards for the Construction Industry (29 CFR, Part 1926.62 and 8 CCR, Section 1532.1, respectively)
  - f. Asbestos OSHA Regulation 29 CFR Part 1926.1101 & 8 CCR 1529.
  - g. Workers' Right to Know (29 CFR 1910.120).
  - h. Section 6360-99 of the California Labor Code (Hazard Communication).
  - i. The American with Disabilities Act (ADA).
8. Engineering controls, specific Work practices, air monitoring for contaminants (e.g., dust, natural occurring asbestos (NOA), serpentine, lead, volatile organic, and hydrocarbons), and personal protective equipment (8 CCR 5144) to protect Principal Project Company personnel, City personnel on the Site, and the public impacted by the Work.
9. Methods to be used to decontaminate equipment and personnel.
10. Sanitation facilities to be provided for personal hygiene. Portable toilets and discharge of their waste products into sanitary sewers shall comply with local codes.
11. Contingency /Emergency Response Plan procedures for emergencies including fire, spillage of hazardous/toxic wastes and liquids (with special emphasis to clean up of spillage due to fuel/oil from Principal Project Company's equipment), traffic accident, personal accident, power failure, or any event that may require modification or abridgment of site control and decontamination procedures.

Part Two of HASP—Construction Safety:

12. Principal Project Company shall include an organizational structure in the HASP that sets forth lines of authority, responsibility, and communication, including a description of Principal Project Company's organization and Project responsibilities of key personnel.
13. Principal Project Company shall inform its employees, supervisory personnel and visitors (invitees) to the Project Site of known Project Site hazards.
14. Principal Project Company shall take necessary precautions and implement mitigation measures to prevent or reduce the release of pollutants in the form of dust, fume, mists, excessive noise and vibration into the air and surrounding environments.

15. Principal Project Company shall ensure at least one individual on each job site always has current CPR/First Aid/AED training.
16. Principal Project Company shall employ a Project-specific hard hat insignia (sticker) program which identifies workers that have successfully completed the Project safety training.
17. Information identifying and delineating all workplace safety hazards and how this information is communicated to employees (e.g., tailgate/toolbox safety meetings, monthly safety meetings, daily job briefing).
18. Principal Project Company shall at all time be responsible for providing its employees and visitors with the proper level of personal protective equipment (PPE), that shall be appropriate to the type of work being performed by the individual employee. At a minimum, Principal Project Company, Principal Project Company's personnel and visitor shall wear hardhats, ANSI class 2 vests, and safety glasses with side shields at the work site. Hardhats shall show company name.
19. Safety Action Measures: For Work requiring Cal/OSHA permits, special training and/or use of designated competent persons to oversee the Work, Principal Project Company shall prepare Safety Action Measures, to address these Work activities. The Safety Action Measures shall include detail information needed to perform the activity safely, verify that the persons involved in the Work are properly trained or certified, the equipment used is inspected and suitable for the Work, the proper permits have been obtained.
20. The format for all safety forms and reports shall be developed by Principal Project Company and submitted as part of Principal Project Company HASP.
21. Periodic safety performance reviews and procedures on safety inspections. A sample daily inspection form shall be provided in Principal Project Company's HASP and shall include date, Work area checked, employees present in the Work area, PPE, Work equipment being used in each area, safety and health issues, notes.
22. Procedures in handling non-compliance/violations of safety requirements, e.g. deficiency correction reports, stop Work orders, disciplinary actions, etc.
23. Communication and reporting requirements, including the immediate reporting of injury accidents and submittal of corrective action reports.
24. Requirements concerning, distribution, and maintenance of personal protective equipment and safety tools.
25. Measures and procedures to be used to report, monitor and control exposure of Principal Project Company personnel and public to any identified safety hazards. Principal Project Company shall monitor Site personnel for contaminant exposure and ensure appropriate PPE is used.
26. Provision for all personnel to be properly and regularly trained in construction safety and emergency response. The level of training required for all or specified Principal Project Company or Principal Project Company personnel, including, but not limited to the following:
  - a. Heat stress
  - b. Fire prevention and protection plan
  - c. Fall protection and prevention program

- d. Confined Space Entry
  - e. Special Equipment
  - f. Ergonomics
  - g. Contingency Plan for emergency including fire, earthquake, etc.
27. Site Access Control Plan covering Principal Project Company and City personnel, consultants, representatives, the public, and Project Site visitors (see relevant subparagraph 1.14 CONSTRUCTION SITE VISITORS).
  28. Construction site visitor guidelines, including the site-specific orientation and Project Site Visitor Policy form (see relevant subparagraph 1.14 CONSTRUCTION SITE VISITORS).
  29. Principal Project Company's alcohol and substance abuse program shall describe the measures that Principal Project Company will implement to ensure that all Principal Project Company personnel working on the Project comply with the drug and alcohol restrictions stated in this Agreement and in Principal Project Company's Corporate Policy and Program. Principal Project Company's and Principal Project Company's personnel shall not use any alcohol or controlled substance when performing the Work, and Principal Project Company shall not allow any person on the Project Site who is under the influence of any alcohol or controlled substance, including any prescription the negatively affects alertness or performance.
  30. Completed Activity Hazard Analysis (AHA) or Job Hazard Analysis (JHA) submitted with the HASP using the AHA/JsHA template for all significant activities and tasks with a high-risk potential, describing the job steps, hazards associated with each job step, and the controls used to remove or minimize the associated hazards.
  31. Activity Hazard Analysis (AHA):  
[https://www.navfac.navy.mil/content/dam/navfac/NAVFAC%20Atlantic/NAVFAC%20Southeast/PDFs/Safety/se\\_sf\\_activity\\_hw\\_trn.pdf](https://www.navfac.navy.mil/content/dam/navfac/NAVFAC%20Atlantic/NAVFAC%20Southeast/PDFs/Safety/se_sf_activity_hw_trn.pdf)
  32. Job Hazard Analysis (JHA) Form: <https://www.osha.gov/Publications/osha3071.pdf>
- H. Furnish copies of all records of all health and safety audits, inspections, and reviews to the City's Authorized Representative
  - I. The City reserves the right to require that Principal Project Company modify the HASP to address Project Site safety issues. However, the City's action or lack thereof on the HASP shall not be construed to mean approval, or acceptance of Principal Project Company's responsibility for compliance with the applicable laws and regulations.
- 1.6 INJURY AND ILLNES PREVENTION PROGRAM (IIPP) AND CODE OF SAFE PRACTICES (CSP)**
- A. Principal Project Company shall submit an Injury and Illness Prevention Programs (IIPP) and Code of Safe Practices (CSP) in accordance with this specification, CCR Title 8 and other applicable regulations. A copy of all applicable IIPP and CSPs must always be on-Site.
  - B. The City will not review IIPPs or CSPs for their content, nor will the City be liable for Principal Project Company's failure to have adequate IIPPs/CSPs or implement them. Submission to and receipt of IIPPs/CSPs to the City and regulatory agencies neither constitutes to the legality of the IIPPs/CSPs nor does it incur liability. Submission and receipt of IIPPs/CSPs to the City, or any review of the IIPPs/CSPs by the City, shall not be construed as approval of Principal Project Company's IIPPs/CSPs or any safety measures taken in or near the construction site.

- C. Any changes or modifications to Principal Project Company's IIPP/CSP must be submitted to the City. The modification shall be appended to the appropriate IIPP/CSP. All on-site personnel shall be fully informed of the modifications, changes, and required actions prior to conducting any additional work activities.

#### **1.7 REQUIREMENTS OF THE PROJECT SAFETY REPRESENTATIVE**

- A. Principal Project Company shall designate in writing a responsible competent person at the Project Site as Project Safety Representative (PSR) whose principal duties shall be the prevention of accidents and the maintenance and supervision of safety precautions and programs in accordance with the requirements of applicable laws and regulations. The PSR is also a qualified person having the necessary training to be knowledgeable in the identification, control, and management of the hazardous materials encountered onsite.
- B. Principal Project Company's Project Safety Representative (PSR) shall:
  - 1. Be readily available (within 30 minutes of City request) to consult with the City at the site during all Project working hours and shall be available 24 hours a day, 7 days a week by telephone or other approved means. The PSR shall meet with the City at least once per week.
  - 2. Have completed a 30-hour OSHA Certified Construction Safety training session and must submit documentation of such training to the City.
  - 3. Have completed the 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) Training Program
  - 4. If more than one Project site working shift is initiated, Principal Project Company shall ensure that provisions are made to have a qualified PSR to cover all Work shifts
  - 5. Be knowledgeable with the safety provisions of Federal OSHA, Cal/OSHA and the requirements of this section.
  - 6. Be currently certified in First Aid/CPR and be able to use an automatic external defibrillator (AED).
  - 7. Possess qualifications, which include a minimum of three (3) years recent experience in conducting and supervising safety and health programs on construction projects like this Contract.
  - 8. Be capable of performing safety inspections and accident investigations.
  - 9. Perform twice daily inspections of their active field Work area(s) covering workplace conditions, physical facility safety, and employee Work practices. Any deficiencies and corrective actions shall be documented. Furnishing of daily inspection reports shall be done as incidental work. The PSR shall meet on-site with the City at least once per week.
  - 10. Administer and enforce the site-specific Health and Safety Plan, Injury and Illness Prevention Plan (IIPP), and Code of Safe Practices (CSP).
  - 11. Administer and enforce the visitor site-specific safety orientation, the Project Site Visitor Policy and its guidelines.
  - 12. Advise Principal Project Companies, vendors, and visitors to the job site of potential hazards and the requirements of Health and Safety practices and rules.

13. Coordinate Principal Project Company's Work regarding hazardous material procedures and controls (as required).
14. Establish and maintain restricted Work Areas.
15. Enforce proper use of personal protective equipment.
16. Communicate approved modified safety requirements to Project Site personnel as well as visitors to the site.
17. Notify to and coordinate with the City for the immediate assessment and remediation Work for unforeseen hazardous materials conditions discovered in the course of the Work.
18. Have "Stop Work Authority" – the ability to stop Work without any adverse consequences when unsafe conditions are present.

#### **1.8 REQUIREMENTS OF THE ASBESTOS COMPETENT PERSON**

- A. Principal Project Company shall designate in writing a responsible asbestos Competent Person (ACP) at the Project Site whose principal duties shall be overseeing asbestos soil disturbing activities, implementing engineering and administrative controls to prevent asbestos from becoming airborne, and general compliance with Cal/OSHA, CARB, and EPA regulations related to asbestos and naturally occurring asbestos (NOA) when impacted as part of the Project. The ACP is also a qualified person having the necessary training and experience to be knowledgeable in the identification, control, and management of asbestos and naturally occurring asbestos encountered onsite. The PSR and ACP may be the same person if all training and experience requirements for both positions are met.
- B. Principal Project Company's Asbestos Competent Person (ACP) shall:
  1. Communicate all NOA-related issues to the PSR daily and as needed as required for the PSR to fully execute its duties.
  2. Have completed 40-hour Cal/OSHA-required asbestos Principal Project Company supervisor training and must submit documentation of such training to the City.
  3. Possess qualifications, which include a minimum of three (3) years recent experience as an ACP on construction projects similar to this Contract.
  4. Implement the elements of Cal/OSHA asbestos in construction standard 8 CCR §1529 and other applicable regulations and standards, including but not limited to:
    - a. Demarcate the Regulated Areas and control the points of ingress and egress,
    - b. Conduct asbestos worker training to all workers in Cal/OSHA Regulated Areas, and NOA awareness training to all workers and visitors who enter the site and are outside of the Regulated Areas,
    - c. Assure that wet methods and other engineering controls are implemented to minimize asbestos emissions,
    - d. Conduct the Initial Exposure Assessment and select respiratory protection accordingly, as required,
    - e. Conduct daily personal monitoring and communicate exposure results to workers,

- f. Based on monitoring results, continuously re-evaluate PPE requirements select the appropriate respiratory protection to prevent exposure above the PEL,
  - g. Assure that personal decontamination stations are adequate and located to allow workers to decontaminate thoroughly prior to exiting the Regulated Areas. The decontaminate stations shall include water and boot scrubs, HEPA-vacuums, cleaning wipes for respirators, and facilities to dispose of used Tyvek.
5. Perform twice daily inspections of asbestos and NOA field work area(s) for compliance with all asbestos and NOA regulations and standards. Any deficiencies and corrective actions shall be documented.
  6. Have "Stop Work Authority" – the ability to stop work without any adverse consequences when unsafe conditions are present.

### **1.9 TRENCHING AND SHORING**

- A. Trench Safety: Principal Project Company shall comply with all shoring and excavation requirements set out in Federal OSHA (29 CFR 1926.650-652), Cal/OSHA (Construction Safety Order 1539-1544), the California Labor Code, and the Contract Documents.
- B. Federal and State Safety regulations requires
  1. Safe Exits: A stairway, ladder, ramp or other safe means of egress shall be in trench excavations that are 4 feet or more in depth to require no more than 25 feet of lateral travel for employees.
  2. Shoring is required for trenches at 5 feet depth or greater, and must be designed to prevent cave-ins. Shoring may be required for trenches less than 5 feet in depth unless excavations are made entirely in stable rock or examination of the ground by a competent person provides no indication of a potential cave-in.
  3. Keep excavated materials at least 2 feet or greater from the side of the excavation.

### **1.10 CONFINED SPACE ENTRY**

- A. Principal Project Company shall provide all equipment and assistance to make the confined space safe for entry by Principal Project Company's personnel, the City representatives, and its consultants in accordance with the California Code of Regulations, Title 8, General Industry Safety Orders, "Confined Spaces."
- B. If any activities associated with confined space entry become necessary, Principal Project Company shall be required to consult the City for guidance and prepare an appropriate Permit-Required Confined Space Entry Plan.

### **1.11 ELECTRICAL LOCKOUT/TAGOUT PROCEDURES**

- A. Training of Principal Project Company's employees in procedures for locking out and tagging out of electrical equipment that must be de-energized to accommodate the Work.
  1. The lockout/tag out of electrical energy sources shall occur at the circuit disconnect switch in all cases.
  2. Principal Project Company shall furnish locks used for this purpose.
  3. Principal Project Company shall furnish tags, locks, and lock box(s) that are compatible with electrical distribution equipment to be de-energized.

- B. Principal Project Company shall attach white "DANGER" tags to locked switches to indicate that the circuit must not be energized.
- C. Red "DANGER" tags shall be used to indicate that Principal Project Company personnel are actively working on equipment or lines connected to the locked switch. If the task that requires locking the switch has not been completed at the end of a shift or workday, Principal Project Company shall leave the switch lock in place, remove its Red Tag, but leave the White Tag in place on the locked circuit. When Principal Project Company resumes that Work, Principal Project Company shall again attach a Red Danger tag to the locked switch

#### **1.12 CONSTRUCTION EQUIPMENT AND TOOLS**

- A. Principal Project Company shall only use construction equipment and tools designed and intended by the manufacturer for the Work. All Principal Project Company equipment shall conform to Cal/OSHA requirements.
- B. Principal Project Company shall not use and remove from the Project Site at its expenses any equipment that the City as Regulator determines is unsafe, not intended for the Work, or that does not meet Cal-OSHA requirements.

#### **1.13 PERSONAL PROTECTIVE EQUIPMENT (PPE)**

- A. Principal Project Company shall define task-specific PPE requirements for all personnel and visitors in compliance with applicable laws, rules, and regulations. PPE shall always be worn on the Site, including travel within the Project Site when starting or ending shifts. Minimum requirements include:
  - 1. Hard hats are always required at the Site. Hardhats shall show company name.
  - 2. Appropriate eye and face protection that complies with ANSI Z87 shall always be worn.
  - 3. Safety glasses with side shields are required at the Site.
  - 4. Sensible and safe Work clothing and closed-toe shoes must be worn at the Site.
  - 5. No canvas/leather sneakers or sandals may be worn in the project work areas.
  - 6. Appropriate hearing protection shall be worn at the Project Site where sound levels exceed Cal/OSHA standards.
  - 7. Suitable gloves must be worn to protect the hands from injury as required by Cal/OSHA.
  - 8. High visibility warning vests (ANSI class 2 vests) or other suitable garments marked with or made of reflection or high-visibility material must always be worn at the Site.
  - 9. Within a Cal/OSHA asbestos Regulated Areas, suitable protective clothing and respiratory protection in accordance with 8 CCR § 1529 as prescribed by the Asbestos Competent Person (ACP).
- B. Principal Project Company's PSR and/or ACP shall establish additional appropriate levels of protection for each Work task in accordance with Cal/OSHA standards.
- C. If respiratory protection is utilized, Principal Project Company shall implement a Respiratory Protection Program in accordance with Cal/OSHA requirements. Principal Project Company will also provide the following to the City prior to beginning any portion of Work that requires respiratory protections:
  - 1. Copies of the Respiratory Program

2. Respirator training records
  3. Fit-testing and medical approval documentation
  4. Annual documentation for training, fit testing and medical evaluations
- D. Principal Project Company shall provide appropriate respiratory equipment to its personnel and visitors. Principal Project Company shall inspect and maintain equipment in accordance with Cal-OSHA regulations.
- E. Where “Hot Work” is involved, a Hot Work permit must be submitted to the City as Regulator prior to commencing that Work. Personnel performing Hot Work must wear clothing that provides thermal protection. Principal Project Company shall erect welding screens where welding operations may expose its personnel or the public to welding sparks, light and other hazards.
- F. Safety harnesses must be worn by personnel in manlifts and when working at heights, in accordance with OSHA requirements in manlifts.
- G. Workers must wear a safety harness with their safety lanyard secured to a separate lifeline while working from swing scaffolds, boatswain’s chairs, or other suspended Work platforms that present a fall hazard.

**1.14 PROJECT SITE VISITORS**

- A. All Project Site visitors upon arrival must check in with Principal Project Company’s Project Safety Representative (PSR). Visitors are defined as persons who are not assigned as direct staff or employees of Principal Project Company. The PSR will coordinate a site-specific safety orientation prior to jobsite entry. The site-specific safety orientation shall provide visitors with a review and understanding of safe jobsite procedures and practices, including any safety trainings if required. Principal Project Company’s site-specific safety orientation, at a minimum, shall include discussion of:
1. Required personal protective equipment (PPE)
  2. Site access/egress routes (Site Access Control Plan)
  3. Emergency contacts and procedures
  4. First-aid locations
  5. Potential known hazards
  6. Required safety trainings and procedures
  7. Construction site operations and conditions
- B. Following the site-specific safety orientation, visitors must complete and sign a construction site visitor policy form provided by Principal Project Company. Failure to acknowledge and agree to all requirements of the construction site visitor policy form shall result in denied access to the construction work zone. The visitor policy form, at a minimum, shall require visitors to accept and acknowledge that they:
1. Have received and understand the site-specific safety orientation
  2. Must not handle or utilize any job equipment, tools, or materials at any time

3. Must always wear proper PPE (Principal Project Company is responsible for providing any missing PPE to visitors)
  4. Must attend any required safety trainings
  5. Must observe and comply with construction signage, barricades, and operations
- C. All visitors re-visiting jobsites shall be identified with a visitor sticker provided by Principal Project Company. Principal Project Company shall be responsible for providing and maintaining legible stickers. Visitor stickers shall indicate the visitor's name, the date of the site-specific safety orientation, and the project number. Principal Project Company's PSR is responsible for determining if any additional re-training is required to account for changing site conditions and procedures.
- D. The City and Principal Project Company shall reserve the right to remove any visitor from the jobsite at any time, if he or she feels that the visitor is failing to adhere with the on-site safety requirements. Areas open to public access (e.g. sidewalks/designated paths of travel) are exempt from the Project Site Visitor Policy.

#### **1.15 EMERGENCY EQUIPMENT**

- A. Principal Project Company shall provide emergency and first aid equipment required by Cal-OSHA and other applicable regulations and necessary for the Project. The following items, at a minimum, shall be maintained at the Project Site and available for immediate use:
1. First aid equipment and supplies, including first aid kits and eyewash station per Cal/OSHA standards
  2. Spill control materials and equipment, including multi-purpose absorbent materials, poly bags, brooms and shovels and drums (if applicable)
  3. Fire extinguishers with a minimum rating of 2A-10B:C and as required by Cal/OSHA standards for scope of Work requirements
  4. Emergency rescue equipment including SCBA and tripod/extraction equipment for confined space rescue; backboard/basket for transport of injured personnel, air horns/bull horns for emergency signaling and communications (as applicable to the Work).
  5. All Principal Project Company's boats and vessels used on the project shall comply with the U.S. Coast Guard and Cal/OSHA and all applicable regulations for working in/around water and waterways.

#### **1.16 HAZARDOUS MATERIALS ENCOUNTERED AT THE SITE**

- A. Proposition 66 Warning: Many of the materials and items at the Project Site contain materials known to the State of California to be either carcinogenic, reproductive toxins, or that may be otherwise toxic or hazardous.
- B. Principal Project Company shall ensure that all personnel, including Principal Project Company's personnel, receive appropriate training and orientation concerning toxic and hazardous materials that will prevent inadvertent or unauthorized disturbance of hazardous materials present at the Site.
- C. Principal Project Company shall comply with all applicable requirements of the California Code of Regulations, Title 8, Section 1532.1, "Lead in Construction".

- D. Principal Project Company shall take necessary precautions to prevent the release of lead and/or asbestos in the form of dust, fumes or mists from lead-containing and asbestos-containing materials into the air or into surrounding environments.
- E. Principal Project Company shall inform all workers, supervisory personnel and authorized visitors to the Project Site of the potential hazards of lead and asbestos and of necessary precautions and housekeeping procedures to reduce the potential for exposure in areas where lead or asbestos is known to be present.

#### **1.17 HAZARDOUS MATERIALS THAT MAY BE INCORPORATED INTO THE WORK**

- A. Principal Project Company shall maintain copies of Safety Data Sheets (SDS) for all substances used at the Project Site or incorporated into the Work.
- B. Principal Project Company shall be responsible for coordinating the exchange of SDS or other hazard communication information that is required to be made available at the site.
- C. Principal Project Company shall notify the City if a specified product or piece of equipment, or the intended use of such product or equipment is unsafe, prior to ordering such items or incorporating such items into the Work.
- D. Principal Project Company shall be responsible for complying with all BAAQMD regulations regarding the use, documentation and notification procedures related to asbestos-related construction Work, use of aerosol products and products that are with the limits for Volatile Organic Compounds (VOC's) and other limits for compounds regulated by BAAQMD.

#### **1.18 MEETINGS**

- A. Principal Project Company shall conduct regular trainings for its personnel, including but not limited to "toolbox/tailgate" safety meetings, in accordance with Cal/OSHA requirements. Principal Project Company shall document the date, time, subject addresses, and names of persons who attended any training meetings using the Safety Meeting Attendance sheet, which Principal Project Company shall keep on file.
- B. Principal Project Company's Project Manager, Superintendent(s), and PSR shall attend Weekly Project Coordination Meetings (as required) to review the project's Immediately Dangerous to Life and Health (IDLH) actives, stop Work activities, incidents, and incident investigations.

#### **1.19 LOGS, REPORTS, AND RECORDKEEPING**

- A. Principal Project Company shall maintain Project safety audits, employee training records and certifications, equipment safety inspection logs, incident reports, visitor logs and all reports covering the implementation of Principal Project Company HASP at the Project Site for review upon request by the City.
- B. Principal Project Company shall submit Monthly project safety statistics, which shall include Project safety inspections, hours worked by Principal Project Company, OSHA Recordable Incidents, Incident Rates, Lost Work Day Cases, Total Project Lost Work Days, Days Away from Work Rate, First Aid Cases, and Property Damage Incidents, to City as part of the Monthly Progress Status Report.
- C. Principal Project Company shall provide the City access to the Project Site, and to all logs and records concerning the Work. The City's review of Principal Project Company's logs and records documenting its safety performance shall not be construed as approval or waiver of the adequacy of any safety measures taken in, on, or near the Project Site. The City's review of Principal Project Company's logs and records shall not relieve Principal Project Company of its responsibilities of performing and enforcing health and safety inspections/audits, monitoring, or any other components of the Project safety requirements or Principal Project Company's HASP,

and any liability that may arise from Principal Project Company's performance or failure to perform safety Work.

#### **1.20 REMEDIAL ACTION**

- A. The City will issue a notice of non-compliance if City personnel observe any condition at the Project Site that poses an immediate and serious risk to the life or health of persons at the Site, or if City personnel observe that Principal Project Company has failed to timely correct violations of health or safety standards. The notice will document the facts and circumstances of non-compliance and will require Principal Project Company to immediately remedy and correct the non-compliance and confirm in writing within 24 hours of receipt of the notice that the non-compliant conditions described in the notice have been corrected.
- B. If Principal Project Company repeatedly fails to comply with applicable health and safety laws, rules, regulations, and orders, the City reserves the authority to have the necessary Work performed by others and deduct corresponding costs from Principal Project Company's progress payment(s); suspend progress payments; or terminate the contract for cause.
- C. Principal Project Company's non-compliance with applicable health and safety laws, rules, regulations, orders, and contract safety requirements may be deemed breach of contract, for which the City may suspend the Work, and dismiss from the Work any employee of Principal Project Company, Principal Project Company, or Supplier responsible for the non-compliance, as provided in the General Provisions. Principal Project Company shall bear all costs arising from such suspension of Work or dismissal of employee(s).
- D. Principal Project Company shall not create any condition that endangers the safety of any person on the Project Site, including City employees, Principal Project Company employees, City consultants, and the public. If City personnel observe such a condition, the City is authorized to suspend the Work until the condition is corrected. Such order to suspend the Work shall not impose on the City any obligation, penalty, additional costs or assumption of liability of any kind. Contract Time shall not be extended by such suspension, and Principal Project Company shall be solely responsible for and the City shall not compensate Principal Project Company for any delay caused by a suspension of the Work due to unsafe conditions. Any suspension of Work due to unsafe conditions shall not relieve Principal Project Company of its control of the Project Site or responsibility for safety on the Project Site during the period the Work is suspended.

#### **1.21 INCIDENT REPORTING AND INVESTIGATION**

- A. Principal Project Company personnel who are involved in or witness an unsafe condition at the Project Site or a Reportable Incident (as defined by Cal-OSHA) shall immediately report the condition or incident to Principal Project Company's Project Site supervisor or foreman, who in turn shall immediately notify the City's Authorized Representative.
- B. Principal Project Company personnel who are involved in or witness a near-miss incident must report it to the responsible Project Site supervisor or foreman within a reasonable time frame, not to exceed 24 hours, who in turn shall immediately notify the City's Authorized Representative.
- C. Principal Project Company shall allow City to participate and review all Project incident or near-miss investigations.
- D. Principal Project Company's foremen, superintendents, and managers shall not decline to accept or relay a report of injury or significant near-miss incident from any person.
- E. All incidents and significant near-miss incidents shall be investigated immediately by Principal Project Company's designated Project Safety Representative (PSR).

- F. For all incidents and near miss incidents (“near miss”), Principal Project Company shall submit to the City a Preliminary Incident/Near Miss Investigation Report (PIR) within 24 hours of the incident or near miss. Principal Project Company shall submit a Final Incident/Near Miss Investigation Report (FIR) as soon as possible (generally within 48 hours) after incident or near miss. Principal Project Company shall not perform Work in the area or of a type that poses risks similar to those of the incident or near miss until a Corrective Action Report (CAR) is complete and submitted to the City.
- G. The PIR and the FIR shall include at a minimum the following:
1. What happened? Include interviews with injured workers and witnesses as well as examination of the workplace for factors associated with the incident or near miss.
  2. Why did the incident or near miss happen? Identify the root causes of the incident or near miss. Root causes are the underlying or systemic, rather than the generalized or immediate, causes of an incident/near miss. To identify root causes, the investigation must obtain all the facts surrounding the occurrence and then ask why. For example, what caused the situation to occur; who was involved; was/were the employee(s) qualified to perform the functions involved in the incident or near miss; were they properly trained; were proper operating procedures established for the task involved; were procedures followed, and if not, why not; where else this or a similar situation might exist, and how it can be corrected.
  3. What should be done? The investigation must determine all corrective actions required to eliminate the cause(s) of the incident or near miss.
  4. What action has been taken and what remains to be taken? Document actions already taken to reduce or eliminate the exposures being investigated. Document all interim or temporary precautions. Document any pending corrective action and reason for delaying its implementation.
  5. Principal Project Company shall submit to the City a Corrective Action Report (CAR) that documents that all corrective actions have been completed and fully implemented and all job site hazards and behaviors that caused the incident or near-miss incident have been corrected. The CAR shall include certification signed by an authorized Officer of Principal Project Company as to the completeness and accuracy of the FIR and the CAR.

## **1.22 ACCIDENT DOCUMENTATION AND REPORTING**

- A. If an accident causes death, serious injury, or serious property damage, Principal Project Company shall immediately report the accident to the City’s Authorized Representative by telephone, text message or email and to appropriate authorities (for example, Cal-OSHA).
- B. In addition, Principal Project Company shall promptly report in writing to the City all accidents or near-miss incidents whatsoever arising out of or in connection with, the performance of the Work whether on occurring on or adjacent to the Project Site or the Construction Area. Principal Project Company shall give full details of the facts and circumstances of the cause and nature of the incident including statements of witnesses.
- C. Principal Project Company shall make positive contact with City Authorized Representative. Voicemail does not constitute “positive contact.” Principal Project Company shall escalate from Project Manager to Project Director until positive contact is made immediately following an incident.
- D. Principal Project Company shall provide to the City within five working days of an incident or accident or near-miss incident or accident, a written incident or accident; or near-miss incident or a near-miss accident report. A significant accident is defined to include events where

personal injury is sustained, or property loss of substance is sustained, or where the event posed a significant threat of loss or personal injury.

- E. If any person lodges a claim against Principal Project Company or any Principal Project Company alleging injury or property damage arising from the Work, Principal Project Company shall promptly report the claim and all relevant facts concerning the claim in writing to the City.
- F. Principal Project Company is responsible for all documentation and reporting obligations of any accident and near-miss incidents in accordance with as per federal, State and local laws and regulations.

### **1.23 CITY SAFETY REPRESENTATIVE**

- A. The City may at any time and without notice enter the Project Site and inspect the Project Site and the Work, observe Principal Project Company's means and methods of performing the Work and maintenance of the Project Site, and review Principal Project Company's compliance with applicable safety requirements, regulations and laws, including but not limited to the requirements of this Agreement and Cal-OSHA regulations. The purpose of these inspections and observations is to confirm that Principal Project Company is safeguarding all people and property on the Project Site.
- B. If the City observes an unsafe Project Site condition or unsafe means or methods of performing Work, the City will inform Principal Project Company's Construction Manager or PSR, who shall take whatever actions Principal Project Company deems necessary to immediately remedy the unsafe Project Site condition or unsafe work practice, or unsafe means or methods in which the Work is performed. Principal Project Company shall within 24 hours of taking such remedial action submit a report to the Engineer describing the unsafe Project Site condition or work practice, and how Principal Project Company remedied that unsafe condition, unsafe work practice, or unsafe means and methods of performing the Work.
- C. The City's inspection of the Project Site and the Work, the City's observation of Principal Project Company's means and methods, and the City's requiring Principal Project Company remedy an unsafe Project Site condition, unsafe work practice, or unsafe means and methods of Work shall not in any way relieve Principal Project Company of control of and responsibility for the Site, and does not relieve Principal Project Company of its responsibility for the safety of all persons on the Project Site.

### **1.24 SFMTA HEALTH AND SAFETY REQUIREMENTS:**

- A. Principal Project Company shall comply with the following requirements as applicable and at no additional cost to the City, if any part of the work for this job is under the jurisdiction of the SFMTA and is on one of its facilities and/or affects its bus/train routes.
- B. Principal Project Company shall obtain all the necessary City and SFMTA permits, trainings, clearances, and shall schedule any necessary SFMTA support at least two weeks prior to mobilization.
- C. Principal Project Company employees who will perform Work within 72 inches (measured transversely) of SFMTA rail tracks shall first receive "Roadway Worker Protection" training and certification from the SFMTA, at least two weeks prior to mobilization. Principal Project Company shall schedule "Roadway Worker Protection" training by contacting the SFMTA. Principal Project Company shall sign a Hold Harmless Agreement with SFMTA with respect to the safety training.
- D. In addition, and at least two weeks prior to mobilization, Principal Project Company shall obtain a "Track Access Clearance Permit" from SFMTA's Operations Control Center (OCC) before

working within 72 inches of the rail tracks. Principal Project Company shall schedule the "Track Access Clearance Permit" training by contacting SFMTA.

- E. All Principal Project Company personnel performing Work along a trackway or adjacent to a trackway shall comply with any instruction given by SFMTA Operations Control Center (OCC).
- F. Principal Project Company is alerted to the presence of the Overhead Contact System (OCS). The overhead contact system is above each trolley coach route and track, and adjacent to each platform. This is a HIGH VOLTAGE SYSTEM operating in excess of 600 volts DC. Principal Project Company's attention is directed to Article 37 of the California Public Utilities Commission General Order 95. Cal/OSHA regulations require that any boom type equipment that moves vertically must maintain 10 feet radial clearance and any other equipment must maintain a 6 feet clearance from OCS. Principal Project Company shall use only fiberglass ladders when working around the OCS. Principal Project Company shall obtain "clearance to start work" from the SFMTA facility's supervisor when working within 10 feet of the OCS, at least two weeks prior to performing that Work.
- G. Principal Project Company shall comply with California Public Utilities Commission's General Order 175-A and the SFMTA "Roadway Worker Protection" training when performing any work on or near Muni trackways.
- H. Principal Project Company shall provide proof of health and safety training required by CCR, Title 8, Subsection 3203 (a)(7) and Muni Procedures SY.PR.034 – Principal Project Company Safety Program and SY.PL.003 – Roadway Worker Protection (RWP) Plan, for each employee, including employee name or other identifiers, training dates, type(s) of training and training provider. These documents are available for review and inspection from SFMTA.
- I. Principal Project Company shall during the course of the Work regularly provide tail-gate trainings to all employees working in and around tracks, track switches, overhead catenary system, train signal system, and other Project specific hazards, as required by Cal-OSHA regulations and other applicable laws and as topics related to safe performance of the Work and maintenance of Project Site safety come to the attention of Principal Project Company.
- J. Principal Project Company shall ensure that its employees, agents, and contractors provide and maintain personnel safety training and medical examinations in accordance with all applicable Federal, State, and local safety and health standards, rules, regulations, and orders.
- K. Principal Project Company shall acquire all the proper permits, trainings, clearances, and schedule any SFMTA support as necessary, at least two weeks prior to mobilization.
- L. Principal Project Company shall sign an Assumption of Risk/Waiver of Claims/Hold Harmless Agreement with SFMTA with respect to the operational and safety training.
- M. Cost for all the above requirements, permits, training, and clearances is incidental and inclusive of the base bid.

## **PART 2 - PRODUCTS (NOT USED)**

## **PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## SECTION 01 35 50 - ADDITIONAL ENVIRONMENTAL PROCEDURES

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. This Section includes additional environmental procedures and environmental mitigation measures derived from Project specific regulatory permits and/or CEQA compliance that Principal Project Company shall follow during construction.

This section includes:

1. Documentation of Historic Resource
2. Salvage Plan
3. Interpretation of Historic Resource
4. Oral Histories
5. Tribal Cultural Resources Preservation
6. Construction Transportation and Communications Management Plan
7. Driveway and Loading Operations Plan
8. Paleontological Evaluation and Monitoring Plan
9. Vibration Sensitive Equipment at 2601 Mariposa Street (KQED Building)

#### 1.2 DAMAGES FOR FAILURE TO MEET ENVIRONMENTAL REQUIREMENTS

- A. Principal Project Company shall be liable for all Federal, State, and local regulatory fines, penalties, liquidated damages and costs arising from any Principal Project Company failure to implement mitigation measures to control environmental impacts..

#### 1.3 PROJECT CONDITIONS

- A. Principal Project Company shall familiarize itself as to the actual site conditions that may be encountered during construction by all means available, including, but not limited to, the use of USGS geologic maps.
- B. Principal Project Company shall make provisions to ensure that environmental mitigation controls are consistently implemented for the project duration.
- C. Pursuant to California Assembly Bill 3180 (chapter 1232), the City Planning Department at its own discretion will monitor Principal Project Company's compliance with Code and Contract requirements, including required mitigation actions for construction impacts as indicated in the final MMRP, and will report on Principal Project Company's compliance with required mitigation controls. Said monitoring and reporting activities may include, but are not limited to, qualitative, quantitative and video observations and data collection on the impacts of noise, vibration air quality, traffic, street pavement damage, water quality, cultural resources, biological resources and hazardous materials.
- D. Principal Project Company shall cooperate with such monitoring activities, provide access to the Project Site and Construction Work areas to establish and secure monitoring stations, and make its facilities and records available to the City Planning Department for performing such monitoring.

- E. City will issue a Notice of Determination to Principal Project Company for any detected non-compliance with the provisions herein or of any environmentally objectionable acts and the corrective action to be taken. Failure to comply will result in an assessment of liquidated damages.

## **PART 2 - SUBMITTALS**

### **2.1 DOCUMENTATION OF HISTORICAL RESOURCE**

- A. Unless stated otherwise, the following must be submitted and approved by City Planning Department prior to issuance of a demolition permit. Principal Project Company shall undertake Historic American Building/Historic American Landscape Survey-like (HABS/HALS-like) documentation of the building features. Documentation shall be undertaken by a professional who meets the Secretary of the Interior's Professional Qualifications Standards for Architectural History, History, or Architecture (as appropriate) to prepare written and photographic documentation of the Potrero Trolley Coach Division Facility. Principal Project Company shall submit to the City Planning Department for approval the scope of the documentation which shall include the following elements:
  - 1. **Measured Drawings:** A set of measured drawings shall be prepared that depict the existing size, scale, and dimension of the historic resource. City Planning Department will accept the original architectural drawings or an as-built set of architectural drawings (e.g., plans, sections, elevations). City Planning Department will assist the consultant in determining the appropriate level of measured drawings.
  - 2. **HABS/HALS-Level Photographs:** Either HABS/HALS standard large-format or digital photography shall be used. All digital photography shall be conducted according to the latest National Park Service (NPS) standards. Photography shall be undertaken by a qualified professional with demonstrated experience in HABS/HALS photography. Photograph views for the data set shall include (i) contextual views, (ii) views of each side of the building and interior views, (iii) oblique views of the building, and (iv) detail views of the character-defining features. All views shall be referenced on a photographic key. This photographic key shall be on a map of the property and shall show the photograph number with an arrow to indicate the direction of the view. Historic photographs shall also be collected, reproduced, and included in the data set.
  - 3. **HABS/HALS Historical Report:** A written historical narrative and report shall be provided in accordance with the HABS/HALS Historical Report Guidelines. The written history shall follow an outline format that begins with a statement of significance supported by the development of the architectural and historical context in which the structure was built and subsequently evolved. The report shall also include architectural description and bibliographic information.
  - 4. **Video Recordation:** Prior to issuance of a demolition permit or site permit is issued, video documentation of the affected historical resource and its setting shall be conducted by a professional videographer, one with experience recording architectural resources. The documentation shall be narrated by a qualified professional who meets the standards for history, architectural history, or architecture (as appropriate) set forth by the Secretary of the Interior's Professional Qualification Standards (36 Code of Federal Regulations Part 61). The documentation shall include as much information as possible—using visuals in combination with narration—about the materials, construction methods, current condition, historic use, and historic context of the historical resource.

5. Softcover Book: All documentation will be reviewed and approved by the Planning Department's staff before any demolition or site permit is granted for the affected historical resource. A print-on-demand softcover book shall be produced that includes the content from the historical report, historical photographs, HABS/HALS photography, measure drawings, and field notes. The print-on-demand book shall be made available to the public for distribution. Principal Project Company shall transmit such documentation to the History Room of the San Francisco Public Library, San Francisco Architectural Heritage, the Planning Department, and the Northwest Information Center. Conduct outreach to identify other interested groups.

## **2.2 SALVAGE PLAN**

- A. Prior to any demolition that would remove character-defining features, Principal Project Company shall consult with the Planning Department as to whether any character-defining features that are proposed to be demolished may be salvaged, in whole or in part, during demolition. Principal Project Company shall make a good faith effort to salvage materials of historical interest to be utilized as part of the interpretative program).

## **2.3 INTERPRETATION OF THE HISTORICAL RESOURCE**

- A. Principal Project Company shall facilitate the development of an interpretive program focused on the history of the Project Site. The interpretive program should be developed and implemented by a qualified professional with demonstrated experience in displaying information and graphics to the public in a visually interesting manner, such as a museum or exhibit curator. Principal Project Company shall submit to the City Planning Department for approval an interpretive program plan prepared by a qualified consultant which shall include but not limited to:
  1. The proposed format and the publicly accessible location of the interpretive content, as well as high-quality graphics and written narratives.
  2. The proposal prepared by the qualified consultant describing the general parameters of the interpretive program shall be approved by City Planning Department prior to issuance of the architectural addendum to the site permit.
  3. The detailed content, media, and other characteristics of such an interpretive program shall be approved by City Planning Department prior to issuance of a Temporary Certificate of Occupancy.
  4. Installation of permanent on-site interpretive displays or screens in publicly accessible locations.
  5. Historical photographs, including some large-format photographs required by Article 2.1(A), may be used to illustrate the Project Site's history.
  6. Educational information for future visitors and occupants to learn about the property's historical themes, associations, and lost contributing features within broader historical, social, and physical landscape contexts.

## **2.4 ORAL HISTORIES**

- A. Principal Project Company shall undertake an oral history project on the resource that may include interviews of people such as former SFMTA employees, or other community members who may offer informative historic perspectives on the history and significance of the resource. The project shall be conducted by a professional historian in conformance with the Oral History Association's Principles and Best Practices (<https://www.oralhistory.org/principles-and-best-practices-revised-2018/>). In addition to transcripts of the interviews, the oral history project shall

include a narrative project summary report containing an introduction to the project, a methodology description, and brief summaries of each conducted interview. Copies of the completed oral history project shall be submitted to the San Francisco Public Library, Planning Department, and other interested historical institutions. The oral history project shall also be incorporated into the interpretative program (see Article 2.3).

## **2.5 TRIBAL CULTURAL RESOURCES PRESERVATION**

- A. During ground-disturbing activities that encounter archeological resources, if the City Planning Department determines that a significant archeological resource is present, and if in consultation with the affiliated Native American tribal representatives, the City Planning Department determines that the resource constitutes a tribal cultural resource (TCR) and that the resource could be adversely affected by the proposed project, the proposed project shall be redesigned so as to avoid any adverse effect on the significant tribal cultural resource, if feasible.
- B. If the City Planning Department, in consultation with the Principal Project Company, determines that preservation-in-place of the TCR would be both feasible and effective, then the archeological consultant shall prepare an archeological resource preservation plan (ARPP). Implementation of the approved ARPP by the archeological consultant shall be required when feasible.
- C. If the City Planning Department, in consultation with the affiliated Native American tribal representatives and the project sponsor team, determines that preservation-in-place of the TCR is not a sufficient or feasible option, then the project sponsor team shall implement an interpretive program of the TCR in consultation with affiliated Native American tribal representatives. An interpretive plan produced in consultation with affiliated Native American tribal representatives, at a minimum, and approved by the City Planning Department, would be required to guide the interpretive program. The plan shall identify proposed locations for installations or displays, the proposed content and materials of those displays or installation, the producers or artists of the displays or installation, and a long-term maintenance program. The interpretive program may include artist installations, preferably by local Native American artists, oral histories with local Native Americans, artifacts displays and interpretation, and educational panels or other informational displays.

## **2.6 CONSTRUCTION TRANSPORTATION AND COMMUNICATIONS MANAGEMENT PLAN**

- A. Principal Project Company shall submit to SFMTA the Construction Management Plan that shall include additional measures to further minimize disruptions to people walking and bicycling, transit, and emergency vehicles during construction. The additional measures include:
  - 1. To minimize parking demand and vehicle trips associated with construction workers, describe methods to encourage carpooling, bicycle, walk, and transit access to the Project Site by construction workers. These methods could include providing secure bicycle parking spaces, participating in free-to-employee and employer ride matching program from [www.511.org](http://www.511.org), participating in emergency ride home program through the City of San Francisco ([www.sferh.org](http://www.sferh.org)), and providing transit information to construction workers.
  - 2. To minimize construction impacts on access to nearby residence and businesses, provide nearby residences and adjacent businesses with regularly updated information regarding project construction, including construction activities, peak construction vehicles activities, travel lane closures, and parking lane and sidewalk closures. At regular intervals to be defined in the construction transportation management plan, a regular email notice will be distributed by Principal Project Company that would provide current construction information of interest to neighbors, as well as contact information for specific construction inquiries or concerns.

## **2.7 DRIVEWAY AND LOADING OPERATIONS PLAN (DLOP)**

- A. Principal Project Company to submit a Driveway and Loading Operations Plan (DLOP) to the City Planning Department for approval as a part of the application for the first temporary occupancy permit. The intent of the DLOP is to reduce potential conflicts between passenger and freight loading and transit operations, and between passenger and freight loading activities and people walking and bicycling, and other vehicles in the project vicinity, as well as to maximize reliance on onsite facilities to accommodate freight loading demand. The DLOP shall include:
1. Provisions to manage loading activities and driveway operations associated with the below-grade onsite loading spaces; and
  2. Provisions for assessing on-street commercial and passenger loading supply and protocol for expanding on-street supply, if needed; and
  3. Provisions for trash, recycling, and compost truck access and collection operations; and
  4. Provisions for resident move-in and move-out operations for the HCC; and
  5. Provisions for scheduling deliveries for SFMTA and IFM Principal Project Company using the onsite loading facilities; and
  6. Provisions for accommodating recurring deliveries such as UPS, Federal Express, and USPS within the onsite loading facilities.

## **2.8 PRECONSTRUCTION PALEONTOLOGICAL EVALUATION AND MONITORING PLAN DURING CONSTRUCTION**

- A. Principal Project Company shall engage a qualified paleontologist consultant as recommended by the Society of Vertebrate Paleontology standards (SVP 2010) and Best Practices in Mitigation Paleontology (Murphey et al. 2019), or as otherwise approved by City Planning Department, to develop a site-specific monitoring plan prior to commencing soil-disturbing activities at the Project Site. The Preconstruction Paleontological Monitoring Plan shall determine construction activities requiring paleontological monitoring based on those that may affect sediments with moderate sensitivity for paleontological resources. Principal Project Company shall submit the Preconstruction Paleontological Monitoring Plan to the City Planning Department for approval prior to issuance of any demolition permit. The plan shall include but not be limited to:
1. Project description.
  2. Regulatory environment; outline applicable federal, state and local regulations.
  3. Summary of sensitivity classification(s).
  4. Research methods, including but not limited to:
    - a. Field studies conducted by the approved paleontologist to check for fossils at the surface and assess the exposed sediments.
    - b. Literature Review to include an examination of geologic maps and a review of relevant geological and paleontological literature to determine the nature of geologic units in the project area.
    - c. Locality Search to include outreach to the University of California Museum of Paleontology in Berkeley.

5. Results which include a summary of literature review and finding of potential site sensitivity for paleontological resources; and depth of potential resources if known.
6. Recommendations for any additional measures that could be necessary to avoid or reduce any adverse impacts to recorded and/or inadvertently discovered paleontological resources of scientific importance. Such measures could include:
  - a. Avoidance: If a known fossil locality appears to contain critical scientific information that should be left undisturbed for subsequent scientific evaluation.
  - b. Fossil Recovery: If isolated small-, medium- or large-sized fossils are discovered during field surveys or construction monitoring, and they are determined to be scientifically significant, they should be recovered. Fossil recovery may involve collecting a fully exposed fossil from the ground surface, or may involve a systematic excavation, depending upon the size and complexity of the fossil discovery.
  - c. Monitoring: Monitoring involves systematic inspections of graded cut slopes, trench sidewalls, spoils piles, and other types of construction excavations for the presence of fossils, and the fossil recovery and documentation of these fossils before they are destroyed by further ground disturbing actions. Standard monitoring is typically used in the most paleontologically sensitive geographic areas/geologic units (moderate, high and very high potential); while spot-check monitoring is typically used in geographic areas/geologic units of moderate or unknown paleontological sensitivity (moderate or unknown potential).
  - d. Data recovery and reporting: Fossil and associated data discovered during soils disturbing activities should be treated according to professional paleontological standards and documented in a data recovery report. The plan should define the scope of the data recovery report.

## **2.9 STORMWATER MANAGEMENT ORDINANCE, STORMWATER CONTROL PLAN**

- A. Principal Project Company shall submit the Final Stormwater Control Plan to San Francisco PUC prior to submitting the Architectural building permit to the San Francisco Department of Building Inspection (SFDBI).

## **PART 3 - EXECUTION**

### **3.1 VIBRATION SENSITIVE EQUIPMENT AT 2601 MARIPOSA STREET (KQED HEADQUARTERS)**

- A. Prior to issuance of any construction permits (e.g.) site permit, demolition permit, etc.), Principal Project Company shall implement the following measures related to the KQED Headquarters located at 2601 Mariposa Street:
  1. Community Liaison
    - a. Designate and make available a community liaison to respond to vibration complaints from building occupants at the KQED Headquarters located at 2601 Mariposa Street.
    - b. Contact information for the community liaison shall be posted in a conspicuous location so that it is clearly visible to building occupants most likely to be disturbed.

- c. Provide notification, through the community liaison, to property owners and occupants at 2601 Mariposa Street at least 10 days prior to construction activities involving equipment that can generate vibration capable of interfering with vibration-sensitive equipment and inform them of the estimated start date and duration of vibration-generating construction activities.
- d. Equipment types capable of generating such vibration include an impact pile driver, or similar equipment, operating within 250 feet of the building or a vibratory roller, or similar equipment, operating within 125 feet of the building. If feasible, the project sponsor team shall identify potential alternative equipment and techniques that could reduce construction vibration levels. Alternative equipment and techniques may include, but are not limited to:
  - 1) Pre-drilled piles; and
  - 2) Caisson drilling; and
  - 3) Oscillating or rotating pile installation; and
  - 4) Jetting piles into place using a water injection at the tip of the pile could be substituted for driven piles, if feasible, based on soil conditions; and
  - 5) Static rollers could be substituted for vibratory rollers in some cases.
- e. If concerns prior to construction or complaints during construction related to equipment interference are identified, the community liaison shall work with the affected building occupants to resolve the concerns such that the vibration control measures would meet a performance target of the 65 VdB vibration level threshold for vibration sensitive equipment, as set forth by Federal Transit Authority. To resolve concerns raised by building occupants, the community liaison shall convey the details of the complaint(s) to the project sponsor team, such as who shall implement specific measures to ensure that the project construction meetings the performance target of 65 VdB vibration level for vibration sensitive equipment. These measures may include evaluation by a qualified noise and vibration consultant, scheduling certain construction activities outside the hours of operation or recording periods of specific vibration-sensitive equipment if feasible, and/or conducting ground-borne vibration monitoring to document that the project can meet the performance target of 65 VdB at specific distances and/or locations. Ground-borne vibration monitoring, if appropriate to resolve concerns, shall be conducted by a qualified noise and vibration consultant.

### **3.2 PALEONTOLOGICAL MONITORING DURING CONSTRUCTION**

- A. Principal Project Company's approved paleontologist consultant described above in Section 2.8 shall document the monitoring conducted according to the Preconstruction Paleontological Monitoring Plan (see subsection 2.8 of this Section) and any data recovery completed for significant paleontological resource finds discovered, if any. Principal Project Company's approved paleontologist shall submit a final monitoring report and any data recovery report to the City Planning Department for approval prior to the certificate of occupancy.

### **3.3 INADVERTENT DISCOVERY OF PALEONTOLOGICAL RESOURCES**

- A. Worker Awareness Training - Prior to commencing construction, and ongoing throughout ground disturbing activities (e.g., excavation, utility installation, etc.) the project sponsor team and/or their designee shall ensure that all project construction workers are trained on the contents of the Paleontological Resources Alert Sheet, as provided by the City Planning Department. The Paleontological Resources Alert Sheet shall be prominently displayed at the

construction site during ground disturbing activities for reference regarding potential paleontological resources.

- B. In addition, the project sponsor team shall inform the contractor and construction personnel of the immediate stop work procedures and other procedures to be followed if bones or other potential fossils are unearthed at the project site. Should new workers that will be involved in ground disturbing construction activities begin employment after the initial training has occurred, the construction supervisor shall ensure that they receive the worker awareness training as described above.
- C. The project sponsor team shall complete the standard form/affidavit confirming the timing of the Paleontological Resources worker awareness training to the City Planning Department. The affidavit shall confirm the project's location, the date of training, the location of the informational handout display, and the number of participants. The affidavit shall be transmitted to the City Planning Department within five (5) business days of conducting the training.
- D. In the event of the discovery of an unanticipated paleontological resource during construction, Principal Project Company shall temporarily halt ground disturbing activities within 25 feet of the find until the discovery is examined by a qualified paleontologist as recommended by the Society of Vertebrate Paleontology standards (SVP 2010) and Best Practices in Mitigation Paleontology (Murphy et al. 2019). Work within the sensitive area shall resume only when deemed appropriate by the qualified paleontologist in consultation with the City Planning Department.
- E. The qualified paleontologist shall determine:
  - 1. If the discovery is scientifically significant; and
  - 2. The necessity for involving other responsible or resource agencies and stakeholders, if required or determined applicable; and
  - 3. Methods for resource recovery.
- F. If the qualified paleontologist determines that the discovery is not scientifically important, the qualified paleontologist shall document this conclusion in a Paleontological Evaluation Letter to demonstrate compliance with applicable statutory requirements (e.g., Federal Antiquities Act of 1906, CEQA Guidelines Section 15064.5, California Public Resources Code Chapter 17, Section 5097.5, Paleontological Resources Preservation Act 2009). Principal Project Company shall submit the Paleontological Evaluation Letter to the City Planning Department for review within 30 calendar days of the discovery.
- G. If the qualified paleontologist determines that the discovery is of scientific importance, and there are no feasible measures to avoid disturbing this paleontological resource, the qualified paleontologist shall prepare and submit to the City Planning Department for approval a Paleontological Mitigation Program. The mitigation program shall include measures to fully document and recover the resource of scientific importance. The qualified paleontologist shall submit the mitigation program to the City Planning Department for review and approval within 10 business days of the discovery. Upon approval by the City Planning Department, ground disturbing activities in the project area shall resume and be monitored as determined by the qualified paleontologist for the duration of such activities. The mitigation program shall include:
  - 1. Procedures for construction monitoring at the Project Site.
  - 2. Fossil preparation and identification procedures.

3. Curation of paleontological resources of scientific importance into an appropriate repository.
  4. Preparation of a Paleontological Resources Report (report or paleontology report) at the conclusion of ground disturbing activities.
- H. If a Paleontological Mitigation Program is required, Principal Project Company shall prepare and submit a Paleontological Resources Report to the City Planning Department for review within 30 calendar days from consultation of the ground disturbing activities, or as negotiated with the City Planning Department. The report shall include:
1. Date of field work; and
  2. Results of monitoring; and
  3. Fossil identifications to the lowest possible taxonomic level; and
  4. Analysis of the fossil collection; and
  5. Conclusions; and
  6. Locality forms; and
  7. An itemized list of specimens; and
  8. Repository receipt from the curation facility.
- I. Principal Project Company shall be responsible for the preparation and implementation of the mitigation program, in addition to any costs necessary to prepare and identify collected fossils, and for any curation fees charged by the paleontological repository. The paleontology report shall be submitted to City Planning Department for review within 30 business days from conclusion of ground disturbing activities, or as negotiated following consultation with City Planning Department.

**END OF SECTION**

## SECTION 01 50 00 - TEMPORARY FACILITIES AND CONTROLS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. This Section includes the following:
  - 1. Principal Project Company shall provide and maintain construction facilities and temporary controls as required to perform the D&C Work relocate as required by the progress of the Work.
  - 2. Unless otherwise required by the City, materials for construction facilities and temporary controls may be new or used, and shall be suitable for the purposes intended.
  - 3. Materials, installation and maintenance of construction facilities and temporary controls shall comply with applicable regulatory requirements.
  - 4. Principal Project Company shall maintain construction facilities in sound, neat and clean condition, and remove any graffiti and repair any vandalism to the satisfaction of the City.
  - 5. Principal Project Company shall remove construction facilities and controls, including associated utilities and equipment, when their use is no longer required.
- B. Related Sections:
  - 1. Section 01 77 00 - Closeout Procedures.

#### 1.2 OPERATION HOURS FOR TEMPORARY CONTROLS

- A. Principal Project Company shall provide and maintain temporary pumping, piping, power, lighting, controls, instrumentation, alarms, security devices, and all required safety devices at all times. Such items shall be made available for immediate use when Principal Project Company's operations impact existing systems.

#### 1.3 TEMPORARY ELECTRICITY

- A. Principal Project Company shall provide and pay for electrical service and weatherproof, grounded distribution system of sufficient size, capacity, and power characteristics during the construction period. Existing on-site City electrical facilities are not available for Contractor's use.

#### 1.4 TEMPORARY LIGHTING

- A. Principal Project Company shall provide and maintain lighting for Construction Work, including power to distribution boxes. Required illumination may be provided by approved cord sets with lamp guards. Principal Project Company shall provide and maintain temporary lighting whenever new permanent lighting fixtures are switched over from existing lighting.

#### 1.5 TELEPHONE SERVICE

- A. Principal Project Company shall provide, maintain and pay for telephone service to Principal Project Company's field office from the time of project mobilization.

## 1.6 TEMPORARY WATER SERVICE

- A. Potable Water: Principal Project Company shall arrange with the San Francisco Water Department to provide potable water by connecting to City water systems.
1. Contact the Water Department at 415-923-2400 for arranging such water service.
  2. Water is available from fire hydrants located in the streets. Obtain permission from the San Francisco Fire Department to use hydrants.
  3. Pay the costs of connection fees, meters, and all water furnished by the San Francisco Water Department under the water service account established above.
- B. Principal Project Company is advised that Ordinance # 175-91, Article 21, Section 1100 to 1107 of the San Francisco Municipal Code (Public Works Code), restricts the use of potable water for soil compaction or dust control activities, to the extent not directly in conflict with any applicable federal, state and local law.
1. In consideration for potential health concerns, an exemption may be allowed for the use of potable water for soil compaction or dust control activities when human contact and exposure exists. Such exemption will be considered and may be granted on a case by case basis.
  2. If Principal Project Company seeks to use potable water for soil compaction or dust control activities, Principal Project Company, shall apply for, and obtain an exemption pursuant to Ordinance #175-91, Article 21, prior to its use. The application for such use of potable water is to be sent to the Department of Public Health, Environmental Health Section, 1390 Market St., Room 910, San Francisco, CA 94102, Telephone 415-252-3945. Permission for such use may be granted by the General Manager of the Water Department, pursuant to Ordinance #175-91, Article 21.
- C. Reclaimed Water: Principal Project Company shall arrange with the SEWPCP to provide reclaimed water for soil compaction and dust control which is available at no cost to Principal Project Company at the SEWPCP from 8:00 A.M. to 5:00 P.M. on weekdays and Saturdays.
1. Arrangements can be made for access to reclaimed water at other times.
  2. A permit is required to obtain reclaimed water from the City. Contact [mfisher@sfgwater.org](mailto:mfisher@sfgwater.org) and/or (415) 695-7378 at least three (3) days prior to the date that reclaimed water is required. See <http://sfgwater.org/modules/showdocument.aspx?documentid=7234> for more information.
- D. Principal Project Company shall provide its own water tanker and hoses. Principal Project Company's hoses crossing traveled roadways shall be buried beneath the roadway or ramped over.
- E. Principal Project Company shall provide and maintain distribution piping, water tankers, hoses, and all appurtenances necessary to supply water at the job site.
1. Bury pipe crossing traveled roadways beneath the roadway. Use hose or ramp over temporary piping on roadway surfaces.

## 1.7 TEMPORARY SANITARY FACILITIES

- A. Principal Project Company shall provide and maintain required toilet facilities and enclosures. Location of facilities shall be a minimum of 50 feet away from the Project field office or otherwise approved by City.

- B. Principal Project Company shall be responsible to provide and maintain all construction facilities, temporary controls, and temporary utilities as required to perform the work of the Contract Documents. Principal Project Company shall arrange with the utility agencies to provide and pay for such utility services required, including furnishing, installing and removing on completion of all work all temporary connections to said utilities.
- C. Principal Project Company shall provide and maintain temporary toilet facilities and enclosures as required at no cost to the City.

## **1.8 TEMPORARY CONSTRUCTION FENCE**

- A. Principal Project Company shall furnish and install a temporary 6'-0" chain link construction fence with lockable gates at the limit of work and at areas to isolate and protect the public from hazardous conditions during construction.
- B. Principal Project Company shall provide fencing as needed to prevent unsafe entry to construction areas and to protect existing facilities and adjacent properties from damage from construction operations.
- C. Protect vehicular traffic, stored materials, site and structures from damage. **TEMPORARY ENCLOSURES**
- A. Principal Project Company shall provide temporary enclosure for protection of construction in progress and completed, from exposure, foul weather, other construction operations and similar activities.
  1. Where heat is needed and the permanent building enclosure is not complete, provide temporary enclosures where there is no other provision for containment of heat. Coordinate enclosure with ventilating and material drying or curing requirements to avoid dangerous conditions and effects.
  2. Install tarpaulins securely, with incombustible wood framing and other materials. Close openings of 25 square feet or less with plywood or similar materials.
  3. Close openings through floor or roof decks and horizontal surfaces with load-bearing wood-framed construction.

## **1.10 MAINTENANCE OF THE WORK AREA**

- A. Principal Project Company shall maintain the work areas in a safe condition, remove all accumulations of rubbish (Principal Project Company's waste and public refuse) and surplus materials at the end of each working day, restore them to a condition equal to that which existed prior to the start of work, and leave them at completion of the contract in a clean, orderly fashion.
- B. Demolished concrete, deteriorated masonry, cleared vegetation, and excavated material not indicated for reuse shall be removed from the site at the end of each working day without delay and disposed of in a legal manner.
- C. Cleaning During Construction: Control accumulation of waste materials and rubbish; collect waste from construction areas and elsewhere daily. Comply with requirements of NFPA 241 for removal of combustible waste material and debris. Enforce requirements strictly.
  1. Clean interior spaces prior to the start of finish work; maintain areas free of dust and other contaminants during finishing operations.
  2. Handle hazardous, dangerous, or unsanitary waste materials separately from other waste by containerizing properly. Dispose of material off-site in a lawful manner.

3. Maintain the site and all adjacent public areas in a clean and orderly condition. Maintain the site, equipment, fences and signs free of graffiti. Remove all graffiti daily using methods which cause no damage to the work or existing facilities.
4. Sweep all pedestrian walkways and dispose of debris around the site perimeter on a daily basis.

#### **1.11 DRAINAGE CONTROL**

- A. Grade site to drain. Maintain excavations free of standing water.
- B. Provide, operate, and maintain pumping equipment as needed to control water at the site.
- C. Protect site from erosion caused by flowing water.

#### **1.12 CONFINED SPACE ENTRY**

- A. It is the responsibility of Principal Project Company to provide all equipment or assistance to make the confined space safe for entry by the City or its representative per the California Administration Code, Title 8, and General Industry Safety Orders Entitled "Confined Spaces".

#### **1.13 TEMPORARY PROJECT SIGN**

- A. Project sign image and layout shall conform to the graphical layout and color approved by the City.
- B. Principal Project Company shall obtain the City's approval of the proposed locations, height, and mounting details for each project sign. The project signs may be mounted on construction fence, face of wall, or on posts.
- C. ONESF Project Sign Fabrication:
  1. Size: Project sign shall be 4-feet by 6-feet.
  2. Digital File: Project sign shall match the final graphical layout provided by the City, including the colors and fonts. For more information, refer to the latest Sign Guidelines available from the following website: <http://onesanfrancisco.org/> (Click on "Data + Resources > Signage and Style Guide")
    - a. The design of Principal Project Company furnished project signs shall be in strict accordance with the 'ONESF' Guidelines established by the City.
  3. Mounting Material: Project sign shall be mounted on Medium Density Overlay board (MDO), at least 3/4-inch thick.
  4. Printing: Project sign shall be printed on a 4-color CMYK printer.
  5. Coating: Use UV and Anti-Graffiti coatings.
  6. Quality: Project sign shall last the entire construction duration.
- D. Principal Project Company shall submit a mock-up of the Project sign in color, on bond paper, 11x17 size, to the City for approval prior to fabrication.
- E. Principal Project Company shall install the required project sign(s) shall maintain project sign(s) in good condition for the duration of the contract.

- F. After Substantial Completion, Principal Project Company shall remove each Project sign from the site as its property, and restore area per plans or as directed by the City at no additional cost to the City.
- G. Damaged Project sign that cannot be repaired on site shall be replaced at no additional cost to the City.

#### 1.14 TEMPORARY TOW AWAY/NO-PARKING SIGNAGE

- A. On January 1, 2017, temporary occupancy permits and all other permits that include tow-away signage, aside from excavation permits activated through 311, will not be activated and permittees will not have tow away rights unless and until time and date stamped photos evidencing that signage was posted in the correct location a minimum of 72 hours prior to the time at which the parking restrictions shall become effective under the permit have been uploaded to the San Francisco Public Works, Bureau of Street Use and Mapping (SFPW/BSM) Tow-Away Sign Database. See Appendix B – Tow-Away Sign Activation and Photo Upload Process.
- B. Principal Project Company is advised that Sign Ordinance PWC Article 15, Section 724 which will require the applicant (Principal Project Company) to input the amount of right of way they will occupy during construction activities for a specific permit, to be issued by SFPW/BSM for all work in the Public Right-of-Way. Principal Project Company shall enter times of operation during construction with the proposed start and end times and specific calendar days. This information will be printed on the tow-away signs. Refer to Tow Away Manual at <http://www.sfpublishworks.org/sites/default/files/4506-Tow-Away%20User%20Guide.pdf>.
  1. The location of the Construction Zone will be entered as part of the excavation permit, which will include the length of occupancy (distance in linear feet). This information and date. Once a permit has been approved, the applicant is informed off the approval via email and will be provided a hyperlink to create/modify the tow/away signs prior to printing.
  2. The information required at time of permit will update the database and will validate that the total linear footage of construction occupancy does not exceed 1,200 linear feet. Upon completion of any adjustment to the tow-away signs, the applicant can determine which street segment to print out and may choose to either print one of two general tow-away sign template or request the Department of Public Works to print the tow-away signs. Principal Project Company shall pay for the printing of each sign.
  3. Size: Tow-Away/No-Parking Signs shall be 11' wide x 17' tall.
  4. Digital File: Project sign shall match the final graphical layout provided by the City, including the colors and fonts. The design of Principal Project Company furnished project signs shall be in strict accordance with the DPW Order for Towaway Signs located at: <http://sfpublishworks.org/sites/default/files/4508-TowAway-2015-Template.pdf>.
  5. Principal Project Company shall use only paper types which shall be waterproof durable; tear resistant' with laser paper labels type and templates: 11 x 17 10 PT CV, 215 grams/m<sub>2</sub>
  6. Printing: Project sign can be printed on a Xerox Phaser 7800, or equivalent that can print 11x17 120-130 lb paper. All Tow-Away/No-Parking Signs shall be secured and paid for by Principal Project Company.
  7. Principal Project Company shall maintain Tow-Away/No-Parking Sign (s) in good condition as needed throughout the duration of the Contract.

8. After substantial completion, Principal Project Company shall remove each Tow-Away/No-Parking Sign from the site as its property.
9. Damaged Tow-Away/No-Parking Sign that cannot be repaired on site shall be replaced at no additional cost to the City.

#### **1.15 REMOVAL OF UTILITIES, FACILITIES, AND CONTROLS**

- A. Principal Project Company shall:
  1. Remove temporary above grade or buried utilities, construction equipment, temporary structures and facilities, unused materials, rubbish and debris prior to Final Inspection. Restore facilities to conditions prior to construction, to the satisfaction of the City.
  2. Clean and repair damage caused by installation or use of temporary work.
  3. Restore existing facilities used during construction to original condition. Restore permanent facilities used during construction to specified condition.
  4. Remove field offices and temporary utility services from the Site.

#### **1.16 STORAGE AND STOCKPILING**

- A. Principal Project Company shall make its own arrangements for off-site storage or shop areas and off-site construction parking facilities. On-site storage shall be limited to materials and equipment currently being installed or utilized.
- B. If necessary, Principal Project Company shall arrange for temporary off-site storage of equipment and materials at its discretion. No additional compensation shall be provided from the City.

#### **PART 2 - PRODUCTS (NOT USED)**

#### **PART 3 - EXECUTION (NOT USED)**

APPENDIX A (01 50 00): TOW-AWAY SIGN ACTIVATION AND PHOTO UPLOAD PROCESS

## Tow-Away Sign Activation and Photo Upload Process

[www.sfpublishworks.org](http://www.sfpublishworks.org)

**San Francisco Public Works**

1155 Market Street, 3rd Floor  
San Francisco CA, 94103  
Phone: (415) 554-5810  
Fax: (415) 554-6161

Processing Hours: 7:30 AM - 4:00 PM  
Monday through Friday, except official holidays

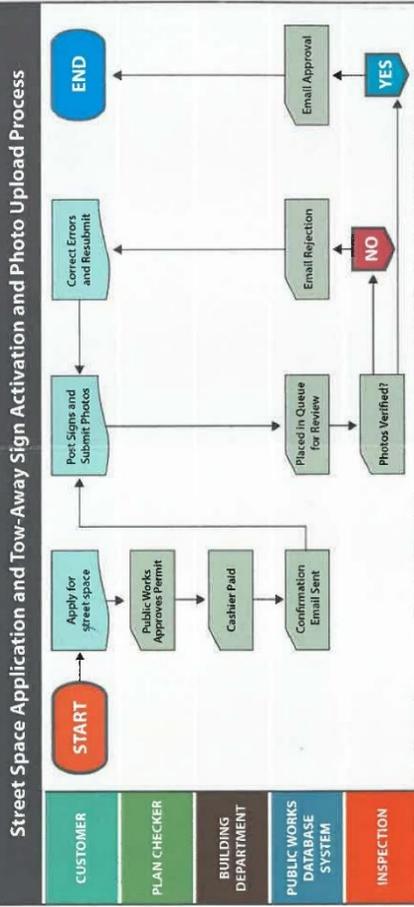

Contact 311 for complaints

Beginning on January 1, 2017, temporary occupancy permits and all other permits that include tow-away signage, aside from excavation permits activated through 311, will not be activated and permittees will not have tow-away rights unless and until time and date stamped photos evidencing that signage was posted in the correct location a minimum of 72-hours prior to the time at which the parking restrictions are to become effective under the permit have been uploaded to the Bureau of Street-Use and Mapping Tow-Away Sign Database.

Printed on 100% post-consumer recycled stock

# Public Works Tow-Away Sign Activation and Photo Upload Process

EFFECTIVE DATE: January 1, 2017

**PERMITS AFFECTED:**  
 The tow-away sign activation and photo upload process change is applicable to all temporary occupancy permits and all other permits that include tow-away signage. **Excavation permits activated through 311 will not be impacted.**

**ACTIVATION AND PHOTO UPLOAD PROCESS:**  
**STEP 1:** Request a street space permit from Public Works.  
**STEP 2:** Once permit is approved a link for tow-away signs will be provided via email along with a link to the Bureau of Street-Use and Mapping tow-away sign database.

**STEP 3:** Print signs and post them at the permitted location every 20 feet no less than 72 hours in advance of the time the parking restrictions are to become effective.  
**STEP 4:** Click on the link provided in the confirmation email and take photos showing the placement of the signs.

**STEP 5:** Click submit and the photos will be submitted to Bureau of Street-Use and Mapping for review.

**STEP 6:** A confirmation email will be sent stating the photos were accepted, the permit is active, and tow-away rights are reserved.

**NOTE:** If photos are inadequate, you will receive a rejection email identifying the deficiencies to be corrected.

## PHOTO REQUIREMENT 1:

A scene-setting photo clearly showing the signs are posted in the permitted location every 20 feet.

## PHOTO REQUIREMENT 2:

A close-up photo of a tow-away sign that enables essential information on the sign to be confirmed.

END OF SECTION

## **SECTION 01 57 26 - TEMPORARY PROTECTION OF CATCH BASINS AND STORM DRAIN INLETS**

### **PART 1 - GENERAL**

#### **1.1 DESCRIPTION**

- A. Documenting and protecting catch basins and storm drain inlets as incidental work.

#### **1.2 RELATED SECTIONS**

- A. 01 71 33 - Protection of Adjacent Construction

### **PART 2 - PRODUCTS**

#### **2.1 MATERIALS**

- A. Principal Project Company shall provide all labor and materials necessary to protect debris from entering the sewer system.

### **PART 3 - EXECUTION**

#### **3.1 PREPARATION**

- A. Principal Project Company shall photograph all catch basins within the limits of work. Each catch basin shall have at least two photos, one from the top view and one from the side view along the flow line. Refer to Section 01 71 33-1.6B.
- B. Principal Project Company shall notify the City of any clogged catch basin or storm water inlet immediately upon discovery.
  - 1. Call SFPUC Sewer Operations at 415-695-2096 to report catch basins or storm water inlets containing debris in the barrels and/or cast iron traps.

#### **3.2 DRAINAGE PROTECTION**

- A. Principal Project Company shall be responsible for protecting and keeping in operation all storm water inlets and catch basins throughout the entire Project Site for the duration of the Project until Final Acceptance.
- B. Principal Project Company shall take adequate measures to prevent the impairment of the operation of the sewer system. Principal Project Company shall prevent construction material, pavement, concrete, earth, paints, thinner, solvents, and other debris or toxic material from entering a sewer or sewer structure including surface flow collection system, such as catch basins and culverts.
- C. Prior to the final inspection and acceptance, Principal Project Company shall check all storm water inlets and catch basins within the project limits for debris.

**END OF SECTION**

## SECTION 01 71 33 - PROTECTION OF EXISTING FACILITIES AND ADJACENT CONSTRUCTION

### PART 1 - GENERAL

#### 1.1 SECTION INCLUDES

- A. Section includes requirements for protection of existing facilities and improvements.

#### 1.2 RELATED SECTIONS

- A. Section 01 50 00 –Temporary Facilities and Controls

#### 1.3 EXISTING UTILITIES AND IMPROVEMENTS

- A. Principal Project Company shall:
  - 1. Notify Underground Service Alert (USA) prior to excavating in the public right of way areas so that Utility Owners may be advised of the work and may field mark or otherwise protect and warn Principal Project Company of their existing utility lines. Contact USA, telephone 1-800-227-2600, or refer to USA website for more information at: <http://www.usanorth.org/>.
    - a. Provide reasonable access and do not hinder or otherwise interfere with any company or agency having underground facilities in removing, relocating, or protecting such facilities.
  - 2. Verify the actual locations and depths of all utilities indicated or field marked. Make a sufficient number of exploratory excavations at Principal Project Company's expense of all utilities that may interfere with the work sufficiently in advance of construction to avoid possible delays to Principal Project Company's work.
    - a. Notify the City if such exploratory excavations show the utility location as shown or as marked to be in error.
    - b. When utility lines are encountered within the area of Principal Project Company's operations, notify the City and the Utility Owners sufficiently in advance for the necessary protection measures to be taken to prevent interruption of service or delay to Principal Project Company's operations.
- B. Principal Project Company shall protect all existing utilities, facilities, and structures, public or private, and will be held responsible for all damage caused by Principal Project Company not exercising due care to avoid such damage.
- C. Overhead Contact System: Work on or under the overhead contact system shall be performed with lines and feeders energized unless shutdown of the system is granted. Notify the SFMTA at least 10 days prior to performing work on energized overhead trolley wires, feeder circuits, or at substations, so that the SFMTA may arrange for any necessary clearances and inspections.
  - 1. Principal Project Company is alerted to the condition that overhead trolley wires and feeder cables distribute electrical energy at up to 700 Volts dc. Comply with the "High Voltage" provisions of the California Code of Regulations (Title 8, Division 1, Chapter 4, and Subchapter 5).
  - 2. Take precautions to avoid accidents and damage to the overhead contact wires, and riser and feeder cables.

- D. Survey Monuments and Bench Marks: Principal Project Company shall bring to the attention of the City all survey monuments, bench marks, property line marks and the like, encountered on the work. Survey monuments, bench marks, or other survey marks or points shall not be removed or disturbed until referenced or relocated by the City or other agency or party having an interest therein, and then removed only at the time and in the manner specifically approved by the City. Principal Project Company shall bring all City monument frames within the limits of the work to grade, with the express provision that any and all work associated with the removal and relocation of such frames, with their covers, shall be under the direct supervision of the City, and all such work shall be considered incidental work. The cost of re-establishing and resetting survey monuments, bench marks or other survey marks or points lost or destroyed through the carelessness or negligence of, or inadvertently by, Principal Project Company shall be at the sole expense of Principal Project Company.

#### **1.4 SAFEGUARDING OF EXISTING FACILITIES**

- A. Principal Project Company shall perform all work, including dewatering operations, in such a manner as to avoid damage to existing fire hydrants, power poles, lighting standards, and all other existing utilities, facilities, trees and vegetation, and structures. Principal Project Company shall be responsible for any damage due to its failure to exercise due care.
- B. Broken concrete, debris, etc., shall be immediately removed from the Project Site as Principal Project Company's property and shall be disposed of in a legal manner.
- C. Principal Project Company shall take adequate measures to prevent the impairment of the sewer system and to prevent construction material, pavement concrete, earth or other debris from entering a sewer, sewer structures, catch basin, or storm water inlet. Principal Project Company shall restore damaged utilities and facilities to a condition equal to or better than they were prior to such damage.

#### **1.5 RESTORATION OF PAVEMENT**

- A. General: All paved areas cut or damaged during construction shall be replaced with similar materials and of equal thickness to match the existing undisturbed areas, except where specific resurfacing requirements are called for in the Contract Documents or in the permit requirements of the Governmental Entity issuing the permit. All pavements which are subject to partial removal shall be neatly saw cut in straight lines.
- B. Conserving Distinctive Sidewalk Elements: For work located within landmark and/or conservation historic districts, all distinctive sidewalk elements such as brick surfacing, brick gutters, granite curbs, cobblestones, non-standard sidewalk scoring and streetscape elements that appear to be 45 years or older will be treated as potentially character defining features of their respective historic districts.
1. Principal Project Company shall avoid damaging and protect in place any features described above and shall notify the City of any feature not identified on the plans that is in conflict with the proposed work.
  2. Granite curb shall only be replaced with concrete curb on curved sections and as part of the curb ramp construction.
- C. Temporary Resurfacing: Whenever required by the Authorities Having Jurisdiction, place temporary surfacing promptly after backfilling and maintain such surfacing in a satisfactory condition for the period of time before proceeding with the final restoration.
- D. Permanent Resurfacing: Damaged edges of pavement along excavations and elsewhere shall be trimmed back by saw cutting in neat straight lines. All pavement restoration shall be constructed to finished grades compatible with undisturbed adjacent pavement.

- E. Restoration of Sidewalks or Driveways: Wherever sidewalks, curbs and gutters, or driveways have been removed for construction purposes, place suitable temporary sidewalks, curbs and gutters, or driveways promptly after backfilling and maintain them in satisfactory condition for the period of time before the final restoration is made.

#### **1.6 JOINT SURVEY TO ESTABLISH AUTHENTICITY OF POSSIBLE CLAIMS**

- A. Principal Project Company shall use such methods and shall take adequate precautions to prevent damage to existing buildings, structures, and other improvements during the prosecution of the work.
- B. Principal Project Company shall retain an experienced photographer to perform preconstruction examination and, if necessary, post-construction survey of all nearby structures, including photographs of all catch basins within the limit of work and nearby intersections. Each catch basin shall have at least two photos, one from the top view, and one from the side view along the gutter line. The survey shall be made using digital still photographs or digital videos saved to compact discs. The survey shall be considered incidental work and no separate payment will be made therefor.
- C. Prior to the commencement of Construction Work, the Principal Project Company shall arrange for a joint examination with the City of existing buildings, structures and other improvements in the vicinity of the Project Site, as applicable, which might be damaged by Principal Project Company's Construction Work.
- D. The examination of the exterior of existing buildings, structures, and other improvements located within 25 feet of the construction excavation will be made jointly by authorized representatives of Principal Project Company, the City, and property owners. The scope of each examination shall include, but is not limited to, recording of cracks in structures, settlement, leakage and the like.
- E. Records in duplicate of all observations shall be prepared and delivered by the photographer to the City and to Principal Project Company. The photographer may be required to attest to the fact that they took the pictures; however, in no case, will they determine the cause cracks, settlement, leakage, or like condition nor is photographer being retained for the purpose of engineering evaluation.
- F. The above records and photographs are intended for use as indisputable evidence in ascertaining the extent of any damage which may occur as a result of Principal Project Company's operations and are for the protection of the adjacent property owners, Principal Project Company, and the City, and will be a means of determining whether and to what extent damage, resulting from Principal Project Company operations, occurred during the Construction Work.

#### **PART 2 - PRODUCTS (NOT USED)**

#### **PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## SECTION 01 74 50 - MATERIAL REDUCTION AND RECOVERY PLAN

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. This section governs the recovery of construction and demolition debris.
- B. Principal Project Company is responsible for complying with all aspects of this Section.
- C. On October 16, 2006, the San Francisco Mayor issued Executive Directive 06-05 requiring all construction contracts to divert 75% of construction and demolition debris from landfill disposal sites. This directive is supported by existing policies that require reuse, recycling, and management of construction and demolition debris. Some of these policies are described below.
- D. The City and County of San Francisco adopted an ordinance (No. 27-06) that creates a mandatory program to maximize the recovery of all construction and demolition debris.
  - 1. The Ordinance requires that mixed construction and demolition debris material be transported off-site by a Registered Transporter and taken to a Registered Facility.
  - 2. Material source separated at the job site shall be taken to a facility that reuses or recycles such material.
  - 3. This ordinance applies to all construction projects within the City and County of San Francisco, such as new construction, remodels, tenant improvements, additions, repairs, and full and partial demolitions.
  - 4. This ordinance prohibits any construction and demolition debris from being placed in trash or sent directly to a landfill.
- E. Principal Project Company shall perform all work and meet all requirements in this Section at no additional cost to the City.
- F. Related Requirements:
  - 1. Section 01 50 00 -Temporary Facilities and Controls
  - 2. Section 01 77 00 - Closeout Procedures

### 1.3 DEFINITIONS

- A. Alternative Daily Cover (ADC): Materials, other than soil, that have been approved by the California Department of Resources Recycling and Recovery ("CalRecycle") or a successor agency for use as a temporary overlay on an exposed landfill face.
- B. Beneficial Reuse: The reuse of material at a landfill that does not include ADC but does include use of materials for the following purposes: alternative intermediate cover; final cover foundation layer; liner operations layer; leachate and landfill gas collection system; construction fill; road base; wet weather operations pads and access roads; and, soil amendments for erosion control and landscaping. "Beneficial reuse" shall not include disposal of material at a landfill.
- C. City-owned Facility: Any building owned by the City and County of San Francisco. "City-owned Facility" includes City-owned facilities or portions thereof that the City leases to non-City entities.
- D. City Leasehold: A building or portion thereof owned by others where the City and County of San Francisco is a tenant.
- E. City's Waste Tracking Platform: An on-line waste tracking platform hosted by Green Halo Systems that can be found at <https://wastetracking.com/city/sfgov/> .
- F. Compostable: Any material that can be broken down into, or otherwise become part of, usable compost (e.g., soil-conditioning material) in a safe and timely manner as accepted in San Francisco's compostables collection program, such as food scraps, soiled paper and plant trimmings.
- G. Construction and Demolition Debris or C&D Debris: Building materials and solid waste generated from construction and demolition activities including, but not limited to, fully cured asphalt, concrete, brick, rock, soil, lumber, gypsum wallboard, cardboard and other associated packaging, roofing material, ceramic tile, carpeting, fixtures, plastic pipe, metals, tree stumps, and other vegetative matter resulting from land clearing and landscaping for construction,

deconstruction, demolition or land developments. This term does not include refuse regulated under the 1932 Refuse Collection and Disposal Initiative Ordinance or sections of the Municipal Code that implement the provisions of that ordinance or materials from the public right-of-way. Hazardous material, as defined in California Health and Safety Code section 25100, et seq., as amended, is not construction and demolition debris.

- H. Disposal: The final deposition of material at a legally operating permitted landfill that does not include beneficial reuse or at a permitted transformation facility. A legally operating, permitted landfill includes Class III landfills and inert fills. Disposal of inert materials at inert fills or inert backfill sites does not constitute recycling.
- I. Diversion: Use of material for any purpose other than disposal in a landfill or transformation facility, such as source reduction, reuse, recycling, and composting activities that do not result in material being disposed at permitted landfills and transformation facilities.
- J. Landfill: A facility that (i) accepts for disposal in or on land non-hazardous material such as household, commercial, and industrial waste, and waste generated during construction, remodeling, repair and demolition operations, and (ii) has a valid current solid waste facilities permit from the California Department of Resources Recycling and Recovery (CalRecycle).
- K. Mixed Construction and Demolition Debris Material or Mixed C&D Debris Material: Construction and demolition (C&D) debris or C&D debris that are combined on the project site and hauled away for sorting.
- L. Recover or Recovery: Any activity, including source reduction, deconstruction and salvaging, reuse, recycling, composting, or anaerobic digestion which causes materials to be recovered for use as a resource and diverted from disposal. Recovery shall not include engineered municipal solid waste conversion.
- M. Recyclable Material: Any material or product that can be sorted and reconstituted, for the purpose of using the altered form in the manufacture of a new product, as accepted in San Francisco's recycling collection program, such as paper, bottles and cans. Recycling does not include burning, incinerating, converting, or otherwise thermally destroying solid waste.
- N. Recycling: The process of collecting, sorting, cleansing, treating, and reconstituting materials that would otherwise become solid waste, and returning them to the economic mainstream in the form of raw material for new, reused, or reconstituted products which meet the quality standards necessary to be used in the marketplace. Recycling does not include burning, incinerating, or thermally destroying solid waste, nor shall it include disposal.
- O. Recycling Facility: An operation or person that collects and processes materials for recycling.
- P. Registered Transporter: Anyone who is hired to remove Mixed Construction and Demolition Debris Material from a construction and/or demolition site in San Francisco, using a vehicle with more than two axles or two tires per axle (such as a large pickup truck with four tires on the rear axle or three-axle dump trucks) and is hauling at least one (1) cubic yard of Mixed Construction and Demolition Debris Material and holds a valid registration from the City and County of San Francisco pursuant to Chapter 14 of the Environment Code. A Registered Transporter is obligated to take all mixed material only to a Registered Facility.
- Q. Registered Facility: Any facility that accepts Mixed Construction and Demolition Debris Material for processing and recycling and holds a valid registration issued by the City and County of San Francisco pursuant to Chapter 14 of the Environment Code.
- R. Reuse: Using an object or material again either for its original purpose or for a similar purpose without significantly altering the physical form of the object or material.

- S. Source Reduction: Any action which causes a net reduction in the generation of solid waste. Source reduction includes, but is not limited to, reducing the use of non-recyclable materials, replacing disposable materials and products with reusable materials and products, reducing packaging, reducing the amount of yard wastes generated, establishing garbage rate structures with incentives to reduce waste tonnage generated, and increasing the efficiency of the use of paper, cardboard, glass, metal, plastic, and other materials.
- T. Source Separated Materials: Materials that have been separated or kept separate from the solid waste stream, at the point of generation, for the purpose of reuse, recycling or composting in order to return them to the economic mainstream in the form of raw material for new, reused, or reconstituted products which meet the quality standards necessary to be used in the marketplace.
- U. Solid Waste: Materials designated as non-recyclable and discarded for the purposes of disposal.
- V. Universal Waste (CCR Title 22, Division 4.5, Chapter 23): Certain specified hazardous materials that are more common and pose a lower risk to people and the environment than other hazardous materials. Universal wastes are handled with reduced management requirements. Examples of universal waste: batteries, fluorescent tubes (lamps), electronic devices (cell phones, computers, televisions), cathode ray tubes (CRTs), mercury wastes (thermometers and toys), and non-empty aerosol cans.
- W. Treated Wood Waste (CCR Title 22, Division 4.5, Chapter 34): Dimensional lumber and other wood products which have been removed from service and were treated with preserving chemicals that protect the wood from insect attack and fungal decay during its use. Examples include fence posts, sill plates, landscape timbers, pilings, railroad ties, guardrails, and decking. Treated Wood Waste is a hazardous material in California and must be managed according to specific regulations.
- X. Waste Diversion: a management activity that disposes of waste through methods other than incineration or landfilling. Examples include reuse and recycling.

#### **1.4 GENERAL REQUIREMENTS**

- A. Recovery Goal: In order to meet the City's zero waste goal, the goal for this Project is to recover no less than 75% of the construction and demolition debris material from landfill disposal through waste prevention, reuse, and recycling. If a construction site contains Hazardous Materials and/or Universal Wastes, the 75% minimum recovery requirement shall pertain to all non-Hazardous Material. No construction and demolition debris material shall be disposed in garbage or taken directly to landfill.
- B. In order for construction and/or demolition debris to be considered hazardous, such as containing asbestos or lead, it shall be evaluated and determined to be hazardous by an independent professional such as a Cal/OSHA or DOSH Certified Asbestos Consultant. The waste determination and other verification shall be included with the C&D Debris Management Plan (refer to Paragraph 1.5 below), together with a list of hazardous materials found at the project site and plans for proper disposal.
- C. All Hazardous Materials, including Universal Wastes and Treated Wood Waste, shall be documented separately, and a summary of all manifests or other disposal documentation, including material description and weights, shall be provided to the City.
- D. Highest and Best Use: Principal Project Company shall employ the following hierarchy of highest and best use for handling construction and demolition debris as follows:
  1. Implement reduced material usage or reuse of materials before any recycling;

2. Implement recycling or reuse of source separated material before any recycling of mixed construction and demolition debris material;
3. Implement recycling of mixed construction and demolition debris material before all other forms of disposal.

E. Recycling Requirements:

1. Source Separated Materials: Principal Project Company shall develop and implement procedures for source-separation, to the greatest extent feasible, of the following types of recyclable or reusable materials:
  - a. Asphalt.
  - b. Acoustical ceiling tiles.
  - c. Bricks, stone(s), granite, and other finished stone-type materials.
  - d. Carpet and padding.
  - e. Concrete, concrete block, slump stone (decorative concrete block).
  - f. Corrugated cardboard.
  - g. Dimensional lumber and beams.
  - h. Fixtures, hardware, doors, and windows.
  - i. Metal, ferrous and non-ferrous.
  - j. Mixed Inerts.
  - k. Rigid plastic.
  - l. Soil/dirt/rock.
  - m. Trees, Landscape Debris, cleared vegetation and cut-off or other wood scraps.
  - n. Wall board, gypsum sheetrock.
2. Mixed Construction & Demolition Debris Material:
  - a. For projects within the legal and geographical boundaries of the City and County of San Francisco, mixed C&D debris material must be taken to a Registered Facility by a Registered Transporter, per Environment Code 14. Registered Facilities Recovery (Diversion) Rates are listed at: <https://sfenvironment.org/construction-demolition-resources>
  - b. For projects outside San Francisco, if mixed C&D debris material is taken to a non-Registered Facility the diversion rate approved by the local jurisdiction shall be used, and official documentation of the diversion rate approved by the local jurisdiction must be provided by Principal Project Company. If a facility does not have a locally approved recovery/recycling rate, the recovery (diversion) rate is calculated as zero.

3. Handling of Recyclable Materials:
    - a. Principal Project Company shall assure that recyclable or reusable materials be free of dirt, adhesives, solvents, petroleum contamination, and other substances deleterious to the recycling process. Principal Project Company shall clean materials that are contaminated before placing it in collection containers.
    - b. Principal Project Company shall arrange for collection of reusable and recyclable materials by delivery to the appropriate reuse and/or recycling centers for purposes of reuse and/or recycling.
    - c. All mixed C&D debris material from projects in San Francisco must be taken to a Registered Facility authorized to process the material, and it must be hauled by a Registered Transporter. For the lists of Registered Facilities and Registered Transporters refer to the website: <https://sfenvironment.org/construction-demolition-resources>
  4. No construction and demolition debris shall be burned, buried or otherwise disposed of on the project site.
- F. Principal Project Company is prohibited from sending any construction and demolition debris directly to landfill or to any facility that would incinerate or otherwise process such debris using high temperature technology without submitting a written request to and receiving approval from the San Francisco Department of the Environment; see Form A and Form B.
- G. Requirements only for construction contracts within the legal and geographical boundaries of the City and County of San Francisco:
1. Registered Transporters and Registered Facilities: Only Registered Transporters can remove mixed C&D debris material and they must take this material to a Registered Facility. Source separated material at the job site shall be taken to the appropriate recycling or reuse facility.
    - a. For a list of Registered Facilities and Registered Transporters refer to the website: <https://sfenvironment.org/construction-demolition-resources>
  2. Full Demolition Requirements: Principal Project Company conducting full demolition of an existing structure must submit a Demolition Debris Recovery Plan (DDRP) to the San Francisco Environment Department (SFED).
    - a. The DDRP must demonstrate a minimum of 75% recovery from landfill of demolition debris, including materials source separated for reuse or recycling.
    - b. The DDRP must be submitted to and approved by SFED before the Department of Building Inspection will issue a Full Demolition Permit.
    - c. This requirement does not apply to City construction contracts outside of the legal and geographical boundaries of the City and County of San Francisco.
    - d. The DDRP is available at the following website: <https://sfenvironment.org/construction-demolition-resources>
- H. Mixed C&D debris material from projects outside the legal and geographical boundaries of the City and County of San Francisco must be taken to a Recycling Facility that processes the material to achieve maximum recycling. If the material is taken to a facility not registered with San Francisco, the local jurisdiction's recycling rate for that facility shall be used provided official documentation from the local jurisdiction is attached to all submittals as required in Paragraphs

1.5, 1.6 and 1.7 below. If a facility does not have a local approved recycling rate, the diversion rate is calculated as zero.

I. Universal Wastes: Principal Project Company shall handle and dispose of all hazardous material, including Universal Waste in accordance with the requirements of the California Department of Toxic Substances Control (DTSC). Refer to DTSC website: [www.dtsc.ca.gov](http://www.dtsc.ca.gov). In general, Universal Waste may not be discarded in solid waste landfills or with non-Hazardous Materials collected for recycling or composting. Principal Project Company shall comply with all Hazardous Material regulations, including, but not limited to, the following:

1. Universal Wastes shall be stored in containers so that they do not spill, leak, break, or are released into the environment.
2. Label or mark universal wastes, or their containers, to identify their types.
3. Send all universal waste to a facility authorized to collect, recycle or dispose of universal waste.
4. Do not dispose of universal waste in the trash.
5. Do not accumulate more than 5,000 kilograms of Universal Waste at any one time.
6. Train employees in proper Universal Waste management including handling, packaging, storing and labeling the Universal Waste, as well as how to respond to releases. This training may be accomplished by simply giving employees written instructions about Universal Waste.
7. Keep record of all shipments and receipts of Universal Waste for three years.

J. Treated Wood Waste: For complete information on handling and disposal of Treated Wood Waste (TWW), refer to the fact sheet available from the DTSC website. For incidental TWW wastes generated during construction, Principal Project Company shall comply with the following minimum requirements:

1. Keep TWW segregated from other materials.
2. Store no more than 1,000 pounds of TWW for no longer than 30 days. In the event that Principal Project Company stores more than 1,000 pounds of TWW or stores TWW for more than 30 days, Principal Project Company shall comply with additional requirements for routine generators of TWW. Refer to DTSC fact sheet.
3. Label all TWW bundle/shipments with the following information:

<p style="text-align: center;"><b>TREATED WOOD WASTE – Do not burn or scavenge.</b></p> <p><b>TWW Handler</b> <b>Name:</b> _____ <b>Address:</b> _____ <b>Accumulation Date:</b> _____</p>
--

4. Take TWW to an authorized TWW facility. See the listings at the end of the factsheet for information on facilities who have been authorized to accept TWW in California.
5. Keep records of all shipments of TWW for three years.

- K. Waste Reduction: Principal Project Company shall implement waste reduction measures, including, but not limited to, the following:
1. Eliminating the procurement of unneeded supplies;
  2. Reduce waste by printing and copying double-sided;
  3. Submit all submittals, reports, and forms in electronic format (PDF);
  4. Fully participate in available and required recycling and composting programs; and
  5. Purchase products made with recycled content such as paper and recycled aggregate.

L. LEED:

1. Principal Project Company shall comply with the requirements of LEED version 4.0 MR Prerequisite Construction and Demolition Waste Management Planning.
2. The 75% minimum recovery requirement cannot include any alternate daily cover (ADC) in order to meet the requirements of LEED version 4.0 MR Credit Construction and Demolition Waste Management to earn the project 2 points.
3. Principal Project Company shall submit the following items in electronic format by uploading to the City's Waste Tracking Platform and in accordance with Paragraphs 1.5, 1.6, and 1.7 below:
  - a. Material Reduction and Recovery Plan.
  - b. Material Reduction and Recovery Monthly Summary of Recovery (Diversion) and supporting documentation.
  - c. Material Reduction and Recovery Final Report.

**1.5 MATERIAL REDUCTION AND RECOVERY PLAN**

- A. Principal Project Company shall comply with the requirements under this Paragraph 1.5 for the Project.
- B. Before commencement of the D&C Work at the Project Site, Principal Project Company shall prepare a Material Reduction and Recovery Plan (MRRP) to be discussed with the City. To prepare the MRRP, Principal Project Company shall conduct a site assessment to estimate the types and quantities of materials that will be generated by construction and/or demolition at the site and which materials are anticipated to be feasible and practical for reuse and recycling. .
- C. Principal Project Company shall schedule a meeting with the City to discuss its proposed MRRP to develop a mutual understanding regarding the City's reuse and recycling policies and goals and their application to the Project. Principal Project Company must manage all Construction Workg and demolition debris to meet a minimum recovery rate of 75%.
1. The MRRP will be used as a submittal for compliance with the waste management plan requirements of LEED version 4.0 MR Prerequisite Construction and Demolition Waste Management Planning. The MRRP shall include any and all required information to meet the LEED prerequisite.
- D. Principal Project Company shall obtain tonnage estimates for all construction and demolition debris from all Principal Project Companys and compile data from all Principal Project Companys into the MRRP. The MRRP shall include, but not be limited to, the following:

1. Principal Project Company's information and Project identification.
  2. Procedures to be used for debris management.
  3. A list of the materials and estimated quantities to be reused or recycled.
  4. The names, locations, and permit or license, as applicable, of recycling and reuse facilities and Registered Facilities (for mixed C&D debris material) that Principal Project Company plans to use for the Project.
  5. Procedures for source separation for the materials listed in subparagraph 1.4E "Recycling Requirements" of this Section.
  6. Source Reduction: Describe any project practices that will reduce waste at the source, such as requiring vendors to deliver materials in reusable packaging.
  7. On-site Processing: Describe procedures in which materials are reused on-site, such as grinding materials for use on-site, or reuse of lumber for concrete frames, etc.
  8. Procedures to educate and train all employees and Principal Project Companys on recycling and reuse procedures to be used at the jobsite.
- E. Principal Project Company shall use the City's Waste Tracking Platform to provide all MRRPs and related reports for the Project. The City will create a Green Halo project account for use by Principal Project Company. Principal Project Company shall then use this account to prepare and submit the initial MMRP following these steps:
1. Register the Project and create a project tracking number
  2. Provide the MRRP (<https://wastetracking.com/city/sfgov/>).
  3. Coordinate the MRRP with the LEED Construction and Demolition Debris Management Plan (if the Project is pursuing a LEED certification) requirements.
  4. Comply with the City and County of San Francisco's requirement for a minimum 75% recovery rate from landfill.
  5. Describe Principal Project Company's approach to managing the Project's construction and demolition debris.
  6. When complete, click "Submit" for review and approval.
- F. The MRRP is subject to approval by the City. Principal Project Company shall revise and resubmit the MRRP as required by the City.
- G. Review of Principal Project Company's MRRP shall not relieve Principal Project Company of responsibility for compliance with applicable laws and regulations governing control and disposal of solid waste or other pollutants.

## **1.6 MONTHLY UPDATES OF MATERIAL RECOVERY**

- A. Principal Project Company shall provide monthly updates through the City's Waste Tracking Platform by uploading new information, quantifying the construction and demolition debris generated and reused, or recycled. Principal Project Company shall upload information regarding transporter method, recovered materials, facilities used, and weight tickets generated as well as any other applicable supporting files and additional requirements.

## **1.7 MATERIAL REDUCTION AND RECOVERY FINAL REPORT**

- A. Upon Final Acceptance of the Project, Principal Project Company shall submit a Final Recovery Report to the City's Waste Tracking Platform showing weight of all construction and demolition debris material recovered for the entire project and the overall recovery rate achieved.
- B. The Final Recovery Report shall be prepared into one plan/report by Principal Project Company with data from all Principal Project Companies and submitted to the City.
  - 1. The Final Recovery Report shall be used as a submittal for compliance with the final waste report requirements of LEED version 4.0 MR Prerequisite Construction and Demolition Waste Management Planning. The Final Recovery Report shall include any and all required information to meet the LEED prerequisite.

## **1.8 JOB SITE ADMINISTRATION**

- A. Principal Project Company shall review the environmental goals of the Project with Principal Project Companies of all tiers.
- B. Principal Project Company shall make a proactive effort to increase awareness of these goals and ensure full compliance to the MRRP and LEED Construction and Demolition Debris Management Plan among Principal Project Company's employees, contractors, and other workers.
- C. Principal Project Company shall communicate the presence of demolition debris which is Hazardous Material to all workers on the job site and shall establish and clearly identify Hazardous Material storage areas. Principal Project Company shall discuss practices and alternatives to minimize worker exposure to potentially harmful substances expected to be encountered on the job site.
- D. Principal Project Company shall provide green, blue and black refuse bins and appropriate signs for all temporary field offices to separate recyclable and compostable materials from the trash and subscribe to adequate collection services. To subscribe to these services, contact Recology San Francisco at 415-330-1300

## **PART 2 - PRODUCTS (NOT USED)**

## **PART 3 - EXECUTION (NOT USED)**

**END OF SECTION**

## SECTION 02 41 16 - STRUCTURE DEMOLITION

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. Section Includes:
  - 1. Demolition and removal of existing building.
  - 2. Removing below-grade construction.
  - 3. Disconnecting, capping or sealing, and removing site utilities.
  - 4. Salvage of existing items
  - 5. Principal Project Company's Demolition Plan.
- B. Related Requirements:
  - 1. Temporary Facilities and Controls: Section 01 50 00; for temporary construction, protection facilities, and environmental-protection measures for building demolition operations.
  - 2. Information Sheet No. S-04 dated June 22, 2015 on the subject of Demolition Permits as published by the San Francisco Department of Building Inspection (SFDBI).

#### 1.2 DEFINITIONS

- A. Remove: Detach items from existing construction and legally dispose of them off-site unless indicated to be removed and salvaged or recycled.
- B. Remove and Salvage: Detach items from existing construction and deliver them to City as directed.
- C. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or recycled.

#### 1.3 ADMINISTRATIVE REQUIREMENTS

- A. Pre-Demolition Conference: Conduct conference at Project Site. Review methods and procedures related to building demolition including, but not limited to, the following:
  - 1. Inspect and discuss condition of construction to be demolished.
  - 2. Review structural load limitations of existing structures.
  - 3. Review and finalize Demolition Plan and verify availability of demolition personnel, equipment, and facilities needed to make progress and avoid delays.
  - 4. Review and finalize protection requirements.

#### 1.4 MATERIAL SALVAGE

- A. The City will hand over the site in the Leave-Behind Condition.

- B. Any items of interest or value to City that may be encountered during building demolition and are noted in this Agreement shall be salvaged and remain City's property.
- C. Carefully remove and salvage items or objects in a manner to prevent damage and deliver promptly to City unless otherwise specified.
- D. Coordinate with City any special procedures for removal and salvage.

#### **1.5 ACTION SUBMITTALS**

- A. Demolition Plan as specified below.

#### **1.6 INFORMATIONAL SUBMITTALS**

- A. Items enumerated under Part C of SFDBI Information Sheet No. S-04.
- B. Qualification Data: For demolition firm.
- C. Inventory: After building demolition is complete, submit a list of items that have been removed and salvaged.
- D. Pre-demolition photographs.
- E. Sustainable Design (LEED):
  - 1. General:
    - a. Submit information necessary to establish and document compliance with the LEED Certification goals for this Project.
    - b. Sustainable design submittals are in addition to other submittals.
    - c. If submitted item is identical to that submitted to comply with other requirements, submit duplicate copies as a separate submittal to verify compliance.
  - 2. The following information shall be provided:
    - a. Materials and Resources Credit for Construction and Demolition Waste Management: Comply with Section 01 74 50 "Material Reduction and Recovery Plan."

#### **1.7 DEMOLITION PLAN**

- A. The Principal Project Company shall submit a complete **Demolition Plan** detailing procedures and sequence for removing the existing structures including all features necessary to remove the structure in a safe and controlled manner to insure stability of the structure at any given time.
- B. Thoroughly investigate the condition of the existing structures to be removed before proceeding with the Demolition Plan.
- C. The Demolition Plan shall consist of the following:
  - 1. Detailed sequence of demolition and removal work, with starting and ending dates for each activity.
  - 2. Interruption of utility services.

3. Coordination for shutoff, capping, and continuation of utility services.
  4. Details and locations of shields or other protective measures in sufficient numbers to ensure that people, property and improvements will not be endangered.
  5. All other information as required and described in SFDBI Information Sheet No. S-04.
- D. The Principal Project Company's Engineer of Record shall be present at the site as required when removal operations are in progress. Should an unplanned event occur, the Engineer of Record shall report immediately the procedure of operation to correct or remedy the occurrence. The Engineer of Record shall report in writing within 24 hours of the event the details of the event and the procedure for correction. In addition, the Engineer of Record shall include proposed procedures to eliminate similar events in the future.

#### **1.8 QUALITY ASSURANCE**

- A. Demolition Firm Qualifications: An experienced firm that has specialized in demolition work similar in material and extent to that indicated for this Project.
- B. Regulatory Requirements: Comply with applicable Law.
- C. Standards: Comply with ANSI A10.6 and NFPA 241.

#### **1.9 PRECONSTRUCTION PHOTOGRAPHS**

- A. Before commencement of work on the site, take digital photographs of the surrounding properties from different vantage points. Coordinate vantage point locations with the City's Authorized Representative.
- B. Show existing conditions of adjoining construction and site improvements, including finish surfaces that might be misconstrued as cracking or other damage caused by the building demolition operations.
- C. Photographs shall:
  1. Provide factual presentation.
  2. Provide correct exposure and focus, high resolution and sharpness, maximum depth of field, and minimum distortion.
- B. Digital File:
  3. File Format: Joint Photographic Experts Group (JPEG), unless otherwise directed by Architect.
  4. Minimum Resolution: 12 mega pixels.
  5. Provide digital date/time imprint on each picture.
  6. Digital images shall be exactly as originally recorded in the digital camera, without alteration, manipulation, editing, or modifications using image-editing software.
- D. Deliver on USB flash drive or other digital means to City before work onsite begins.
- E. Prints are not required.

#### **1.10 FIELD CONDITIONS**

- A. Building to be demolished will be vacated and their use discontinued before start of Work.

- B. Promptly repair damage caused by demolition operations to existing adjacent structures and facilities to remain at no cost to the City. If the existing finished surface of the paving of City streets is damaged, it shall be repaired to the satisfaction of the City. Corrective work shall be at the Principal Project Company's expense.
- C. Hazardous Materials present in building and structures to be demolished shall be abated by the Principal Project Company under this Contract.

#### **1.11 TRAFFIC**

- A. Conduct demolition operations and the removal of debris to ensure minimum interference with streets, walks, and adjacent occupied or used facilities. Do not close or obstruct streets, walks, or other occupied or used facilities without permission from authorities having jurisdiction.
- B. Existing pedestrian sidewalks shall be kept open at all times unless otherwise approved by the City.

#### **1.12 TRAFFIC CONTROL SYSTEM FOR LANE CLOSURE**

- A. If street closure is required, comply with the provisions of Section 12, "Construction Area Traffic Control Devices," of the State of California Caltrans Standard Specifications.
- B. If any component in the traffic control system is displaced or ceases to operate or function from any cause during the progress of the work, the PPC shall immediately repair said component to its original condition or replace said component and shall restore the component to its original location.
- C. When a lane closure is made for work periods only, at the end of each work period, all components of the traffic control system, except portable delineators adjacent to the traveled way, shall be removed.

#### **1.13 UTILITY SERVICES**

- A. Maintain existing utilities indicated to remain, keep in service, and protect against damage during demolition operations.
- B. Do not interrupt existing utilities serving adjacent properties.

### **PART 2 - PRODUCTS (NOT USED)**

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Conduct a pre-construction survey of existing conditions and correlate the survey with requirements indicated to determine extent of building demolition and existing conditions of adjacent construction to remain. Survey shall be documented with the pre-construction photographs as specified.
- B. Inventory and record the condition of items to be removed and salvaged.
- C. When unanticipated mechanical, electrical, or structural elements are encountered, investigate and measure the nature and extent of the element. Promptly submit a written report to City.

- D. Perform an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during building demolition operations.
- E. Verify that hazardous materials have been remediated before proceeding with building demolition operations.

### **3.2 PREPARATION**

- A. Existing Utilities: Locate, identify, disconnect, and seal or cap off indicated utilities serving buildings and structures to be demolished.
  - 1. Arrange to shut off indicated utilities with utility companies.
  - 2. Do not start demolition work until utility disconnecting and sealing have been completed and verified in writing.
- B. Temporary Shoring: Provide and maintain interior and exterior shoring, bracing, or structural support to preserve stability and prevent unexpected movement or collapse of construction being demolished.
  - 1. Strengthen or add new supports when required during progress of demolition.

### **3.3 PROTECTION**

- A. Existing Facilities: Protect adjacent walkways, buildings, and other facilities during demolition operations.
- B. Temporary Protection: Erect temporary protection, such as fences and covered passageways, where required by authorities having jurisdiction and as indicated. Comply with requirements in Section 01 50 00 "Temporary Facilities and Controls."
  - 1. Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
  - 2. Provide protection to ensure safe passage of people around building demolition area and to and from occupied portions of adjacent buildings and structures.
  - 3. Protect walls, windows, roofs, and other adjacent exterior construction that are to remain and that are exposed to building demolition operations.

### **3.4 DEMOLITION**

- A. General: Demolish indicated existing buildings and structures completely. Use methods required to complete the Work within limitations of governing regulations.
- B. Do not use cutting torches until work area is cleared of flammable materials. Maintain fire watch and portable fire-suppression devices during flame-cutting operations.
  - 1. Maintain adequate ventilation when using cutting torches.
  - 2. Locate building demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
- C. Perform surveys as the Work progresses to detect hazards that may result from building demolition activities.

- D. Conduct building demolition and debris-removal operations to ensure minimum interference with City streets, walks, and other adjacent occupied and used facilities.
- E. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental-protection regulations. Do not use water when it may damage adjacent construction or create hazardous or objectionable conditions, such as flooding, and pollution.
- F. Below-Grade Construction: Demolish foundation walls and other below-grade construction. Remove below-grade construction, including basements, foundation walls, and footings, completely.
- G. Existing Utilities: Demolish and remove existing utilities and below-grade utility structures.

### **3.5 EXPLOSIVE DEMOLITION**

- A. Explosives: Use of explosives is not permitted.

### **3.6 SALVAGED ITEMS**

- A. Where required by this Agreement and when so directed to be salvaged and/or reused, remove item to be salvaged in the most careful manner possible to avoid damage; and, if damaged, such items shall be restored to conditions satisfactory to the City.
- B. Materials to be removed and not reused or salvaged shall become the property of the Principal Project Company, who shall be responsible for their timely removal from the Project Site and their legal disposal.
- C. Removed and Salvaged Items: Comply with the following:
  - 1. Clean salvaged items of dirt and demolition debris.
  - 2. Pack or crate items after cleaning. Identify contents of containers.
  - 3. Store items in a secure area until delivery to City.
  - 4. Transport items to City as instructed.
  - 5. Protect items from damage during transport and storage.
- D. Coordinate re-installation of salvaged items into new work with Project Schedule to assure installation in the Project.

### **3.7 SITE RESTORATION**

- A. Rough grade below-grade areas ready for further excavation or new construction.
- B. Completely fill voids resulting from building demolition operations that will not be required by new construction with satisfactory soil materials according to backfill requirements and recommendations of the Geotechnical Engineer.

### **3.8 REPAIRS**

- A. Promptly repair damage to adjacent construction caused by building demolition operations.
- B. Where repairs to existing surfaces are required, patch to produce surfaces suitable for new materials.

- C. Restore exposed finishes of patched areas and extend restoration into adjoining construction in a manner that eliminates evidence of patching and refinishing.

### **3.9 RECYCLING DEMOLISHED MATERIALS**

- A. General: Separate recyclable demolished materials from other demolished materials to the maximum extent possible. Separate recyclable materials by type.
- B. Provide containers or other storage method for controlling recyclable materials until they are removed from Project site.
- C. Transport recyclable materials off the Project Site and legally dispose of them as specified in Section 01 74 50 (Material Reduction and Recovery Plan).

### **3.10 DISPOSAL OF DEMOLISHED MATERIALS**

- A. Except for items or materials indicated to be recycled, salvaged, or otherwise indicated to remain City's property, remove demolished materials from Project site and legally dispose of them as specified in Section 01 74 50 (Material Reduction and Recovery Plan).
- B. Do not allow demolished materials to accumulate on-site.
- C. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
- D. Do not burn demolished materials.

### **3.11 CLEANING**

- A. Clean adjacent structures and improvements of dust, dirt, and debris caused by building demolition operations. Return adjacent areas to condition existing before building demolition operations began.

**END OF SECTION**

## SECTION 02 80 13 - HAZARDOUS BUILDING MATERIALS – REMEDIATION

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. Many of the materials and items of equipment used to construct the improvements and facilities at the Project Site contain materials known to the State of California to be either carcinogenic or reproductive toxins. Such hazards include but are not limited to asbestos-containing materials (that are not NOA), lead based paints, lead-containing materials and demolition associated with Hazardous Materials.
- B. This Section includes hazardous and toxic materials precautions, general requirements, and handling procedures as required to the work and existing conditions of the project. This Section includes requirements and procedures to be performed by Principal Project Company for the handling, removal, abatement, remediation, transportation and disposal of hazardous building materials.
- C. Hazardous Materials removal shall be conducted as per the construction phasing and staging described as specified in the Contract Documents.
- D. Principal Project Company shall perform all Hazardous Materials remediation work under the Contract Documents as described herein and in Section 01 35 44 Hazardous Building Materials – Scope of Work and Section 7.7 of the Agreement.

#### **1.4 DEFINITIONS**

- A. Activity Class/Category - Lead: Lead hazard designations assigned to work activities that involve lead-containing materials. Activities, which fall into Classes 1 through 3, including as examples the operations defined below, are required to assume the following personal airborne exposure levels, unless otherwise demonstrated.

<b>Lead Hazard Trigger Activities</b>	<b>Work Activity</b>
Trigger Task, Activity 1 Exposure Less than 500 micrograms/m <sup>3</sup>	Surface clean-up of lead-containing dust or debris less than 15,000 microgram/square feet Spray painting with lead-based paints Manual demolition of structures (e.g. drywall, plaster, etc.) Manual sanding, grinding, needle gunning, chiseling, hammering, wire brushing, milling or scraping of lead-based coatings Heat gun removal of surface coating power tool Power tool cleaning with dust collection system
Trigger Task, Activity 2 Exposure 500 micrograms/m <sup>3</sup> or greater but less than 2500 micrograms/m <sup>3</sup>	Using lead mortar Lead burning Rivet busting Power tool cleaning without dust collection systems Clean-up of dry abrasive Abrasive blasting enclosure movement and removal
Trigger Task, Activity 3 Exposure 2,500 micrograms /m <sup>3</sup> or greater	Abrasive blasting of coated surfaces Welding on coated surfaces Torching or cutting of coated surfaces Torch burning of coated surfaces

B. Asbestos Work Class: Activities for removing asbestos materials by categories as follows:

<b>Asbestos Activity Class/Category</b>	<b>Work Activity</b>
Work Class I	Activity involving removal of Thermal System Insulation (TSI) and surfacing Asbestos-Containing Materials (ACM) or friable Presumed – Asbestos Containing Materials (PACM).
Work Class II	Activity involving removal of ACM which is not TSI or surfacing material, including, but not limited to, wallboard, floor tiles and sheeting, roofing and siding shingles, naturally occurring asbestos (soil, rock, etc.) and construction mastics. Note also that Class II materials that cannot be removed intact, such as soil, require usage of respiratory protection at all times, regardless of personal monitoring data showing compliance to PEL and EL.
Work Class III	Repair and maintenance operations where TSI or surfacing is likely to be disturbed, which fits within one standard glove bag or waste bag.
Work Class IV	Maintenance and custodial activities during which employees contact but do not disturb PACM or ACM and activities to clean up dust, waste bag and debris resulting from Work Class I, II, and III activities.
Unclassified	Any activities dealing with materials containing detectable but <1.0 % asbestos.

- C. Certified Lead Worker: includes those who do lead-related Construction Work activities on the Project Site under the directions of a Certified Lead Supervisor, including:
  - 1. Removal, disposal or abatement of loose and peeling lead-based paints as defined by CDPH, including scraping, demolition or other Cal/OSHA Activity 1 through 3 work as defined above.
  - 2. Removal or repair of lead plumbing.
  - 3. Repainting or general construction on surfaces painted with lead-based paints.
    - a. Removal, enclosing or covering of lead-contaminated soils.
  - 4. Exemption: renovations, remodeling, painting, operations and maintenance work or other activities listed above that are considered to be interim controls, or lasting less than 20 years, may be completed by workers satisfying Cal/OSHA's asbestos awareness training requirements only.
- D. Certified Lead Supervisor: includes those who supervise daily work activities on a lead-related construction site, as well as supervision of repainting or general construction performed on surfaces with lead-based paints where abatement is designed to permanently reduce or eliminate lead hazards for public (non-industrial) buildings or to last more than 20 years. The Certified Lead Supervisor shall oversee the Certified Lead Workers, enforce safe work practices, and schedule and coordinate work site activities with the building occupants and other contractors and consultants.
- E. Containment: as defined by the California Department of Public Health includes any system, process or barrier used to contain lead hazards in a work area, including plastic sheeting, wet scraping, and other lead-safe work practices as described in the HUD Guidelines, Chapter 8.
- F. Remediation: abatement, removal, control or containment of hazardous or toxic material(s).

## 1.5 SUBMITTALS

- A. Principal Project Company shall submit copies of any notice of safety and environmental violations received from the regulatory agencies that they may have received in the last 20 years in the USA.
- B. Principal Project Company shall submit copies all the minimum qualification licensing requirements required under Section 01 35 44 Hazardous Building Materials - Scope of Work.
- C. Principal Project Company shall submit proof of its five (5) years of Hazardous Materials abatement and/or removal experience asked for in Section 01 35 44 Hazardous Building Materials - Scope of Work.
- D. Principal Project Company or its Hazardous Materials abatement Principal Project Company shall submit proof of its environmental training requirements asked for in Section 01 35 44 Hazardous Building Materials - Scope of Work.
- E. BAAQMD-issued Approval Letter for Asbestos Demolition. "[Job Number]". For all demolition of buildings and structures, regardless of whether asbestos is present or not, Principal Project Company shall submit a copy of the BAAQMD-issued Approval Letter for Asbestos for Demolition, "[Job Number]" to the SAR group within the City Public Works Department prior to the start of demolition. To obtain this letter, Principal Project Company shall submit an Asbestos Demolition Notification to the BAAQMD through their web-based Online Asbestos Notification System (<http://learn.baaqmd.gov/course/view.php?id=4#section-5>) at least ten (10) business days prior to the start of any demolition.

- F. As per Section 01 35 44 Hazardous Building Materials - Scope of Work, Principal Project Company shall submit a Hazardous Materials Management Plan (HMMP) with the following documentation listed below. The HMMP shall be submitted no later than ten Days before start of Work at the Project Site or NTP2, whichever is earlier and before commencement of demolition activities. **No hazardous materials work may start without the HMMP reviewed and approved by the SAR group within the City Public Works Department.**
- G. The Hazardous Materials Management Plan (HMMP) is Principal Project Company's comprehensive plan for the management of Hazardous Materials encountered during the Work for the Project. The HMMP shall include the following Plans and information:
1. An asbestos abatement work plan.
  2. A lead hazard/removal control plan.
  3. A waste management plan (WMP).
  4. Information about Principal Project Company's designated Project safety representative (PSR) as per Section 01 35 44 Building Related Hazardous Materials - Scope of Work, and Section 01 35 45 Health and Safety Criteria. Include his/her training certification, qualifications; his/her name, phone number; fax number, and pager number.
  5. Management spill procedures in the event of asbestos or any hazardous materials release or any event that may require modification or abridgment of site control and decontamination procedures.
  6. Intended methods of compliance for hazardous materials handling work, including description of engineering controls, personal protective equipment as well as compliance monitoring as applicable.
  7. Schedule and sequence of work for all hazardous materials work.
  8. Worksite layout diagram: Detailing location of each regulated area and construction of each containment identifying location of each decontamination units, fire extinguishers and emergency exits.
  9. A copy of the Site-Specific Hazard Communication Plan in accordance with federal and California OSHA requirements.
  10. Copies of required licenses, certifications and notifications to handle and control hazardous materials.
- H. As part of Principal Project Company's HMMP, Principal Project Company shall submit a Waste Management Plan (WMP). The WMP is Principal Project Company's comprehensive plan for waste management of hazardous and non-hazardous waste generated during the remediation work of this project. The WMP shall include the following:
1. Information about the designated persons who will implement the plan. Include his/her name, phone number, and his/her roles and responsibilities for implementing the plan.
  2. Waste segregation procedures for waste generated from demolition debris, abatement, and stabilization.
  3. Proposed location of locked dumpster, if applicable.
  4. Sampling plan and protocol for waste characterization in accordance with 22 CCR §66262, et. seq.

5. Handling, segregation, and waste load-out procedures for hazardous and non-hazardous waste, including TSCA-regulated waste. Include diagrams showing regulated areas for waste segregation, load-out stations, paths of travel for off-hauls of waste, and engineering controls to prevent air pollution and potential exposures to airborne contaminants.
  6. Waste hauler identification, information, 24-hour contact number, and copy of licenses.
  7. Asbestos and lead waste disposal sites identification. Include name, address, 24-hour contact number.
- I. For Asbestos Containing Construction Materials (ACCM), or Asbestos Containing Material (ACM), as applicable by regulation, and as part of the Hazardous Materials Management Plan (HMMP) Principal Project Company shall submit the following, but not limited to:
1. Asbestos Pre-job Submittals:
    - a. Proof of current asbestos contractor's license issued by the California Principal Project Company's State License Board.
    - b. Proof of current California Department of Industrial Relations (CA-DOSH or Cal/OSHA) asbestos contractor's registration certification.
    - c. Valid and current Bay Area Air Quality Management District (BAAQMD) notification for the Project (as applicable).
    - d. Cal/OSHA 24-hour notice per 8 CCR 1529.
    - e. Worker documentation, including:
      - 1) Current AHERA training certification - supervisor/competent person
      - 2) Current AHERA training certifications for workers.
      - 3) Respiratory fit test records within past 12 months.
      - 4) Annual medical examination approvals for respirator use.
    - f. Written asbestos abatement work plan and schedule with the sequence of work.
    - g. Material Safety Data Sheets.
    - h. Emergency phone numbers, pagers and email addresses.
    - i. Aerosol Challenge Testing Certification
      - 1) Aerosol challenge testing using dioctylphthalate (DOP, also known as Bis(2-ethylhexyl) phthalate) or an approved alternative is required for all equipment fitted with High Efficiency Particulate Air (HEPA) filters including negative pressure units, air machines, fan units and vacuum cleaners.
      - 2) Prior to use, testing must be performed on site:
        - (a) Whenever equipment enters the site.
        - (b) After replacement of HEPA filters or any other significant repairs or alterations.

- 3) Equipment which fails testing shall be marked and promptly removed from the site.
  - 4) Equipment which has passed testing shall be marked with a unique identifier number and the date of the testing. The identifier number shall be reflected on all testing documentation.
  - 5) Recognized alternatives to DOP include, but are not limited to 4 centistoke (4 cSt) viscosity grade polyalphaolefin (POA) fluids such as Emery 3004 POA and selected mineral oils. Testing equipment modification and/or recalibration may be needed to use DOP alternatives.
- j. Rotameter calibration data calibrated by a primary standard within past 6 months.
- k. Periodic Submittals: Submitted upon request during abatement:
- 1) Principal Project Company's personal air monitoring results (daily)
  - 2) Updated workers documentation (as needed)
  - 3) Daily boundary access logs
  - 4) Daily negative pressure manometer records (print outs), as applicable
  - 5) Copies of updated schedules and notices to the regulatory agencies (as needed)
- l. Project closeout Submittals: Within 5 calendar days upon request by the SAR group within the City Public Works Department or within 5 calendar days after completion of the abatement or hazard control work, Principal Project Company shall submit the following:
- 1) Copies of updated schedules and notices to regulatory agencies, as needed.
  - 2) Receipt and weight tickets from landfill operator or incinerator, as applicable.
  - 3) Copies of completed uniform waste manifests.
  - 4) Certification of completion.
- J. For lead-related Work, and as part of the Hazardous Materials Management Plan (HMMP) Principal Project Company shall submit the following, but not limited to:
1. Pre-job Submittals: Principal Project Company shall submit documents pertaining, but not limited, to the following:
    - a. San Francisco Department of Building Inspections (DBI) notification and posting requirements as deemed required for exterior paint remediation.
    - b. Cal/OSHA notifications as per 8 CCR 1532.1
  2. Workers documentation:
    - a. Current CDPH lead contractor/supervisor training certificates.
    - b. Current lead awareness training certificates - workers or CDPH Certified Lead Workers Certificate, as appropriate.

- c. Respiratory fit test records within past 6 months.
  - d. Annual medical examination approvals.
  - e. Blood lead tests within past 90 days.
3. Lead hazard/removal control plan pursuant to 8 CCR 1532.1: Procedures for minimizing and controlling the migration of lead from disturbance of lead-containing materials including a written lead hazard or lead removal work plan and schedule with the sequence of work:
  4. Project close-out Submittals: Within 5 calendar days upon request by the SAR group within the City Public Works Department, or within 5 calendar days after completion of the abatement or hazard control work, Principal Project Company shall submit the following:
    - a. Updated worker documentation, as needed.
    - b. Principal Project Company periodic personal air monitoring results.
    - c. Receipt and weight tickets from landfill operator or recycler, as applicable.
    - d. Waste profiling data (TCLP, WET, and other analytical data)
- K. For Copper Chromate Arsenate (CCA) treated wood related Work:
1. As part of the Hazardous Materials Management Plan (HMMP), Principal Project Company shall submit the following, but not limited to:
    - a. Identification of EPA-approved hazardous waste landfill disposal facility, or an EPA-approved solid waste disposal facility.
    - b. Temporary storage plan.
  2. Workers documentation:
    - a. Certification of the workers and supervisor's forty (40) hour HAZWOPER training in compliance with 40 CFR 1910.120.
    - b. Medical examination approvals for respirator use within the past twelve (12) months, or in compliance with 8 CCR 5144.
    - c. Respiratory fit test records within the past twelve (12) months minimum, or in compliance with 8 CCR 5144.
  3. Within 5 calendar days upon request by the SAR group within the City Public Works Department or within 5 calendar days after completion of the abatement or hazard control work, Principal Project Company shall submit the completed manifest or evidence of shipment date, recycler, and quantities shipped.
- L. For fluorescent light tube related Work
1. As part of the Hazardous Materials Management Plan (HMMP), Principal Project Company shall submit the following, but not limited to:
    - a. Identification of EPA-approved recycler.
    - b. Temporary storage plan.

2. Project close-out Submittals: Within 5 calendar days upon request by the SAR group within the City Public Works Department, or within 5 calendar days after completion of the abatement or hazard control work, Principal Project Company shall submit the completed manifest or evidence of shipment date, recycler, and quantities shipped.

## 1.6 QUALITY CONTROL

### A. Meetings

1. Pre-abatement meeting: Prior to any removal of Hazardous Materials and upon approval of the HMMP, Principal Project Company shall arrange and attend a pre-construction meeting with the SAR group within the City Public Works Department, the City's Authorized Representative, and others whose work may be affected. The meeting agenda shall include the following considerations:
  - a. Weekly Meetings: At the option of the SAR group within the City Public Works Department, abatement work extending over one week in length may require attendance of Principal Project Company at a weekly progress meeting. The purpose of this meeting is to review abatement and project scheduling, coordination with other trades, security and site-specific requirements.
  - b. Start-up Hazardous Materials handler's meeting: Prior to the beginning of on-site work, all Hazardous Materials handlers shall attend a pre-start-up safety meeting that addresses hazardous materials issues specific for the project.
  - c. Review of the specifications and plans in detail related to the abatement and hazards control work. All conflicts and ambiguities, if any, shall be discussed.
  - d. Review in detail the Project conditions, schedule, construction sequencing, site protection, protection of historic building materials abatement application requirements, and quality of completed work.
  - e. Review in detail the means of protecting adjoining areas; protection of Principal Project Company's employees and contractors, City's employees and contractors, and completed work during the abatement and lead removal activities.
  - f. Pre-job submittals requirements.
  - g. Site security requirements.

### B. Field Quality Control Sampling

1. During all asbestos-related work, perimeter sample(s) shall be collected by the City's Certified Industrial Hygienist or its environmental consultant (DOSH Certified Asbestos Consultant). These sample(s) shall be analyzed by Phase Contrast Microscopy (PCM). Sample results that are in excess of the background level or 0.010 fibers per cubic centimeter (f/cc) Project Action Level may be forwarded for analysis by Transmission Electron Microscopy (TEM) with a 12-hour turnaround specified. Handling, shipping, and analysis charges (including the Environmental Consultants time and expenses) shall be paid for by Principal Project Company. Any sample results in excess of 70 asbestos structures per square millimeter of filter area (corrected for a 1,200 - 1,800 liter sample volume as appropriate, or in excess of 0.018 str/cc, normalized to a 1,500-liter air sample) shall require cleaning, inspection, and resampling of the affected area at Principal Project Company's expense.
2. During all lead-related work, such as demolition, torching and welding activities, etc., as applicable, visual inspections, perimeter air sample and/or lead wipe sample results shall be collected by the City's Certified Industrial Hygienist or its environmental consultant

(DOSH Certified Asbestos Consultant). These samples shall be analyzed by flame atomic absorption.

C. Clearance and Re-occupancy Sampling

1. Asbestos Clearance Sampling

- a. Clearance samples will be collected by the SAR group within the City Public Works Department or their designee at the completion of the asbestos abatement activity. Clearance will be either by visual inspection and/or phase contrast microscopy (PCM) and/or aggressive air sampling - transmission electron microscopy (TEM). The City reserves the right to conduct AHERA clearance criteria and limit the number of samples for clearances to be less than AHERA protocol when the City deems appropriate.
- b. Clearance air samples using aggressive air sampling techniques shall be collected for all abatement zones, unless otherwise designated in the Contract Documents.
- c. Phase Contrast Microscopy (PCM) Clearances: Areas cleared by PCM shall show an airborne concentration of total fibers for each sample at or below 0.010 fibers per cubic centimeter (f/cc) using the NIOSH 7400A counting rules. Any sample result exceeding 0.010 fibers/cc shall require re-cleaning of the work area and retesting. The City as Regulator will determine the minimum number of samples, based on the quantity and types of materials removed configuration, and sequencing of the work areas, and similar considerations.
- d. When transmission electron microscopy (TEM) clearances are conducted, as designated by the Contract Documents, analysis shall be conducted by using the method described in 40 CFR Part 763, Appendix A, Subpart E (AHERA), with an analysis turn-around time of 24 hours, unless otherwise designated by the City as Regulator. Z-test requirements under the AHERA regulations shall **NOT** apply to the Project. The TEM clearance standard is 0.018 s/cc for **ALL** samples (equivalent to 70 s/mm<sup>2</sup> for a 1500-liter sample volume). The City as Regulator may opt to adjust the sample volume to prevent possible overloading of the samples from interference dusts (e.g., demolition, welding particulates), if so, the analytical sensitivity shall be at or below 0.005 s/cc, maintained by having adequate number of grids analyzed by the laboratory.

2. Lead Wipe Sampling

- a. All areas with regular occupancy affected by disturbance, demolition or scraping of painted surfaces shall be cleared by wipe sampling. Lead wipe sampling will be collected immediately prior to area occupancy.
- b. The SAR group within the City Public Works Department or its designee will collect clearance wipe samples after approving the work area cleanliness based on visual inspection. The wipe samples will be collected from building surfaces, NOT from plastic sheeting or other temporary barriers. Principal Project Company shall re-clean the area if surface lead concentrations exceed any of the following HUD definitions for lead contaminated dust:
  - 1) <10 micrograms/ft<sup>2</sup> for interior floors
  - 2) <10 micrograms/ft<sup>2</sup> for interior horizontal surfaces other than floors
  - 3) <100 micrograms/ft<sup>2</sup> for exterior floor and horizontal surfaces, window sills and troughs

- c. All reoccupancy/clearances will be based on floors and any interior horizontal surfaces. Routine use of other levels is not expected and are for use only as determined by the City as Regulator on a case by case basis. Areas that do not meet the HUD lead contaminated dust criteria shall continue to be cleaned by Principal Project Company at its expense until the specified criteria is achieved. Only after passing re-occupancy clearance, shall Principal Project Company teardown the containment and demobilize.
- d. Where lead remediation occurs concurrently with asbestos remediation activities, the area may be cleared (in addition to the wipe samples) by aggressive air sampling, where airborne lead concentrations following the final visual inspection shall not exceed the EPA's NAAQS standard of 1.5 micrograms/m<sup>3</sup> as analyzed by NIOSH method 7082 (flame atomic absorption) or 7105 (graphite furnace atomic absorption) or ICP/MS.

D. Final Clearance Criteria

- 1. The City will pay the cost of the final round of visual inspections, aggressive air sampling, and PCM and/or TEM analyses that will meet the asbestos abatement specification. All rounds of visual inspections, aggressive air sampling, and PCM and/or TEM analyses that fail to meet the contract criteria shall be borne by Principal Project Company. For the purpose of this paragraph, visual inspection includes the area isolation inspection, pre-encapsulation inspection, and final area clean-up inspection.
- 2. If wipe sampling for re-occupancy clearance fails the HUD lead contaminated dust criteria, Principal Project Company shall be responsible for additional clean-up costs until clearance is achieved.
- 3. Principal Project Company shall pay for all environmental consultant costs for delays in completion of work beyond the Project Schedule. Such charges shall include consultant's observations and inspections, daily air monitoring, equipment, transportation and analysis charges. Such costs are estimated at \$1,200 per day, exclusive of any costs associated with final clearance air testing.

E. Inspections

- 1. Work Area Inspections: Inspections are required at the completions of the following job phases:
  - a. Pre-cleaning inspection(s)
  - b. Work area preparation inspection (Pre and post 24-hour hold times)
  - c. Pre-encapsulation inspection
  - d. Final visual inspection
  - e. Waste handling inspection
- 2. Principal Project Company shall provide in writing a signed or initialed request for inspection to the SAR group within the City Public Works Department. Request all inspections at least 24 hours in advance of the time required; inspections shall be performed between the hours of 8:00 a.m. and 3:00 p.m., Monday through Friday, unless otherwise noted. Written requests may be waived, and verbal requests accepted for short-duration projects at the discretion of the SAR group within the City Public Works Department. Adequate lighting is to be provided by Principal Project Company.

3. Precede all inspection requests by an evaluation by the Construction Manager, who shall verify that criteria for acceptability have been met prior to requesting an inspection.
4. Pre-cleaning Inspection:
  - a. The SAR group within the City Public Works Department or its designee shall inspect all surfaces requiring pre-cleaning to verify that dust and debris have been removed and cleaned up to an acceptable condition. Multiple inspections may be required to cover all systems and the required phasing of activities.
  - b. No object shall be covered until inspected or approved by the SAR group within the City Public Works Department or its designee as stated in the requirements herein. When covered before such inspections are made and approved, Principal Project Company shall uncover such work for inspection, subsequently restore it, and replace work of others damaged thereby, all at Principal Project Company's expense.
5. Work Area Preparation Inspection:
  - a. After preparing the work area and decontamination enclosure system(s) for Activity Class I and II work areas, as applicable, the SAR group within the City Public Works Department or its designee shall conduct an initial inspection to ensure completeness of work and type containment according to the specifications.
  - b. No hazardous material removal work shall commence without the approval of the SAR group within the City Public Works Department following a work area preparation inspection.
6. Pre-Encapsulation Inspection:
  - a. After detail cleaning has been completed and the Principal Project Company has checked and approved the area as adequately cleaned, the SAR group within the City Public Works Department or its designee shall inspect all surfaces requiring encapsulation to verify that hazardous materials have been removed and the area and abated surfaces leaned to an acceptable condition.
  - b. During such inspections, Principal Project Company shall provide adequate lighting, ladders, scaffolding, workers, etc., so as not to curtail the systematic inspection of all surfaces by the SAR group within the City Public Works Department or its designee. Areas requiring rework shall be tagged in a manner to allow continuation of the inspection in a timely manner. The SAR group within the City Public Works Department or its designee shall not be expected to remain within an area requiring extensive re-cleaning.
  - c. The pre-encapsulation inspection may be staged to allow inspection of detailed surfaces concurrent with the removal activities in adjoining areas ready for inspection, allowing a buffer zone to protect against cross-contaminating inspected surfaces. For lead removal: a final overall inspection shall be required to reconfirm the final wipe down of all horizontal surfaces, which may have been subjected to contamination from airborne releases during the staged inspection process. The staging of inspections shall not preclude Principal Project Company from conducting internal quality control inspections prior to requesting review by the SAR group within the City Public Works Department or its designee.
7. Final Visual Inspection: After the encapsulation process is complete, the encapsulant is dry, and all debris bags, tools, supplies, and equipment have been removed from the work area, as applicable, the SAR group within the City Public Works Department or its

designee shall inspect the work area to verify the cleanliness of the area, including but not limited to public and attic areas. The work area must be free of visible debris, dust, water, or loose and peeling lead-based paints as a minimum.

8. Waste Handling Inspection: The SAR group within the City Public Works Department or its designee shall inspect waste as it leaves the regulated area. Principal Project Company shall insure that all waste is packaged, labeled, and handled as required. The SAR group within the City Public Works Department or its designee may inspect the waste dumpsters at any time, including prior to transportation. Principal Project Company shall coordinate temporary relocation to a transport staging area with the SAR group within the City Public Works Department or its designee prior to removal.

## 1.7 ADDITIONAL CONTRACT REQUIREMENTS

- A. Specific mandatory asbestos abatement requirements for *occupied and unoccupied spaces* at San Francisco sites are more stringent than current regulations. This summary of additional requirements is not to be read as a stand-alone document.
  1. If work procedures are going to change, the SAR group within the City Public Works Department and the City's Authorized Representative must be notified, in writing, and given the opportunity to notify surrounding employees as the new procedures may impact surrounding areas (e.g., noise, vibration).
  2. Localized occupants must be notified in writing of limited access to the work areas prior to the start of project.
  3. Principal Project Company is responsible for coordinating with the SAR group within the City Public Works Department as to where the exhaust air is to be directed and to ensure the exhausted air will not be recirculated within the facility prior to the initial setup of the work area.
  4. A rigid and robust secondary perimeter with "Caution Construction" sign or equivalent. The secondary perimeter shall be a full height, 1-hour fire-rated, dust and sound proof construction barricade as per the architectural drawings for the Project.
  5. The regulatory signage is to be posted between the secondary construction perimeter and the regulated work area.
  6. All equipment shall be inspected by the SAR group within the City Public Works Department or its designee prior to being brought into the hospital. All equipment and supplies shall be free of dust and debris.
  7. On-site aerosol challenge testing of negative air machines and HEPA vacuums prior to start of work and every 90 days for longer projects, when machines are relocated between floors. The aerosol challenge testing shall be conducted in the work area.
  8. Sufficient quantities and types of dehumidifier units shall be installed and operated within the construction area to reduce humidity levels to 40% relative humidity.
  9. Method of sealing critical barriers including the capping of ducts, supply registers, etc. shall be dust tight and capable of withstanding air flow and pressure generated by the ventilation system. Tape and/or polyethylene sheeting alone shall not be used to seal the supply registers.
  10. Negative pressure differential of -0.04 inches of water with manometer reading records is required for all areas at all times during abatement and general construction activities.

Downgrading of negative pressure during construction may be considered on a case by case basis.

11. The negative pressure enclosure shall maintain the minimum Negative pressure differential of -0.04 inches of water for at least 24 hours prior to the start of abatement unless otherwise approved by the SAR group within the City Public Works Department. Following 24-hours, the SAR group within the City Public Works Department and its environmental consultant will review the containments to determine if the integrity of the containments has been maintained. The Containment will have passed when the following 3 conditions are met:
  - a. Containment integrity has been maintained for at least 24-hours; and
  - b. Negative pressure has been maintained at least at -0.04" w.g. for 24-hours; and
  - c. The SAR group within the City Public Works Department and the environmental consultant are satisfied that the containment has been constructed sufficiently so as to last for at least two months without modifications, repairs or improvements.
12. In negative pressure enclosures, a calculated air exchange rate of no less than 10 air exchanges per hour for the entire area in which the renovation activities are being performed.
13. Installation of clear, transparent view ports made of plastic or equivalent, in the polyethylene wall so that activities can be visually monitored from outside the containment. This window shall measure approximately 1' wide by 2' high. It shall remain transparent throughout the duration of the abatement process. It is recognized that viewing ports are not possible in all situations.
14. Adhesive tack ("sticky") mats with multiple layers shall be installed at all construction barricade entrances to prevent tracking of construction dust outside of the construction area.
15. The removal of debris shall be in tightly covered containers, and only at times and routes approved by the SAR group within the City Public Works Department and facility personnel.
16. All HEPA equipment, tools, decontamination chambers, etc. shall be clean upon entering the Project Site. Typically, the equipment and materials are inspected at a loading dock prior to bringing them into the facility. NOTE: The use of decontamination showers is limited to Class I work only unless otherwise specified by the abatement work plan.
17. Principal Project Company is responsible for ensuring that water is properly shut off at lavatory/faucet fixtures at the beginning and ending of each shift.

## **PART 2 - PRODUCTS**

### **2.1 GENERAL**

- A. Prohibited Materials
  1. Mastic or paint removers shall not result in the generation of hazardous waste.
  2. Cleaning agents, equipment, and methods employed shall not in any way damage the substrate or adjoining surfaces and finishes which are to remain. Cleaning solvents shall be non-injurious to the surfaces upon which they are applied. The methods used shall cause no pitting, erosion or damages to the surfaces.

3. Paint removal chemicals may not attach or leave deposits on the substrate material.
  4. The following tools and equipment are specifically prohibited unless accepted in writing by the SAR group within the City Public Works Department:
    - a. High- or low-pressure water-blasting equipment for hosing of ductwork or work areas.
    - b. Gasoline, propane, diesel or other fuel powered equipment inside the building.
  5. Equipment that creates excessive noise or vibration that would affect safety of the building or its occupants or generate complaints from the occupants. Equipment shall not exceed an A-weighted sound level of 85 dB as measured at 50 ft. from the radiating source.
  6. Asbestos-containing materials shall not be disturbed by cutting, sawing, grinding, pulverizing, crumbling, breaking, or otherwise rendered friable or airborne unless these activities are conducted under the requirements of all applicable regulations and guidelines by trained certified workers.
- B. Minimum Requirements:
1. Deliver all materials in original packages, containers, or bundles bearing the names of the manufacturers and the brand names and details for proper storage and usage. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient to prevent damage or contamination. Store materials so as not to interfere with Project Site operations.
  2. Do not use damaged or deteriorating materials. Remove damaged materials from the premises. Dispose of contaminated materials in accordance with applicable regulations.

## **2.2 MATERIALS AND EQUIPMENT**

- A. Principal Project Company shall ensure that following materials and equipment shall be available on the Project Site:
- B. Protective Devices: Temporary wash stations or showers, disposable clothing, respirators, gloves, hard hats, and other required items. Respirators shall protect against appropriate dusts, fumes and mists as approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH) under provisions of 30 CFR Part 11.
- C. Waste Receptacles: Conform to federal and State regulations, with 6-mil minimum thickness waste bags.
- D. Polyethylene Sheeting and Dust Barriers
  1. Polyethylene sheeting shall be flame-retardant and approved and listed by the State Fire Marshal in accordance with Section 13121 and/or 13144.1 of the California Health and Safety Code.
  2. Thickness and Size: 6-mil thick minimum, unless otherwise specified, sized to minimize the frequency of joints.
  3. Flammability: Comply with NFPA Standard 701 with a flame spread rating of no greater than 5 and a smoke development rating of no more than 70 when tested in accordance with ASTM accordance with ASTM E84 procedures.

- E. Protective Devices to conform to the following:
1. Polyethylene drop cloths and dust barriers, temporary wash stations or showers, disposable clothing, respirators, gloves, hard hats, and other required items.
  2. Respirators shall protect against asbestos and other appropriate dusts, fumes and mists as approved by the National Institute for Occupational Safety and Health (NIOSH) under provisions of 30 CFR Part 11.
- F. Sealants:
1. Sealants shall, at a minimum, conform to the following:
    - a. Shall be Fire resistant
    - b. Shall be compatible with concrete, metals, wood, cable jacketing and other materials capable of preventing fire, smoke, water and toxic fumes from penetrating through sealants.
    - c. Shall be asbestos free and shall have a flame spread, smoke and fuel contribution of zero.
    - d. Shall be ASTM- and UL-rated for 3 hours for standard method of fire test for fire stop systems.
  2. Spray adhesives shall not contain methylene chloride or methyl chloroform (1,1,1-trichloroethane) compounds.
  3. Adhesive tape shall comply, at a minimum, with the following.
    - a. Must be 2" or wider, shall be capable of sealing joints of adjacent sheet of polyethylene and attaching polyethylene sheet to finished or unfinished surfaces of similar materials.
    - b. Tape shall be capable of adhering under dry and wet conditions, including use of amended water. Complete taping to critical or sensitive surfaces utilizing preservation sealing tape, such as:
      - 1) 3M Scotch Brand No. 4811 Preservation Tape; or
      - 2) 3M Scotch Brands No. 472 Plastic Film Tape.
- G. Surfactants and Encapsulants:
1. Wetting agents or surfactants shall be effective and compatible with the ACM being wetted.
  2. Bridging or penetrating type encapsulants shall have the following characteristics:
    - a. Water based. Do not utilize an organic solvent in which the solid parts of the encapsulant are suspended.
    - b. Non-flammable with no methylene chloride.
    - c. U.L. listed encapsulants, in full-scale ASTM E119 fire test, compatible with W.R. Grace "Retroguard, RG-1" fireproofing with "Spatterkote" Type SKII" bonding treatment for structural and decking widths exceeding 24 inches.

- d. Compatible with replacement materials, especially mastics, fireproofing, and adhesives.

H. Mastic and Paint Removers to conform to the following:

1. Non-flammable solvent or gel, with a flash point above 140 degrees Fahrenheit.
2. Of low odor type.
3. Solvent waste shall not result in the generation of hazardous waste as described under 22 CCR, Division 4.
4. Removers shall NOT contain methylene chloride, halogenated hydrocarbons, or any of the following glycol ethers:

Common Name	Abbreviation	CAS #	Chemical Name
Ethylene glycol methyl ether	EGME	109-86-4	2 - methoxyethanol
Ethylene glycol methyl ether acetate	EGMEA	110-49-6	2- methoxyethyl acetate
Ethylene glycol ethyl ether	EGEEA	111-15-9	2- ethoxyethanol
Ethylene glycol dimethyl ether	EGDME	110-71-4	1,2-dimethoxyethane
Ethylene glycol diethyl ether	EGDEE	629-14-1	1,2 - diethoxyethane
Diethylene glycol	DEG	111-46-6	2,2 - dihydroxyethyl ether
Diethylene glycol methyl ether	DEGME	111-77-3	2-(2-methoxyethoxy) ethanol
Diethylene glycol ethyl ether	DEGEE	111-90-0	2- (2-ethoxyethoxy) ethanol
Diethylene glycol dimethyl ether	DEGDME	111-90-6	Bis-(2-methoxyethoxy) ether
Triethylene glycol dimethyl ether	TEGDME	112-49-2	2,5,8,11-tetraoxadodecane
Dipropylene glycol	DPG	110-98-5	2,2 - dihydroxyisopropyl

- I. Vacuums and Negative Pressure Units (NPU) used for cleanup of materials and detailing shall be HEPA-filtered, clean, without significant dents, marring, or otherwise unprofessional appearance. Coordinate with the Environmental Consultant for inspection and approval prior to bringing this equipment into a building. Conduct DOP testing on-site in the presence of the City as Regulator's environmental consultant for all HEPA-filtered units.

J. Air filtration devices shall, at a minimum, conform to the following:

1. Filtration devices shall be high efficiency particulate absolute (HEPA) filtration systems bearing a UL 586 label indicating its ability to perform under specified conditions. Filters shall be marked with the name of the manufacturer, serial number, airflow rate efficiency and resistance, and the direction of the test airflow. Provide units with two stages of pre-filtering, as follows:
  - a. A low efficiency type first stage pre-filter for particle sizes 100 micrometers and larger.

- b. A medium efficiency type second stage pre-filter effective for particle sizes down to 5 micrometers.
  - c. Pre-filters installed either on or in the intake grid to the exhaust unit and held in place with special housings or clamps.
2. HEPA-filtration exhaust units are to include:
- a. An elapsed time meter showing the total accumulated hours of operation.
  - b. An electrical interlock preventing operation of the unit without a HEPA filter.
  - c. An automatic shutdown system to stop the fan in the event of a rupture in the HEPA filter or a blocked air discharge.
  - d. Warning lights to indicate normal operation (green), moderately high pressure drop across the filters, such as due to filter overloading (yellow), and too high of a pressure drop due to an overloaded or ruptured HEPA filter or obstructed discharge (red).
  - e. An audible alarm if the unit shuts down due to operation of the safety systems.
  - f. Electrical components approved by the National Electrical Manufacturers Association (NEMA) and the Underwriter's Laboratories (UL). Each unit shall be equipped with overload protection sized for the equipment. Properly ground the motor, fan, fan housing, and cabinet.
  - g. A cabinet constructed of steel or aluminum capable of withstanding damage from rough handling and transportation, with a width under 30-inches to fit through a standard-size doorway, mounted on casters or wheels.
  - h. Several spare HEPA-filtered exhaust units on-site to be used as needed if active units fail.
- K. Waste Containers:
- 1. Waste receptacles to conform to federal and State regulations, with 6-mil minimum thickness or glove bags or waste bags.
  - 2. Sealable drums shall be of 30- or 55-gallon capacity constructed of fiber or metal with tightly fitting lids for hazardous waste disposal. Label the drums and bags in accordance with U.S. EPA and local air quality management district requirements, including the Generator I. D. number or location identification, and manifest number. Provide air and watertight drums. If previously used, the drums shall be food grade and shall be approved by the City as Regulator prior to their storage or use on-site. Sealable polyethylene bags shall be of 6-mil minimum thickness for asbestos disposal. Size bags to fit within drums specified above.
- L. Cleaning Agents:
- 1. Cleaning agents, equipment, and methods employed shall not in any way damage the substrate or adjoining surfaces and finishes. Cleaning solvents shall be non-injurious to the surfaces upon which they are applied. The methods used shall cause no pitting, erosion or damages to the surfaces.
  - 2. Do not use chemicals that may attach or leave deposits on the substrate material. Modify the process or processes to suit the finish, hardness, and condition of the surface to be cleaned.

## **PART 3 - EXECUTION**

Principal Project Company shall:

### **3.1 EXAMINATION**

- A. Review Hazardous Materials reports and information and ensure the information is available to all contractors and trades working on the Project Site.
- B. Promptly notify the SAR group within the City Public Works Department of differing conditions or for suspected materials not identified or listed under Section 01 35 43.
- C. Notify the SAR group within the City Public Works Department, in writing, a minimum of 48 hours in advance of any planned disturbances to any Hazardous Materials or prior to performing any Hazardous Materials abatement.
- D. Disturbance of asbestos or lead and other Hazardous Materials, including demolition, surface preparation, or removal of paint, can contaminate air, soil, and water surrounding the Project Site. It is the responsibility of Principal Project Company to evaluate and determine the most appropriate level of containment necessary to prevent the uncontrolled release of Hazardous Materials from the work site.
- E. As per Cal/OSHA regulatory requirements, establish the required site controls, class of containment, of ventilation, and of air monitoring as appropriate for the removal means and methods as selected to perform the specific removal work. These systems shall be sufficient to control exposures to workers, the public, and to protect the surrounding environment.

### **3.2 PREPARATION**

- A. Protective Procedures and Workers Protection
  - 1. Protect Visitors and Other Site Personnel: Cordon off the Hazardous Materials removal and hazard control area(s) with appropriate signs, and provide temporary tunneling or scaffolding, as applicable.
  - 2. Provide site security to assure that no member of the public or any unqualified or untrained person is able to gain access to any Hazardous Materials work area at any time while maintaining open access and egress routes at all times.
  - 3. Provide worker training, respiratory protection, and medical examinations to meet applicable regulations.
  - 4. Provide temporary lighting and power to work areas, including installation of ground fault interrupters as required. Ensure that all electrical power is terminated in the work area, and ensure, among others, outlets and lights are disconnected and cannot be re-energized during the course of the Work. Fully ground all equipment within the work zone and decontamination assemblies.
  - 5. Construct enclosure system(s) for worker and equipment decontamination.
  - 6. Establish negative pressure in work area(s) as required under 8 CCR Section 1529. Follow and follow hazard control procedures as outlined under Cal/OSHA regulations CCR 1532.1 and CDPH regulations 17 CCR Sections 35001 through 36100.
  - 7. Provide workers with sufficient sets of protective full-body clothing to be worn in the designated work area and whenever a potential exposure to lead, asbestos, and hazards exists. Such clothing shall include but not be limited to full-body coveralls, headgear, eye

protection, and gloves. Disposable-type protective clothing, headgear, and footwear may be provided.

8. Respiratory Protection: Comply with Cal/OSHA Regulations included in 8 CCR Sections 1529, 1532.1 and ANSI Standard Z88.2, "Practices for Respiratory Protection: Workers shall wear appropriate respiratory protection during lead, asbestos and any other hazards work, unless negative exposure assessment testing verifies that employee exposures are below the PEL or Action levels.

B. Site Protective Controls:

1. Locate temporary scaffolding and dust barriers, as required, and proceed with the construction or demolition, allowing for continued operation of any adjacent occupied areas, as applicable.
2. Erect temporary protective covers over pedestrian walkways and at points of passage for persons or vehicles, which are to remain operational during the work.
3. Where life safety systems shall be made non-operational, coordinate shutoff with SAR group within the City Public Works Department. Protect all wiring associated with the system.
4. Air Filtration Device
  - a. Differential air pressure systems for each work area to be in accordance with Appendix J of the EPA's "Guidance for Controlling Asbestos-Containing Materials in Buildings," EPA 560/5-85-024.
  - b. Minimum work area differential air pressure of -0.025 inches w.g. at all times when required, including during the removal, gross clean-up, waste transfer, and encapsulation activities. Account for fluctuations of the negative pressure by aiming for a higher-pressure differential at the project outset to ensure that the chances of the pressure differential dipping below -0.025 inches w.g. are minimal.
  - c. Provide sufficient number of units for each work area to maintain differential air pressure in the work area at -0.025 inches w.g. between the work area and adjacent non-work areas at all times, allowing for stack and thermal effects. Locate unit(s) so that the primary make-up air enters the zone through the decontamination facilities and traverses the work area as much as possible, unless otherwise approved by the SAR group within the City Public Works Department.
  - d. Provide on-site certification of all HEPA-filtered negative pressure units to document adequate filtration efficiency for all units exhausting internally within the building or as otherwise required by the SAR group within the City Public Works Department. Systems shall be certified by a third-party to conduct onsite dioctylphthalate (DOP) or Portacount challenge testing, signed by an independent tester or Principal Project Company's Site Safety Representative. DOP testing shall verify an in-situ efficiency of 99.97% or greater. Portacount testing shall verify an in-situ efficiency of 99.3% or better.
5. Exhaust Air:
  - a. Establish negative pressurization within the work area exhausting air ducted through temporary panels located in window frames or exterior doorways. Such panels must be designed to prevent rainwater from entering the work area.
  - b. Unless otherwise directed by the SAR group within the City Public Works Department, Principal Project Company shall replace any windows removed at the

completion of Hazardous Materials removal work. Vent exhaust air to the exterior of the building at locations approved by the SAR group within the City Public Works Department unless otherwise noted or directed.

- c. Do not locate exhaust outlets near or adjacent to other building intake vents or louvers or at the entrances to the building. Do not exhaust air into the building interior spaces or within 50 feet of the building's supply air intakes, unless otherwise noted or directed by the SAR group within the City Public Works Department.

#### 6. Decontamination Enclosure Systems

- a. Construct a decontamination enclosure system (as a minimum) in accordance with OSHA Regulation 29 CFR Part 1926.1101 and Cal/OSHA Regulation 8 CCR Sections 1529 and 1532.1. The systems shall be contiguous to the work area consisting of three totally enclosed chambers and airlocks. Mobile isolation enclosures shall be permitted in areas where space limitations shall not permit such construction.
- b. For Work Class I, II and III work areas, provide, at a minimum, a two (2)-stage decontamination assembly, including an equipment and contiguous clean room with bucket wash-up facilities. A shower will be required if the work is greater than 25SF.
- c. Post all emergency phone numbers, notifications, emergency exiting diagrams and procedures, as required.
- d. Post danger signs at the entrance to all decontamination units, per OSHA Regulation 29 CFR Part 1926, 1529 and 1532.1.
- e. The SAR group within the City Public Works Department must approve location of decontamination enclosure systems prior to commencing Construction Work.
- f. Mobile isolation enclosure(s) shall be constructed of rigid frames (either 2 x 4-inch wood construction or PVC tubing, as appropriate) and polyethylene sheeting or rigid plexiglas sheets. Do not tape, nail, puncture or disturb asbestos containing building materials to attach, or secure the mini enclosure system.
- g. No eating, drinking, smoking, or chewing gum or tobacco is permitted in or near the asbestos or lead work areas or decontamination enclosure systems except in areas designated by the SAR group within the City Public Works Department. Smoking will not be permitted in the clean room and near storage or usage areas of flammable materials, such as spray adhesive and mastic removers.

### 3.3 ASBESTOS ABATEMENT PREPARATION

#### A. Notifications:

- 1. Notify the SAR group within the City Public Works Department, in writing, a minimum of 48 hours in advance of any asbestos-abatement work.
- 2. Notify, in writing, the BAAQMD at least 10 working days prior to commencement of any asbestos project equal or greater than 100 linear feet (LF) or more than 100 square feet (SF) or 35 cubic feet or more of regulated asbestos-containing materials. Obtain a job number.

3. Notify Cal/OSHA a minimum of 24 hours in advance of any disturbances of any amount of friable or non-friable asbestos-containing materials or prior to performing asbestos-related work.
  4. Advise Project Safety Representative of suspect conditions. Do not remove or disturb suspect materials until tested and approved by the SAR group within the City Public Works Department or its designee.
- B. Prohibited Activities:
1. Asbestos-containing materials shall not be disturbed by cutting, sawing, grinding, pulverizing, crumbling, breaking, or otherwise rendered friable or airborne unless these activities are conducted under the requirements of all applicable regulations and guidelines.
  2. Only a registered Asbestos Abatement Principal Project Company per Cal/OSHA regulation 8 CCR 1529 shall complete Work exceeding 100-sq. ft. or 100 linear feet or 35 cubic feet of asbestos-containing construction materials.
- C. Demolition of non-ACM obstructing known intact ACM:
1. Remove non-contaminated and non-asbestos materials for access using standard dust control procedures as required for painted assemblies and construction housekeeping controls.
  2. Minimize disturbances to substrates concealing friable or damaged asbestos-containing materials, such as laid-in ceiling tiles concealing asbestos-containing fireproofing, demolition of non-ACM partitions which may destabilize sprayed-on asbestos-containing acoustical finishes, etc. Qualified workers shall conduct work impacting asbestos-containing materials.
- D. Unexpected exposure to known or suspect Asbestos-Containing Material (ACM):
1. Where ACMs are discovered intact, such as intact pipe lagging, proceed to cordon off the affected area and immediately post it with a "caution" sign to prevent unintentional disturbances. Immediately alert Principal Project Company's site safety representative of the conditions for proper removal and disposal procedures.
  2. Where ACMs are damaged or suspect asbestos contaminated conditions are encountered, discontinue work in the immediate suspected area, shutdown the area's HVAC system, if not already disengaged, and alert Principal Project Company's site safety representative of the conditions for proper removal and disposal procedures.
- E. Unexpected release of asbestos into the environment:
1. Cordon off the immediate area (10 to 20 ft. radius minimum), and shutdown the area's HVAC system (if applicable).
  2. Notify the City's Authorized Representative and the **City Environmental Health and Safety Department** immediately.
  3. Notify Principal Project Company's site safety representative for proper removal and disposal using wet methods and HEPA-filtered vacuums. Clean-up work shall be completed under the directions of a Asbestos Competent Person with 16-hour minimum EPA operations and maintenance asbestos training and by workers with 2-hours asbestos awareness training minimum unless exposures exceed the permissible exposure limit (PEL) of 0.1 fibers/cc.

4. Decontaminate or dispose of friable waste in double 6-mil thick goose necked labeled waste bags for manifesting and disposal.

F. Work area set up and protection:

1. Principal Project Company shall carry out the following:

- a. Pre-Cleaning

- 1) Work Areas: Pre-clean surfaces in workspace. If the space has any contamination in the opinion of the SAR group within the City Public Works Department, then Principal Project Company shall install air locks and negative pressure system prior to pre-cleaning.
- 2) Fixed Objects: Pre-clean all fixed objects within the proposed work areas using HEPA filtered vacuum equipment and/or wet cleaning methods, as appropriate. Enclose with a layer of 6-mil polyethylene sheeting sealed with tape unless specified otherwise.
- 3) Ductwork: Pre-clean and wrap all active and inactive ductwork within the zone with a minimum of two layers of 6-mil polyethylene sheeting sealed with tape, unless otherwise directed by the SAR group within the City Public Works Department.
- 4) Removable Objects: Pre-clean removable objects within the proposed work areas exposed to friable ACM or debris using HEPA filtered vacuum equipment and/or wet cleaning methods, as appropriate. Properly remove and dispose of objects from work area before abatement operations commence.
- 5) Work area surfaces or items scheduled to remain covered with polyethylene sheeting during the clearance air sampling shall be inspected and approved by the SAR group within the City Public Works Department upon completion of pre-cleaning before critical barriers are erected or any other removal procedures are initiated.
- 6) Principal Project Company shall inspect all of its equipment and shower pans that it brings to the work site before and after its use and ensure that such equipment is not contaminated.

- b. Critical Barriers

- 1) Seal off all openings, including but not limited to corridors, doorways, ducts, grilles, diffusers, pipe chases, drains, grates, and any other penetrations of the work areas, with 6-mil polyethylene sheeting sealed with tape. Use caulking where necessary to ensure a complete seal.
- 2) Except for emergency exits, doorways, which will not be used for passage during work, must be sealed by first applying tape over the gap between the closed door and the doorframe and the gap between the bottom of the door and the floor. Then apply 6-mil polyethylene sheeting over the door and seal it with tape to the wall and to the floor.
- 3) Seal windows by applying two layers of 6-mil polyethylene sheeting sealed independently to the wall with tape.

- 4) HVAC registers and returns shall be sealed with metal or rigid plastic covered by polyethylene sheeting. Polyethylene sheeting is not an acceptable alternative.
- 5) At any time during the abatement activities after barriers have been erected, if visible suspect dust is observed outside of the work area or if the barriers are damaged, work in the abatement area shall immediately stop. Repair the barriers, and clean-up debris/residue using appropriate HEPA vacuuming and wet cleaning procedures before work recommences.

c. Regulated Work Area Isolation and Controls

- 1) Establish a pressure differential of -0.025 inches w.g. with manometer reading records. Submit manometer readings daily or upon request.
- 2) Conduct DOP testing of the HEPA-filtered negative pressure units and vacuum cleaners on site.
- 3) Install a transparent view port per work area for inspections.
- 4) Notify the SAR group within the City Public Works Department for changes in work practices immediately to allow the City the opportunity to notify and prepare the surrounding properties if the new procedures may impact the surrounding areas (due to noise, vibration, etc.).
- 5) Use a calibrated manometer to monitor the negative pressure, and provide the manometer print out to the SAR group within the City Public Works Department or designee at the end of the work shift.

d. Full Isolation Work Areas - Sequence of Major Events

- 1) This subsection outlines the sequence of events only. Modify the sequence as required if the work area is considered contaminated or if demolishing ACM or non-asbestos materials is required for access to the required abatement materials. Refer to other applicable sections of this specification for detailed requirements.
- 2) Cordon off the area with appropriate signs.
- 3) Deactivate HVAC system, unless otherwise noted or directed.
- 4) Protect or remove carpeting, if present, as appropriate. Contaminated carpeting will require decontamination by steam cleaning or disposal, as directed by the SAR group within the City Public Works Department.
- 5) Pre-clean work area, as necessary.
- 6) Establish temporary power and lighting.
- 7) Construct critical barriers.
- 8) Construct decontamination enclosure systems. All work areas shall contain a worker decontamination enclosure system and an equipment decontamination enclosure system, unless otherwise noted or directed.
- 9) Erect 6-mil polyethylene sheeting on the walls, windows, ceiling and floor, as applicable.

- 10) Establish negative pressure within the work area.
- 11) Request and facilitate a second work area preparation inspection from the SAR group within the City Public Works Department or designee following demolition and preparation of the final critical barriers, where applicable.
- 12) Remove ACM employing wet cleaning methods, HEPA vacuuming and proper work practices.
- 13) Clean-up work area.
- 14) Dispose of asbestos-containing waste.
- 15) Work area final clean up.

### **3.4 HAZARDOUS MATERIALS REMOVAL PROCEDURES FOR CONTROLLED RENOVATION**

- A. Principal Project Company shall have in place controlled renovation procedures for installation of anchors and minor disturbances to Asbestos- Containing Material under one hundred square feet (<100 SF) or under one hundred linear feet (<100 LF), except thermal system insulation (TSI) or surfacing materials (including but not limited to vinyl floor tiles, carpet or tile mastics, transite board, sheetrock wallboard, ceiling tile mastics) and carry out or comply with the following:
1. Minor work affecting non-friable materials, such as drilling molly anchors into wallboard or seismically bracing equipment through asbestos-containing may be completed by trained construction workers or maintenance personnel following procedures under the General Industry Asbestos Standards, 8 CCR 5208. All operations and maintenance procedures and personnel training records must be pre-approved by the SAR group within the City Public Works Department or its designee or prior to commencement of activities.
  2. Demarcate the area of exposure to minimize traffic within the area and to protect persons outside the area from airborne asbestos exposures, even if a negative exposure assessment has been produced.
  3. Assemble equipment and supplies, including but not limited to a Hudson sprayer, an HEPA- filtered vacuum, polyethylene drop cloths and wetted sponges.
  4. Install a drop cloth below the area to be disturbed on the floor and other surfaces and shoot or drill the anchor through the wetted sponge or cut the material through a wetted sponge, as applicable. HEPA vacuum the area following all work and place the sponge and debris into a sealed plastic disposal bag. Do not use these procedures on asbestos-containing thermal system insulation (TSI) or asbestos-containing surfacing materials, such as asbestos fireproofing or acoustical sprayed-on plaster finishes.
  5. Immediately clean up all debris dislodged from coring or drilling through asbestos and trace asbestos substrates using a wetted sponge and HEPA vacuum. HEPA vacuum the area immediately following completion of the controlled renovation procedures. Dispose of the debris as non-friable asbestos waste. Contamination of the site by use of improper procedures will require extensive clean-up and clearance air sampling by the City as Regulator, at Principal Project Company's expense.
  6. The following materials are classified as not "surfacing" materials for controlled renovation purposes involving anchoring or minor disturbances:
    - a. Vinyl Floor Tiles: Cordon off the room or area and remove the floor tiles before drilling through the concrete or wooden substrate. Vinyl floor tiles can be removed using heat or manual means such as hand scrappers. Where tiles cannot be

removed in advance of coring, saturate the tile with shave cream and core through the tiles, frequently wiping up all chips and debris and disposing as Category 1 non-friable waste. Wet wipe with a clean sponge and HEPA vacuums the area upon completion of work. Seal off the area below the core capture any debris that can fall into the ceiling plenum or crawl space below.

- b. Carpet Mastics: Cordon off the room or area and cutout the carpeting and mastics using a carpet knife, saturating the carpet with water to prevent airborne asbestos fiber releases. Remove excess mastics using a mastic remover with a flash point greater than 140 deg. F., as approved by the SAR group within the City Public Works Department or designee. Dispose of the carpet segment and mastics as Category 1 non-friable waste. Wet wipe and HEPA vacuum the area following completion of the controlled renovation procedures.
  - c. Vinyl Floor Tile Mastics: Cordon off the room or area and remove the mastics using a mastic remover with a flash point greater than one hundred and forty degrees Fahrenheit (>140 deg. F.), as approved by City. Dispose of the mastic and rags as Category 1 non-friable waste. Wet wipe and HEPA vacuum the area following completion of the controlled renovation procedures.
  - d. Transite Board and Mastics: Cordon off the room or area and remove the board intact, where feasible, following installation of drop cloths below. If removal is not feasible, drill through the board using the shaving cream methods described.
  - e. Sheetrock Wall or Ceiling Board: Shoot or drill anchors through a wetted sponge, where feasible, or use a Hilti-brand rotohammer drill equipped with a spring-loaded local exhaust hood connected to a HEPA-filtered vacuum cleaner. Cordon off the room or area and cut holes for receptacles or other devices using drop cloths on the ground and wet methods. Remove the sheetrock avoiding the joint compounds, where feasible. Continually wet the controlled renovation area during the process and wet wipe and HEPA vacuum the area following completion of the controlled renovation procedures.
  - f. Thin-Layered Asbestos-Containing Paints: Shoot or drill anchors through a wetted sponge or use a Hilti-brand rotohammer drill equipped with a spring-loaded local exhaust hood connected to a HEPA-filtered vacuum cleaner, where feasible. Cordon off the room or area and core using drop cloths on the ground and wet methods. Continually wet the controlled renovation area during the process and wet wipe and HEPA vacuum the area following completion of the controlled renovation procedures. Dispose of the paints as Category 1 or 2 non-friable wastes as determined by the substrate's composition.
  - g. Linoleum Backing: Cordon off the room and work area and cutout the linoleum, using a carpet knife prior to coring. Wet the backing using water and shave cream and remove the asbestos containing backing intact. Dispose of debris as friable asbestos waste. Wet wipe and HEPA vacuum the area of the controlled renovations for final clearance. Do not allow linoleum on cores to fall into the ceiling plenum or the space below, as applicable.
7. Other Non-Friable Materials: Complete controlled renovation procedures in compliance with Cal/OSHA's Work Class 2 procedures per 8 CCR 1529.
8. A Cal/OSHA & DOSH registered, and licensed Asbestos Abatement Principal Project Company shall complete work equal or greater than one hundred square feet (100 SF) or one hundred linear feet (100 LF) or asbestos-containing construction materials or other work as required in the Abatement Work Plan.

- B. Principal Project Company shall implement controlled procedures for installation of anchors or coring through friable asbestos materials, including but not limited to sprayed-on or troweled-on acoustical plasters, structural fireproofing, and linoleum backing (as applicable), and carry out the following:
1. Avoid contact with friable ACM where practical. Anchor to non-ACM materials where feasible.
  2. Install drop cloths on the ground and use a glovebag or mini-containment constructed of 6-mil polyethylene sheeting to contain work affecting friable materials.
  3. Wet the ACM with water and remove limited material as required for installations. Immediately clean up all debris and seal the waste in a double 6-mil disposal bag for disposal as asbestos waste.
- C. When conducting core drilling through ACM, Principal Project Company shall:
1. Assemble equipment and supplies, including but not limited to Hudson sprayers, nylon brushes, HEPA vacuums, labeled polyethylene disposal bags, approved encapsulant, duct tape, 5-in-1 tools, plastic buckets, etc.
  2. Coordinate exact location of the core hole, marking the location on the underside of the structure. Spray material to be disturbed with an approved penetrating encapsulant, restricted to the area of removal and disturbance only.
  3. Remove asbestos-containing materials following set-up of the isolation area under full isolation procedures or glove bag removal procedures.
  4. Cordon off the area with appropriate signs and deactivate the HVAC systems, as appropriate.
  5. Isolate the area with a mini-containment and decontamination assembly, and pre-clean and wrap fixed items and surfaces, as appropriate. Establish a mini-containment and decontamination assembly in the floor below.
  6. Establish negative pressure within the mini containment.
  7. Begin coring from the floor above, protecting against water seepage or spraying near active electrical or telephone equipment. After coring is complete, double bag, and encapsulate the raw edges of the cored hole with an approved penetrating encapsulant.
  8. Clean up any residual debris and insert a non-conductive sleeve into the hole, extending 6-inches minimum below the asbestos coating. Properly secure the sleeve and seal the openings around the circumference with a fire-rated caulking or seal.
  9. Dispose of ACM waste and proceed with the final work area clean up and inspection.
- D. With respect to hanger installation, Principal Project Company shall:
1. Assemble equipment and supplies, including but not limited to Hudson sprayers, nylon brushes, HEPA vacuums, labeled polyethylene disposal bags, approved encapsulant, duct tape, 5-in-1 tools, plastic buckets, etc.
  2. Lightly wet the material with an approved penetrating encapsulant, using a 5-gallon bucket lined with a plastic bag as a catch basket during the installation of the hanger or anchor. Cut an appropriately sized hole in the bottom of the bucket for the anchor grip to reach through. Place the plastic bag in the bucket, and with one hand, push the bottom of the anchor through the hole in the bucket sandwiching the plastic bag between the

anchor and the gun grip. Locate the anchor location and push the bucket tight against the material before setting the anchor. Carefully lower the bucket and the gun and dispose of the waste gathered in the bag and any loosened materials.

3. As an alternative to the above procedures, lightly wet the material with an approved encapsulant, placing a 3" x 5" sponge dampened with encapsulant against the material. Shoot the anchor or drill through the sponge so that any localized loosened material is trapped between the sponge and substrate. Leave the sponge in place, removing any signs of loose or dislodged debris. Re-spray any loosened materials with an approved encapsulant, restricted to the area of the disturbance.
  4. Clean-up the immediate area using wet methods and a HEPA vacuum. Dispose of friable plasters, linoleum backing, fire proofing and thermal system insulation as friable asbestos waste.
- E. With respect to coring on Fireproofing and Textured Acoustical Plasters, Principal Project Company shall:
1. Cordon off the area and set-up negative pressurization of the controlled renovation activity using glovebag or mini-containment methods. Do not drill or core openly through friable ACM. A Certified Asbestos Worker only under Cal/OSHA Work Class I or III procedures, as applicable shall complete such work. Wet the materials throughout the controlled renovations. Do not allow ACM on cores to fall into the ceiling plenum or Crawl Space below. Following the controlled renovation activities, clean up the mini containment using wet methods and a HEPA vacuum. Gooseneck and dispose of the glovebags, where applicable, within a double waste bag.
- F. Principal Project Company shall work within crawl spaces, confined spaces, or plenums with *Thermal System Insulation (TSI): Control Renovation Procedures for Friable Asbestos Materials*, and carry out the following:
1. Core or anchor through adjoining non-ACM materials, where feasible. If not feasible, cordon off the area and set-up negative pressurization of the controlled renovation activity using glovebag or mini-containment methods per 8 CCR 1529.
  2. Do not drill or core openly through friable ACM. Wet the materials throughout the controlled renovations. Do not allow ACM on cores to fall into the ceiling plenum or Crawl Space below. Following the controlled renovation activities, clean-up the mini containment using wet methods and a HEPA vacuum. Gooseneck and dispose of the glovebags and waste in double goose necked bags as friable asbestos waste.
  3. Adhere to all the requirements for confined spaces as follows:
    - a. It is the responsibility of Principal Project Company to provide all equipment and assistance to make the confined space safe for entry by Principal Project Company's employees, the City, the City as Regulator, and its representatives in accordance with the California Code of Regulations, Title 8, General Industry Safety Orders entitled "Confined Spaces."
    - b. If any activities associated with confined space entry become necessary, Principal Project Company shall be required to consult the City as Regulator for guidance and prepare an appropriate Permit-Required Confined Space Entry Plan.
- G. For asbestos-containing sheetrock and joint compound, Principal Project Company shall:
1. Lightly spray the material to be disturbed by spot removal, drilling, etc., with an approved penetrating encapsulant, restricted to the area of disturbance only. For anchoring into

ACM, locate the attachment location and push an encapsulant-wetted sponge between the stud or joist and the existing sheetrock before setting the anchor. Carefully shoot the anchor or drill through the stud or joist and sponge, and HEPA-vacuum any loosened materials or debris. For small-scale removals, penetrate the material with care, using a sharp utility knife or other appropriate tools, removing the encapsulated section and catching it directly into a lined bucket or waste disposal bag, where feasible, disposing of as asbestos waste. HEPA-vacuum the edges of the remaining materials and re-encapsulate the friable edges of the remaining sheetrock with penetrating encapsulant. Do not disturb materials beyond the limited scope of work.

### 3.5 HAZARDOUS MATERIALS REMOVAL PROCEDURES

- A. When removing asbestos-Containing Thermal System Insulation (TSI), Principal Project Company shall carry out or comply with the following:
1. Set-up a full isolation containment or a secondary containment for all glovebags abatement areas. Install critical barriers with two layers of polyethylene sheeting on the floors and on the walls. Set up a full decontamination system with shower for quantities greater than 25 LF, unless otherwise directed by the Contract Documents.
  2. Areas with evidence of damaged TSI will require HEPA-vacuuming of the access to this debris as well as vacuuming of all piping, ductwork and substrate materials within a minimum five (5) ft. radius of all such contamination.
  3. Use wet methods and HEPA vacuums. The removal of TSI shall be sufficient to accommodate access by applicable trades within the plenum, wall cavity or crawl space zone for routing of conduit, cables, etc. Coordinate with abatement of other applicable materials.
  4. Pipe Insulation Removal: Cut and separate metal bands, where appropriate. Locate the section length (typically three feet) and cut around the circumference at the end of the attached section. Twist the section to ensure it is free from the pipe. Using an airless sprayer, saturate the exterior of the covering with amended water to limit fiber release. Locate the upper and lower half seam and position one seam at the top of the pipe. After positioning, cut along the length of the section and carefully open each half. Immediately saturate the exposed inner surface thoroughly with amended water. Lower both halves into 6-mil polyethylene disposal bags. Do not place or allow insulation to fall on the floor. Pick-up debris falling on the floor and place it in disposal bags immediately. Clean to remove all debris remaining on the pipe.
  5. Fitting Insulation: Saturate fitting insulation with amended water. Remove fitting insulation using scraping tools, hand pressure and brushing. Immediately saturate the exposed inner surface thoroughly with amended water. Do not remove insulation by striking or chipping the surfaces. Deposit fitting insulation directly into 6-mil disposal bags. Do not place or allow insulation to fall on the floor. Pick-up debris falling on the floor and place it in disposal bags immediately. Clean to remove all debris left on fitting.
  6. At a minimum, use glove bags procedures as per Cal/OSHA Regulation 8 CCR 1529, Asbestos Activity Class/Category - Work Class I when removing Asbestos – Containing Thermal System Insulation (TSI) materials.
  7. Disassemble the pipping tanks and mechanical component on the boiler and heater systems using wet methods. Saturate the packing ACM before removing the bricks, pipes, and other ACM insulated (tar paint, canvas, materials).

8. Dispose of TSI and packing material in double goose necked-labeled bags or double wrap cutout sections in 6-mil polyethylene sheeting and properly labeled as friable asbestos waste.
- B. With respect to removing friable insulation, fireproofing, acoustical plaster, and, laid-in, splined or glued-on acoustical tiles, Principal Project Company shall comply with the following:
1. Mist asbestos material with amended water, using airless sprayers, or spray equipment recommended by the surfactant manufacturer and capable of providing a "mist" application to reduce the release of fibers. Saturate the material sufficiently to wet it to the substrate without causing excessive dripping or de-lamination of the material. Mist the asbestos material continuously during work process to maintain damp conditions and to minimize asbestos fiber dispersion, but without accumulating water on the floor.
  2. Remove ACM and overspray from all surfaces, including but not limited to structural steel, deck, walls, ceilings, ducts, insulation, piping, conduit, junction boxes, cables, etc.
  3. Remove the saturated ACM in small sections. As it is removed, place the material in sealable plastic bags. Do not allow materials to dry out prior to insertion into the bags. Do not permit materials to accumulate on floors and other surfaces in the work area.
  4. After removing the ACM, wet and wipe all surfaces, or use a soft-bristle brush to remove all residual accumulated material. Clean all surfaces with special emphasis on the top edge of the Spray-Poly or polyethylene covers.
- C. With respect to removing asbestos floor coverings, Principal Project Company shall comply with the following:
1. Mastic removal solvents, procedures, and equipment information submittals must be approved prior to floor coverings removal.
  2. In flooring areas where a solvent-based mastic remover is to be applied, Principal Project Company shall use a low odor mastic remover. Principal Project Company shall submit the Safety Data Sheets (SDS) of the mastic remover it intends to use, for the review and approval of the SAR group within the City Public Works Department or designee. After the application of a solvent-based mastic remover, Principal Project Company shall rinse the flooring areas by wet-mopping, applying "simple green cleaner" or equivalent, scrubbing floors, and finalize the clean up by re-mopping with clean water. Principal Project Company shall provide adequate ventilation to exhaust out the odors from the solvent-based mastic remover. Principal Project Company shall ensure that no odors from the solvent-based mastic remover remain.
  3. Vinyl floor tiles adhering to old non-ACM linoleum or tiles may require removal of the sub flooring intact to remove the overlying asbestos-containing mastic residues. For demolition projects, remove leveling compounds under VAT and non-VAT removal areas as asbestos containing unless otherwise noted.
  4. Use an approved mastic removal solvent following the manufacturer's recommended procedures. Wipe residual material and dispose of waste and rags in a proper manner.
  5. Where removing the mastic is feasible without the use of solvents, use water with liquid dishwashing detergent (1 ounce of detergent to 1 gallon of water), and scrub surfaces as required to remove residual material, scraping the wetted surface with a stiff-bladed wall or floor scraper. Wipe residual material and dispose of rags as ACM waste. Wet vacuum standing water with a HEPA vacuum.

6. Use of an approved portable shot abrasive "bead blaster" system that strips, cleans, and etches the floor, shall follow the manufacturer's recommended procedures. This method can dislodge sprayed-on fireproofing and/or sprayed-on acoustical plasters on the floor below due to excessive vibrations, where applicable. Therefore, adhesion and cohesion testing of these materials shall be conducted prior to the bead blaster's use. Usage of this system will require a variance from Cal/OSHA and the local Air Quality Management District as a "dry removal" method and approval by the SAR group within the City Public Works Department.
  7. Use of a buffer for mastic removal will require wet buffing only. Using a buffer will render the mastic onto a friable state. Principal Project Company shall conduct mastic removal using a buffer following the BAAQMD Regulation 11, rule 2. Buffer brushes shall be disposed of after each use as asbestos waste. Thoroughly remove all mastic residues from the buffer before removal from the work area.
- D. With respect to removing vinyl floor tiles and mastics, Principal Project Company shall comply with the following:
1. Remove the flooring and mastics as indicated on the Contract Drawings using full isolation procedures, satisfying the requirements of Cal/OSHA Regulation 8 CCR 1529, Work Class II.
  2. Set-up critical barriers and splash guards and establish negative pressurization.
  3. Remove the tiles using wet methods to minimize breakage and airborne fiber releases.
  4. Remove the mastic using an approved mastic remover.
  5. HEPA vacuum the contained area following abatement for clearance.
  6. Provide a full decontamination system with shower for areas exceeding 25 SF.
  7. Dispose of tiles and mastic as Category 1 wastes.
- E. With respect to removing linoleum flooring and mastic, Principal Project Company shall comply with the following:
1. Remove the flooring and mastics as indicated on the Contract Drawings using full isolation procedures, satisfying the requirements of Cal/OSHA Regulation 8 CCR 1529, Work Class II and BAAQMD Regulation 11, Rule 2.
  2. Set-up critical barriers and splash guards and establish negative pressurization.
  3. Remove the linoleum backing using wet methods to minimize breakage and airborne fiber releases.
  4. Remove the mastic using an approved mastic remover.
  5. HEPA vacuum the contained area following abatement for clearance; minimize use of encapsulant on substrates to be retiled.
  6. Provide a full decontamination system with shower for areas exceeding twenty-five square feet (>25 SF).
  7. Dispose of linoleum backing and mastics as friable asbestos waste.
- F. With respect to removing electrical/Wiring Insulation, Principal Project Company shall comply with the following:

1. Remove wiring by cutout of the conduit in manageable sections, where possible. Otherwise, pull the wire through the conduit with a properly sized sponge wetted with encapsulant tied to the distal end, misting the insulation continually and HEPA vacuuming any residual debris. Avoid unnecessary cutting or peeling.
  2. Clean up the area and dispose of the asbestos-containing waste. Wire bundles may be wrapped in burlap or cardboard, prior to bagging, to protect against penetrating the disposal wrapping.
- G. With respect to removing tar-coated electrical wrap, Principal Project Company shall comply with the following:
1. After confirming that the systems have been de-energized, including the proper deployment of log out/tag out procedure, remove materials using full isolation or mini-containment procedures, satisfying the requirements of Cal/OSHA 8 CCR 1529 Work Class 2 procedures. Use wet methods for dust controls. Dispose of materials as non-friable asbestos waste.
- H. With respect to removing ACM paint of ceiling plasters, Principal Project Company shall comply with the following:
1. Remove materials using full isolation or mini-containment procedures, satisfying the requirements of Cal/OSHA 8 CCR 1529 Work Class 2 procedures. Use wet methods for dust controls. Dispose of materials as non-friable asbestos waste. Remove substrates as required to access materials and overspray.
  2. Removal of larger ceiling segments, particularly demolition of elements that may impact paint finishes (see Demolition Plans), shall be completed under full isolation or mini-/mobile containment procedures by a licensed abatement contractor. The asbestos contractor using glovebag and mobile mini-containment methods or full isolation methods, depending on the quantities impacted, shall complete coring greater than two (2) inch diameter, which cannot be properly controlled using a wetted sponge.
  3. If a mobile containment is used, clean-up and reseal the phone booth-type containment and airlock entry between uses.
- I. With respect to removing window and door glazing compounds, Principal Project Company shall comply with the following:
1. Remove windows and doors following abatement of other interior finishes and materials and wrap in a double layer of polyethylene sheeting, where feasible.
  2. Where complete removal and disposal of the frames is not feasible, scrape the glazing compound following installation of polyethylene drop cloths under each window or door.
  3. Scrape residual compounds from wood or metal frames, as applicable. Double bag and dispose of materials as Category I non-friable waste unless otherwise directed by the SAR group within the City Public Works Department or designee.
- J. With respect to removing exterior/perimeter windows and door caulking, Principal Project Company shall comply with the following:
1. Cordon off the work area, installing critical barriers at the windows, doors, and other penetrations, as applicable.
  2. Remove ACM using wet methods per Cal/OSHA Regulation 8 CCR 1529, Work Class II.

3. Set-up drop cloths on the ground and nearby objects to contain falling materials on the ground or public access areas surrounding the work area.
  4. HEPA vacuum the sills and frames following abatement.
  5. Provide a full decontamination system with shower for areas exceeding 100 sf.
  6. Remove residual caulking from perimeter stucco, wood, metal, window and doorframes and concrete finishes, as applicable. Double bag and dispose of materials as Category I non-friable waste.
- K. With respect to removing roofing material, Principal Project Company shall comply with the following:
1. Seal any air intakes, operable windows, and skylights within 50 feet of the work area with 6-mil polyethylene sheeting secured in place over the opening. Weather conditions shall be dry and wind conditions less than 10 mph with dry. Establish a secured waste storage area where sealed bags of roofing material are stored during removal. Provide such areas for each different roof elevation or section. Line the storage areas with a layer of 6-mil polyethylene sheeting.
  2. Employees and authorized visitors at the work site during on-going work shall wear approved respirators and full body disposable protective clothing as described in "Personnel Protection" and are required to fully shower out when exiting the abatement zone.
  3. Set-up drop cloths on the ground under roofing removal area and abate the roofing materials using wet methods. Seal rooftop vents, windows, etc. with one layer of 6-mil polyethylene sheeting as a critical barrier. Bag or wrap waste in 2 layers of 6-mil polyethylene sheeting and lower to ground. Debris chutes must be sealed and negatively pressurized, if used.
  4. Comply with the following Cal/OSHA requirements:
    - a. Adequate wet ACM per 8 CCR 1529 Para. (g)(B)(2).
    - b. Provide continuous misting of cutting machines per 8 CCR 1529 Para. (g)(B)(3).
    - c. Use HEPA vacuums or dust collectors during power cutting per 8 CCR 1529 Para. (g)(B)(4).
    - d. Do not throw ACM roofing off the roof per 8 CCR 1529 Para. (g)(B)(5).
  5. For Disposal & Cleanup: HEPA vacuum the surrounding area following the abatement for final clearance. Dispose of all roofing debris as Category 1 non-friable asbestos waste.
  6. Allow for a 20 ft. minimum buffer zone between the roof removal activities and other demolition or renovation work. Dampen the roof surface with a fine spray of amended water before proceeding with removal. Keep roofing material damp throughout the removal process.
  7. Double bag roofing material in 6-mil labeled disposal bags and dispose of by methods described herein. Do not drop bags from the roof to the dumpster; transport bags without risk of their integrity utilizing the stairs or a lined waste chute. Where a lined waste chute is used, contain the opening to the dumpster with polyethylene sheeting and install a HEPA-filtration device to scrub the dumpster containment in the event of a bag rupture. Clean and seal the chutes overnight, as applicable.

8. HEPA vacuum and/or wet wipe the entire work site including adjacent roof area and removed areas following the roofing's abatement. The area may be sprayed with a light coat of encapsulant to lockdown all remaining asbestos fibers, except the skylights, as applicable.
  9. Provide a full decontamination system with shower for areas exceeding one hundred square feet (100 SF).
  10. Non-friable asbestos roofing material is considered non-hazardous and can be disposed of as non-hazardous asbestos waste. This can be transported and disposed of at a landfill-accepting Category I, non-friable ACM.
- L. With respect to removing window glazing putty, Principal Project Company shall:
1. Set up the lead hazard control regulated areas. Ensure that drop cloths extend sufficiently, about ten (10) ft. minimum, in all directions.
  2. Remove the windows intact to avoid disturbance to the window glazing putties. Burrito-wrap and dispose of windows as Category 1 non-friable waste. Where full removal intact is not feasible, close and seal windows and scrape putty utilizing drop cloths and wet methods. HEPA-vacuum the sills and surrounding area and use drop cloths, before final visual clearances.
- M. Window and Door Glazing Compounds
1. Remove windows and doors following abatement of other interior finishes and materials and wrap in a double layer of polyethylene sheeting, where feasible.
  2. Where complete removal and disposal of the frames is not feasible, scrape the glazing compound following installation of polyethylene drop cloths under each window or door.
  3. Scrape residual compounds from wood or metal frames, as applicable. Double bag and dispose of materials as Category I non-friable waste unless otherwise directed by the SAR group within the City Public Works Department or designee.
- N. With respect to removing fire rated doors, Principal Project Company shall:
1. Remove fire doors with 45-minute or greater fire rating intact, burrito-wrap in two (2) layers of six (6) mil fire-retardant polyethylene sheeting and dispose as friable asbestos waste.
- O. With respect to removing lead – containing ceramic tiles: Principal Project Company shall:
1. Set up the lead hazard control regulated areas. Seal vents, windows, etc., with one layer of six (6) mil polyethylene sheeting as a critical barrier. Post signs.
  2. Remove the ceramic tiles off from the substrate without bashing, cutting, grinding, or pulverizing the glaze, or include the ceramic tiles as part of the substrate demolition, if applicable. Bashing, cutting, grinding, or pulverizing glazed ceramic tiles is known to create significant airborne lead above the PEL.
  3. Manually demolish ceramic wall tiles using drop cloths, wet methods, and HEPA vacuums for dust control in compliance with Cal/OSHA regulation 8 CCR 1532.1. Do not use power tools or airline tools to demolish ceramic wall tiles.
  4. Avoid dry sweeping. Clean-up all work areas before leaving the site daily.

5. For tiles mounted to concrete, plaster or masonry substrates, isolate the room and establish negative pressurization of the work areas using HEPA-filtered negative pressure units and demolish the tiles using a pneumatic or electric chipper or jackhammer. Continuously mist the work area during chipping activities.
6. Dispose of debris as hazardous waste if waste characterization determines the waste to be hazardous. HEPA vacuum the fine debris and dust residues and dispose as hazardous waste.

P. With respect to removing lead sheeting, Principal Project Company shall:

1. Set up a negatively-pressurized containment for removal of the sheeting. Seal vents, windows, etc., with one layer of six (6) mil polyethylene sheeting as a critical barrier. Post signs.
2. Remove lead sheeting intact by unscrewing panels from substrate. Doors with sandwiched lead sheeting shall be removed by the pins/hardware without disturbance to the sheeting within the core.
3. If unbolting panels cannot be performed, and cutting of sheeting is required, non-powered tool shall be used. Lead sheeting is relatively soft and pliable, manual tearing / cutting can be easily done. Absolutely no torching or welding on the lead sheeting or in the vicinity of the lead sheeting, until after the zone has been tested, cleared and released as a non-lead containment work zone.
4. Use wet methods and HEPA vacuums for dust control in compliance with Cal/OSHA regulation 8 CCR 1532.1. Do not dry sweep any dust or debris generated by removal of panels.
5. Wrap sheeting to prevent it from scratching and leaving score marks on the floor. Lead sheeting waste shall be rolled up and wrapped with 10-mil plastic sheeting, labeled, before taken out of the containment. All scuff marks left by the lead sheeting on any surfaces must be thoroughly scrubbed and cleaned.
6. Characterize and dispose of sheeting and debris as potentially hazardous waste.
7. HEPA vacuum debris daily for all work areas before leaving the site.
8. Triple wash all surfaces inside the containment prior to final lead wipe sampling by the Environmental Consultant.

Q. With respect to removing painted plaster ceiling/wall/column lead paint removal, Principal Project Company shall:

1. Provide ladders, scaffolding, etc., to access and remove paint and or paint/substrate from all surfaces, as applicable. Ceilings shall be scraped first in each area.
2. Remove materials at applicable locations. Wet wipe, as required. Lightly dampen the work surface and mist the surrounding area continuously throughout the scraping process.
3. Scrape and nylon brush decorative or rough ceiling surfaces or trusses, as applicable, to remove the paint and or paint/substrate. Then, HEPA vacuum these surfaces.
4. After scraping, HEPA vacuum all surfaces to remove any remaining dust.

R. With respect to exterior paint removal, Principal Project Company shall:

1. Place drop cloths on the ground surrounding surfaces to catch any debris from scraping lead-based coatings, as applicable.
  2. Erect temporary protective covers over pedestrian walkways and at points of passage for persons or vehicles, which may remain operational during the course of the paint removal.
  3. Protect glass, metal trim and attachments, polished stone, or other sensitive materials and finishes from contact with chemical paint removers by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape. Apply masking agent to comply with the manufacturer's recommendations. Do not apply liquid masking agent to painted or porous surfaces, or masonry, as applicable.
- S. With respect to steel/metal/piping spot removal, Principal Project Company shall:
1. Remove paints on steel components scheduled for welding or torching using a chemical stripper, needle gun or other approved methods as outlined in the approved Principal Project Company's Hazardous Materials Management Plan (HMMP).
  2. Use drop cloths, polyethylene barriers, Hudson and airless sprayers and other methods as required for dust control.
  3. Characterize and dispose of paints, rags, etc., separately for possible disposal as a Hazardous Waste.
- T. With respect to removal of surface coatings with power tools, Principal Project Company shall:
1. Where mechanical removal of surface coatings constitutes a Level II activity, provide power tools, to the extent feasible, with local HEPA exhaust or dust collector systems to capture the aerosolized lead.
    - a. Removal with power blasting tools: For steel coated structures and as approved by the SAR group within the City Public Works Department or designee, power blasting tools may be used for removal of the lead-based paint or hazardous coating materials. To the extent a containment construction will be required to emissions. As part of the HMMP a detailed work plan including an enclosure system with dust collection systems and exhaust ventilation as needed shall be submitted and approved by the SAR group within the City Public Works Department prior to using this method.
    - b. Removal with power washing: For industrial facilities or where otherwise approved by the SAR group within the City Public Works Department or designee, power washing may be used for removal of the lead-based paint or contamination. Use of this method requires construction of containment, water collection system, a filtering system, and proper disposal of the wastewater. Adequately protect adjoining sensitive materials and equipment from damage or inclusion within the lead abatement waste. Deactivate electrical systems or adequately protect them prior to the power washing. A detailed work plan including an enclosure system shall be submitted and approved by the SAR group within the City Public Works Department prior to conduct such activities.
    - c. Removal with Sodium Bicarbonate Blasting: For areas requiring complete removal of all coating residues, use of sodium bicarbonate blasting may be used to supplement scraping or chemical stripping. Use of this method requires construction of containment and filtering system to segregate activities and waste from active work areas. Adequately protect adjoining sensitive materials and equipment from damage or inclusion within the lead abatement waste. Deactivate

electrical systems or adequately protect them prior to the water and sodium bicarbonate blasting. A detailed work plan including enclosure shall be submitted and approved by the SAR group within the City Public Works Department prior to such activities.

- U. With respect to removal of lead containing jacketed telephone cable, Principal Project Company shall comply with the following:
  - 1. Removal, handling and disposal of lead jacketed telephone cables that may be encountered during demolition activities shall be conducted in accordance with the Cal/OSHA's Construction Lead Standards 8 CCR 1532.1 and CDPH Regulation 17 CCR Section 3500 through 36100. This includes, isolation controls, personal protective procedures and dust controls.
  - 2. Prevent dust generated from trimming, cutting and otherwise manhandling lead sheathed telephone cables, dust from deconstructing and hauling off outmoded equipment and dust from soldier waste deposited on floors.
  - 3. Isolate and remove in its entirety each cable designated for removal. Use appropriate equipment and work practices to prevent lead releases. If at all feasible remove the cables using hand electrical shear tools with local HEPA exhaust or dust collector systems to capture the aerosolized lead. To further minimize lead dust during the cutting, apply isolation materials such as foam or "Vaseline" in the entire area of the cutting.
  - 4. Segregate, containerize, and characterize the electrical cables for waste disposal.
  
- V. With respect to removal of transite wall and ceiling board, Principal Project Company shall:
  - 1. Remove transite board using wet cleaning methods and HEPA vacuuming. Avoid unnecessary sawing and breakage. Take out as whole sheets, if possible. Remove debris remaining at the nails, screws, or other attachments to the studs and joists. Scrape residue remaining on studs or joists flush with the surface of these materials, if these materials are not scheduled for demolition. Continually mist the air with an airless sprayer or Hudson sprayer to lockdown suspended particulate.
  - 2. Clean up debris from pipe insulation, fireproofing, acoustical insulation, or other sources (as applicable), which may exist on the topside of the studs or within the wall or ceiling cavity.
  - 3. Clean up the area and dispose of the asbestos-containing waste. Panels may be wrapped in burlap or cardboard, prior to bagging, to protect against penetrating the disposal wrapping.
  
- W. With respect to removal of transite pipelines, ducts, breechings, or flues, Principal Project Company shall:
  - 1. Remove using full isolation procedures satisfying the requirements of Cal/OSHA Regulation 8 CCR 1529, Work Class II.
  - 2. Remove transite materials using wet cleaning methods and HEPA vacuuming. Avoid unnecessary sawing and breakage. Take out as whole lengths, if possible, cutting at the hanger supports and wrapping the separated sections in a double layer of polyethylene sheeting. Note that water penetration of this material is usually minimal.
  
- X. With respect to removal of underground transite piping or pipe insulation, Principal Project Company shall comply with the following:

1. Carefully excavate the areas identified for the underground utility or with potential to encounter underground piping. Using wet methods mist the excavated areas, as the pipe gets uncovered. To the extent feasible provide an enclosure for removal as required to control airborne fibers.
  2. Using wet methods and HEPA vacuuming techniques, remove pipe intact to the extent feasible. Cutting, abrading or breaking the pipe shall be prohibited. Immediately place pipe in polyethylene bag or wrap in polyethylene and label the waste.
  3. At the end of each work shift, all removed pipe shall be transferred to a closed receptacle.
  4. Clean up the regulated area and dispose of the asbestos-containing waste. Duct or flue edges may be wrapped in burlap or cardboard, prior to polyethylene sheeting, to protect against penetrating the disposal wrapping.
  5. Dispose of transite as Category 2 non-friable waste, double wrapping intact segments in six (6)-mil polyethylene sheeting.
- Y. With respect to removal of exterior vapor barrier or expansion joint, Principal Project Company shall:
1. Cordon area and set up drop cloths on the ground under the removal area and abate using wet methods. Seal vents, windows, etc. with one layer of six (6) mil polyethylene sheeting as a critical barrier. HEPA-vacuum surrounding area and drop cloths before final visual clearances.
- Z. With respect to removal of PCBs and mercury containing lamps, Principal Project Company shall comply with the following:
1. Disassemble all light fixtures to visually examine the ballasts; ballasts that are not labeled as non-PCB shall be collected and disposed of as PCB-waste. Collect fluorescent tubes for disposal / recycling as mercury containing wastes.
  2. Handling and Disposal of Lamps
    - a. Spent fluorescent and other mercury-containing lamps shall be considered a hazardous waste as per the California Department of Health Care Services.
    - b. Ship lamps to a commercial recycler (e.g., Mercury Technologies) where they shall be crushed and the mercury reclaimed.
    - c. Comply with DOT requirements for manifests, with evidence of proper disposal provided to the SAR group within the City Public Works Department, including a log of shipping dates and quantities.
    - d. Remove mercury fluorescent lights and load into secured cardboard boxes for shipment to prevent unnecessary breakage.
    - e. In the event of lamp breakage, clean-up broken glass and debris immediately, using a HEPA-filtered vacuum for final clean up.
- AA. With respect to loose debris cleanup, Principal Project Company shall comply with the following:
1. Construction operations may occasionally disturb loose and peeling paints outside the immediate work area through building vibration or other means. All such loose paint and debris shall be cleaned-up daily using a HEPA-filtration vacuum. Provide adequate protection to offset future disturbances by abating or otherwise sealing affected surfaces.

2. Clean-up background or construction-related dusts from demolition of lead-coated elements or other contaminant sources using wet methods and HEPA-filtered vacuums.
  3. Do not dry sweep.
- BB. With respect to stabilization of loose & peeling paints, Principal Project Company shall comply with the following:
1. Post notices, including CDPH, Cal/OSHA and EPA RR&P notices, as applicable, prior to start of work.
  2. Manually scrape and stabilize loose and peeling paints prior to demolition of painted substrates using drop cloths, wet methods, and HEPA vacuums for dust control in compliance with Cal/OSHA regulation 8 CCR 1532.11 and the EPA's RR&P rules. Avoid dry sweeping. Burning of paints, use of heat guns greater than 1,100 deg. F, and use of leaf blowers or compressed air for clean-up are prohibited.
  3. Use of mechanical equipment, such as sanders, grinders and needle guns without a HEPA-vacuum attached thereto are prohibited for sites with children under the age of 6 as occupants (per EPA's RR&P rules).
  4. Work areas shall be cleaned-up of lead hazards daily before leaving the site.
- CC. For mechanical sanding, Principal Project Company shall comply with the following:
1. Sanding is prohibited without written authorization from the SAR group within the City Public Works Department.
  2. If approved, work areas requiring mechanical sanding or stripping of painted surfaces with any lead content shall be fully contained with polyethylene dust barriers, establishing negative pressure of the zone, and using HEPA-filtered tools and other dust control procedures as outlined under 8 CCR 1532.1.
- DD. For prime or painted structural steel spot abatement, Principal Project Company shall comply with the following:
1. Manually scrape paints and primers at locations of new welded connections as shown in Contract Documents. Use an approved chemical stripper with "low odor" and scrape using manual, wet methods, drop cloths, visqueen barriers, and HEPA vacuums for dust control in compliance with Cal/OSHA regulation 8 CCR 1532.1, CDPH regulation 17 CCR Section 35001 through 36100 and the EPA's RR&P rules, as applicable.
  2. Avoid dry sweeping, burning of paints, use of heat guns greater than 1,100 deg. F, and use of leaf blowers or compressed air for clean-up. Use of mechanical equipment, such as sanders, grinders and needle guns without a HEPA-vacuum attached thereto are prohibited for this site per the EPA RR&P rules. Work areas shall be cleaned-up of lead hazards daily before leaving the site.
  3. Note that 8 CCR 1537(c) and SFPUC require stripping of any painting coating for a distance of at least 12-inches from the area of heat application (torching/welding, etc.), or workers shall be required to use supplied air respirators in accordance with 8 CCR 1532.1 or the provisions of 8 CCR 1536(b)(c). Dispose of stripper and contaminated drop cloths as hazardous waste.
  4. Ventilate the abatement zone as required by the stripper manufacturer. Workers shall wear combination organic (charcoal) and HEPA filter respirator cartridges, as necessary.

5. Note that despite the quality of abatement, some minor residues may remain on structural elements as well as paints and primers on inaccessible surfaces, which cannot be abated. During the welding phase, Principal Project Company shall operate "smog hogs" or localized exhaust units in the vicinity of welding work to prevent build-up of airborne lead contaminants within occupied and other construction areas. Localized exhaust units shall exhaust outdoors.
  6. For Disposal & Cleanup: Demolish and dispose of intact painted substrates as non-hazardous waste. Characterize and dispose of loose and peeling paint debris, chemical strippers, rags, etc. as potentially hazardous waste. Clean-up drop cloths and HEPA vacuum loose and peeling chips and debris daily for all work areas before leaving the site.
- EE. Principal Project Company shall comply with the following encapsulation procedures:
1. Do not start encapsulating work until receiving a notice to proceed from the SAR group within the City Public Works Department to apply encapsulant.
  2. Prepare and apply encapsulant in accordance with the manufacturer's specification, using airless spraying equipment. Because application by spraying could cause dissemination of residual fibers, encapsulant must be applied with as much caution and at as low a nozzle pressure as possible.
  3. Apply encapsulant in 2 coats with a tint to be approved by the SAR group within the City Public Works Department. Apply the first coat as a penetrating encapsulant, allowing it to properly dry. Then apply a second coat of bridging encapsulant.
  4. Apply penetrating type encapsulant to provide complete penetration of asbestos fireproofing surfaces exposed during the controlled renovation activities in accordance with manufacturer's recommendation. Apply encapsulant using airless spray equipment.
- FF. Principal Project Company shall comply with the following daily cleaning procedures:
1. Clean asbestos-containing debris and contaminated water from the work area daily using wet methods and HEPA vacuuming equipment. Place asbestos debris and water in bags, sealed and either stored or removed from the work area.
  2. Worker decontamination enclosure system; clean the clean room, shower, and equipment room daily or as required more frequently to maintain acceptable clean room perimeter air sample total fiber counts. Keep the clean room floor dry and free of any waste. Repair and replace the clean room flap whenever damaged or torn.
- GG. Principal Project Company shall comply with the following in bagging, drumming, and handling waste:
1. Protect all workers handling waste in full body protective clothing and at least a respirator approved by NIOSH for protection against asbestos. Workers transporting clean, sealed drums or other clean, sealed waste may handle waste with less protective clothing if approved by the SAR group within the City Public Works Department or its designee.
  2. Do not allow asbestos waste to dry out prior to sealing bags.
  3. Seal bags of asbestos-containing waste with tape within the work area. Seal bags with a goose neck fold: first twist bag and seal top opening with tape; fold remaining bag extension over the first tape enclosure and re-tape around top of bag there by double sealing the top opening. No free-flowing water shall be present at any time in the bag. If free-flowing water is present, Principal Project Company shall add absorbent into the bags to remedy the condition.

4. Wrap and seal waste treated as asbestos contaminated that cannot be contained in bags in 6-mil clear polyethylene plastic or other impermeable material approved by the SAR group within the City Public Works Department. Wrap objects that will tear, cut, or damage the integrity of the plastic in a protective material such as canvas or burlap to reduce the potential for damage to the plastic or other impermeable material.
5. Sealing Waste from Glove Bag with Cut-Out: Wrap sections of piping covered with ACM in a minimum of two layers of 6-mil polyethylene sheeting before removal from the work zone.
6. While in the work area, decontaminate bags and/or wrapped objects of any bulk debris by wet wiping. Utilizing the equipment decontamination enclosure system, pass the bags and/or wrapped objects into the washroom where they will be thoroughly decontaminated by wet sponging with amended water. Decontaminated bags will then be passed directly into the holding room where they will immediately be placed in a second clean bag and sealed with tape.
7. Wrap and seal decontaminated objects in a second layer of impermeable material.
8. Deposit bags with friable hazardous waste into clean sealable drums for transport. Seal filled drums. Mark drums with the label prescribed by the EPA, including the Generator I.D. Number or source location and the Waste Manifest Number.
9. Deposit bags into clean sealable dumpster for transport, except non-friable roofing which can be deposited directly into double-lined waste dumpsters for disposal at a landfill accepting Category I, non-friable ACM.
10. The SAR group within the City Public Works Department must be notified prior to removing materials from the work area and prior to loading waste into dumpsters or other transport containers for removal from the site. At least 24 hours of advance written notification must be given.

**END OF SECTION**

## **SECTION 02 81 10 - ENVIRONMENTAL MANAGEMENT OF EXCAVATED MATERIALS**

### **PART 1 - GENERAL**

#### **1.1 DESCRIPTION**

- A. Up to 80% of the surplus soils to be excavated, transported and disposed may be classified as a Hazardous Waste and/or contaminated material. The Work will involve working environments that may be hazardous, contaminated, or non-hazardous to activities associated with the excavation, handling, transportation, and disposal of all excavated materials and other wastes in the Project Site with emphasis to Hazardous Materials.
- B. Serpentine, serpentinite, or other ultramafic rocks and soils containing naturally occurring asbestos (NOA) will be encountered on the Project Site.
- C. Such hazardous, contaminated, and non-hazardous environments include, and are not limited to Hazardous Materials and non-Hazardous Materials, soils, groundwater, heavy metals, petroleum hydrocarbons, polynuclear aromatic hydrocarbons, organic compounds, serpentine rock and ultramafic material (which may contain natural occurring asbestos - NOA), lead-based paint materials, sewage, sludge, debris, grit, sewer gases, bacterial/biological contamination, rail road ties, oxygen deficiency, and confined spaces.
- D. If Hazardous Materials are discovered, immediately notify the SAR group within City Public Works Department and the City's Authorized Representative both orally and in writing.
- E. Provide employees with all levels of personal protective equipment (PPE), including personal air monitoring if required. Principal Project Company shall have taken into account the productivity losses, if any, due to the use of respirators and personal protective equipment.
- F. Do not use the Project Site as a storage facility for work being performed at another site.
- G. Lead Hazards: All Work that affects any level of lead will at a minimum be performed under the Cal/OSHA Lead in Construction Standard 8 CCR 1532.1 as well as all federal, State, and local regulations.
- H. Hazardous Waste and non-Hazardous Waste shall only be disposed at permitted California landfills (22 CCR 66262), equivalent out-of-state landfills (40 CFR 262), permitted recycling facilities, and at other projects as approved by the SAR group within City Public Works Department.
- I. Any screening or crushing operations of excavated materials cannot proceed without the appropriate BAAQMD and Cal-EPA/DTSC permits.
- J. A Site Mitigation Plan was prepared and approved by the San Francisco Department of Public Health, the requirements of which are included in this Section 02 81 10.

#### **1.2 RELATED SECTIONS**

- A. Section 01 35 43 Environmental Procedures
- B. Section 01 35 50 Additional Environmental Procedures

#### **1.3 SUBMITTALS**

- A. Principal Project Company shall submit the documents listed below no later than ten Days before start of Work at the Project Site or NTP2, whichever is earlier, before any soil disturbing activity may begin.
- B. Principal Project Company shall submit the following to the SAR group within City Public Works Department as separate submittals:
  - 1. Name environmental consultant and the accredited environmental laboratory, if used.
  - 2. Pre-Excavation Soil Profiling Sampling Plan draft and final version in accordance with Part 1.4 herein.
  - 3. An Environmental Site Assessment (Phase II) draft and final report in accordance with Part 1.4 herein.
  - 4. Site Mitigation Completion Report (SMCR) as requested by San Francisco Department of Public Health.
  - 5. Waste profile application package on each waste stream planned for disposing the excavated soil. Prepare and submit waste profile application to each proposed disposal facilities for acceptance. The formal waste profile application will also include, if any, additional information (such as slurry additive applied as part of the construction) shall be included in the formal waste profile application.
  - 6. Waste Profile # (s) from the permitted landfills or the permitted disposal & recycling facilities that will be used.
  - 7. Workers Mandatory Environmental Training Records in accordance with Part 1.7 herein, as requested by the City as Regulator.
  - 8. Transporter's current Class 1 Certificate of Compliance from the California Highway Patrol and Hazardous Substance Removal Certification in accordance with Part 1.9 herein, as warranted.
  - 9. Copy of the Non-Hazardous Waste form for and subsequent copies attached to the monthly Soil Disposal Spreadsheet in accordance with Part 1.10 herein.
  - 10. Hazardous Waste Manifest in accordance with Part 1.11 herein, as warranted.
  - 11. The original source of where the import soils are coming from, the name of the laboratory used to analyze the soils, and the date of chemical analysis, and the analytical test results, and frequency of the analytical testing in accordance with Part 3.3 herein.
  - 12. Monthly Import Fill Spreadsheet in accordance with Part 3.3 herein.
  - 13. Cal/OSHA asbestos Competent Person training records as pertaining to requirements specified in the Cal/OSHA standard 8 CCR § 1529, and when Serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) is present.
  - 14. Cal/OSHA asbestos worker training records as pertaining to requirements specified in the Cal/OSHA standard 8 CCR § 1529, and when Serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) is present.

**1.4 CLASSIFICATION AND MANAGEMENT OF EXCAVATED MATERIALS**

- A. The pre-excavation profiling shall be done so as to classify the excavated soils for a "load and go" disposal to a permitted California landfill or equivalent out of State landfill for Class I, II & III disposal, or permitted disposal & recycling facilities.

- B. An intermediate soil staging and loading facility is not provided as part of this Agreement. Principal Project Company may use its own or a subcontracted intermediate soil staging and loading facility. Such a facility shall be permitted in accordance with applicable Laws and meet the definitions of the California Code of Regulations (CCR) Title 22, 66260.10 for "Individual generation site", "Onsite", "Onsite facility".
- C. Except as otherwise stated in the Contract Documents, Principal Project Company shall perform or cause to be performed excavation, loading, handling, transportation, and disposal of all surplus waste excavated soils and sediments from dewatering activities, meeting requirements of a certified and permitted California landfill or an equivalent out-of-state landfill. All such disposal activities shall require the approval of the SAR group within City Public Works Department prior to actual loading and disposal.
- D. Conditions for acceptance at various local landfills/waste disposal facilities include, filling out of a waste profile, that the surplus waste excavated soil hauled to the landfill will have greater than 50 percent solids, and cannot have any free liquids. Principal Project Company is responsible for meeting landfill requirements for disposal.
- E. Principal Project Company shall maximize reuse of excavated soils. Excavated soils can be reused anywhere within the Project Site. If the soils from this area cannot be reused, such surplus waste excavated soils shall be disposed at a certified and permitted California landfill for Class I, or Class II, or Class III, disposal or an equivalent out-of-state landfill. Acceptable landfills/waste disposal facilities for California Class I, II and III wastes are:
1. Republic Services, <http://www.republicservices.com/Corporate/Business/WasteRecycling/Facilities/landfills.a.spx>
  2. Waste Management Inc, <https://www.wm.com/find-a-facility.jsp>
  3. Clean Harbors Buttonwillow LLC, [www.cleanharbors.com](http://www.cleanharbors.com)
- F. Except for Article 1.4 herein, Principal Project Company shall not conduct any environmental or Hazardous Materials sampling or analysis without prior permission from the SAR group within City Public Works Department. If approved, the environmental or Hazardous Materials sampling shall be done in the presence of a SAR group within City Public Works Department. This does not include the Principle Project Company's obligation for any personnel air monitoring.
- G. Principal Project Company shall inform the SAR group within City Public Works Department in writing and obtain City's approval prior to any sale, supply, or offer to sell excavated material. Comply with Bay Area Air Quality Management District's (BAAQMD's) Regulation 11, Rule 14 for asbestos-containing serpentine. Additional information may be found at <http://www.baaqmd.gov/~media/dotgov/files/rules/reg-11-rule-14-asbestoscontaining-serpentine/documents/rg1114.pdf?la=en>, the California Air Resource Board Advisory #161 (<https://ww2.arb.ca.gov/enforcement-advisory-161-serpentine-rock>), and Title 17, Section 93106 of the California Code of Regulation (CCR). Principal Project Company shall perform all the engineering and chemical testing as required by the SAR group within City Public Works Department and applicable Laws and policies.
- H. Cal/OSHA regulations are triggered when asbestos is present in any amount. Principal Project Company shall fulfill the obligations under CCR Title 8, Section 1529. The regulation requires monitoring to determine exposure levels, wet methods, respirators and protective clothing, controlled access to the work area, and similar precautions associated with asbestos work regardless of the origin of the asbestos. Use of a competent person to oversee the work may also be necessary. Utilize an experienced certified industrial hygienist (CIH) and a professional geologist (PG) to assist it with this work.

- I. Asphalt, concrete, aggregate base, vegetation, debris, wood, obstructions, and other organic, unsound or deleterious matter shall be excavated separately from the soil layer, and shall not be reused as backfill. The removal, management, transportation, and disposal of asphalt, concrete, aggregate base, vegetation, debris, wood, obstructions, and other organic, unsound, or deleterious matter shall be incidental to its respective bid items.
- J. Soils of different waste disposal classification shall be segregated when excavated, managed, transported, and disposed separately with no mixing of the different types of wastes.
- K. When performing the Work, Principal Project Company shall take into account productivity losses, if any, due to but not limited to encountering and managing Hazardous Materials or non-hazardous materials, the use of respirators and personal protective equipment. The City as Regulator reserves the option and right, at any time, to use its own forces to excavate, remediate, bioremediate, haul, recycle, or dispose of both, Hazardous Materials and non-Hazardous Materials at its own facilities, State-approved facilities, contracted facilities or contracted out-of-state facilities.

## 1.5 DEFINITIONS

- A. Waste: Discarded material of any form as defined by the Code of Federal Regulations 40 CFR 261.2 (<http://www.access.gpo.gov/nara/cfr>) and the California Code of Regulations 22 CCR 66261.2 (<http://ccr.oal.ca.gov>).
- B. Hazardous Waste: This may include excavated material, friable asbestos containing material (ACM) that is not naturally occurring in rock and soil, loose and peeling lead-based paints, and other material that is regulated by and requires management, handling, transport, treatment, storage, and disposal according to the requirements of the Federal Resource conservation Recovery Act (RCRA) and associated regulation 42 U.S.C. 6901 et seq. (<https://www.epa.gov/laws-regulations/summary-resource-conservation-and-recovery-act>) and 40 CFR Part 260 et seq., or the California Hazardous Waste Control Law (<https://www.epa.gov/rcra/resource-conservation-and-recovery-act-rcra-regulations>) and associated regulations (Health and Safety Code 25000 et seq. ([https://leginfo.legislature.ca.gov/faces/codes\\_displayexpandedbranch.xhtml?tocCode=HSC&division=20.&title=&part=&chapter=&article=](https://leginfo.legislature.ca.gov/faces/codes_displayexpandedbranch.xhtml?tocCode=HSC&division=20.&title=&part=&chapter=&article=) and 22 CCR 66260 et seq.).
- C. Management of excavated materials or “management” means transportation, transfer, recycling, recovery, disposal, handling, processing, storage, and treatment of excavated materials in accordance with applicable Laws.
- D. Soil: earth material composing the superficial geologic strata (material overlying bedrock), consisting of clay, silt, sand, or gravel size particles as classified by the U.S. Soil Conservation Service. Soil does not include asphalt, concrete, aggregate base, vegetation, debris, wood, obstructions, and other organic, unsound, or deleterious matter.
- E. Project Site Mitigation Plan (Project SMP): In accordance with San Francisco Health Code Article 22A and 22B, a Project SMP was approved by the San Francisco Department of Public Health on October 1, 2024, which contains mandatory requirements for managing all soil excavation activities to protect the environment and public health . .
- F. Excavated material includes all soils (fill, alluvium, bedrock), and other materials generated in the course of the Work, which shall be excavated, handled, or disposed under this Agreement.
- G. Waste excavated soil is excavated soil that is a waste and cannot be reused within the Project Site in accordance with reuse criteria of this Section. It is surplus and shall be managed, transported, and disposed of as part of this Agreement. Waste excavated soil does not include

asphalt, concrete, vegetation, wood, debris, obstructions, and other organic, unsound, or deleterious matter.

- H. Naturally Occurring Asbestos (NOA): NOA in the City and County of San Francisco is typically associated with ultramafic, metamorphic or metamorphosed rocks within the Franciscan mélange, including serpentinite, greenstone, and blueschist. There are six regulated naturally occurring asbestos minerals: chrysotile, crocidolite (asbestiform riebeckite), amosite (grunerite-cummingtonite), tremolite, actinolite, and anthophyllite (CGS 2002). The six asbestos minerals are divided into two distinct mineral groups; serpentine minerals (chrysotile), and amphibole minerals, which include the remaining five above-mentioned minerals. These asbestos minerals are classified as known human cancer-causing substances by local, state, and federal health agencies (DTSC 2004), and regulated by name.
- I. The following soil classifications with corresponding requirements are established solely for the purpose of payment for the handling, transportation and disposal of the excavated materials determined to be a waste:
  - 1. California Class I (non-RCRA) hazardous waste: is waste excavated material that is classified as California (non-RCRA) hazardous waste, requires disposal at a California Class I disposal facility or a similarly permitted out-of-state facility and requires transport by a registered hazardous waste transporter.
  - 2. California Class II and Class III designated waste (Class II and Class III): is non-hazardous waste, and is not a California or Federal hazardous waste. It requires disposal at a California Class II or Class III disposal facility or at a similarly permitted out-of-state facility without the need of a registered hazardous waste transporter.
  - 3. Asbestos containing rock and soil where the asbestos is naturally occurring and not associated with cross contamination by building materials may be classified as California Class II waste. Principal Project Company shall contact the landfill it identifies to receive waste to assure that asbestos containing naturally occurring materials meet the acceptance criteria of the California Class II landfill.

## **1.6 WORKER'S MANDATORY ENVIRONMENTAL TRAINING**

- A. Principal Project Company, and its DB Contractor, shall:
  - 1. Provide sufficient numbers of properly trained personnel who may come in contact with, may be exposed to, disturb, operate equipment in, or otherwise excavate, handle, transport and dispose hazardous or contaminated excavated materials, asbestos, naturally occurring asbestos (NOA), and silica.
  - 2. Ensure workers have the environmental training, listed below, and training certifications and personal protective equipment (PPE), as required by applicable Laws. Submit certifications or proof of such training when requested by the SAR group within City Public Works Department.
  - 3. Hire an experienced Certified Industrial Hygienist (CIH) and a Registered Geologist (RG) to assist it with the following:
    - a. HAZWOPER: This training is required of Principle Project Company and DB Contractor's employees and Subcontractors who may come in contact with, may be exposed to, disturb, operate equipment in, or otherwise excavate, handle, transport and dispose hazardous or contaminated excavated materials, asbestos, naturally occurring asbestos (NOA), and silica. Employee(s) shall possess a current 40-hour Hazardous Waste Operation and Emergency Response ("HAZWOPER") training and certification and the associated 8-hour HAZWOPER

refresher training (in accordance with Sections 5192 and 5144 of Title 8, CCR and Title 29 CFR, Sections 1910.120 and 1910.134), and shall be certified to wear appropriate personal protective equipment and respirators.

- b. Cal/OSHA Asbestos Class II asbestos operations and Asbestos Competent Person (ACP): Principal Project Company shall meet its obligations under CCR Title 8, Section 1529 when Serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) is present.
    - 1) Principal Project Company and its DB Contractor shall have its workers, trades people and Asbestos Competent Person that will come in contact with serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) be trained for the Class II work activity level as per the Cal/OSHA standard 8 CCR § 1529.
    - 2) Principal Project Company shall have a Cal/OSHA Asbestos Competent Person as it pertains to requirements specified in the Cal/OSHA standard 8 CCR § 1529, and when serpentine, serpentinite, or other ultramafic rocks containing Naturally Occurring Asbestos (NOA) is present.
  - c. SILICA: Principal Project Company shall meet its obligations under the Respirable Crystalline Silica standard for construction, found in the California Code of Regulations, Title 8, Sections 1530.1, 1532.3, and 5155; and OSHA Regulation 29 CFR 1926.1153.
  - d. Health and Safety training.
  - e. Lead awareness training (for all trades who will come in contact and disturb lead containing paints as per Cal/OSHA 1532.1 Lead in Construction standard). If personal exposures to the workers exceed the 8-hr Permissible Exposure Level (PEL) of 50 micrograms/cubic meter, such worker(s) must have received training as a CDPH Certified Lead Worker (as per 17 CCR Division 1, Chapter 8).
  - f. Dust Control and Mitigation awareness training to enable Principal Project Company's personnel to comply with Sections 01 35 49 Minimum Environmental Procedures and 01 35 50 Additional Environmental Procedures.
  - g. Medical examination and blood tests (as warranted).
  - h. Respiratory protection (including current respirator fit test records).
  - i. Other training as necessary and pertaining to the work being conducted.
- B. Only qualified persons shall engage in Hazardous Materials-related work. Principal Project Company and DB Contractor personnel, who come in contact with, are exposed to, disturb, operate equipment in, or otherwise handle hazardous or contaminated materials, or demolition debris shall have appropriate hazards communication, environmental training and medical monitoring.
  - C. The City will not grant extensions of time or increases in payment for costs associated with Principal Project Company's productivity losses, inability to provide properly trained personnel, costs of training Principal Project Company's workers, or hiring of required personnel.
  - D. It is Principal Project Company's responsibility and liability to ensure that its workers and contractor have the proper training, personal protective equipment (PPE), and respiratory protection.

- E. Principal Project Company and its DB Contractor, not the City, is responsible for the health and safety, training, personal protective equipment (PPE), and monitoring and protection from exposure risks of its employees, as per federal, state and local statutes, laws and regulations.
- F. Principal Project Company is obligated to conduct any required personal air monitoring of its workers, at its own expense, in accordance with Section 01 35 45 Health and Safety Criteria.

#### **1.7 REGULATORY INDEMNIFICATION**

- A. Principal Project Company is specifically alerted to, and shall familiarize itself and its DB Contractor to, the liability statutes of:
  - 1. The Comprehensive Environmental Responses, Compensation, and Liability Act (CERCLA) of 1980 found in 42 USC, Section 9601 et seq.
  - 2. The Superfund Amendments and Re-authorization Act (SARA) of 1986 found in 42 USC, Section 9601 et seq.
  - 3. The California Hazardous Substance Account Act (HSAA) of 1981 found in California Health and Safety Code, Section 25300 et seq.
  - 4. California Health and Safety Code, Division 20, Regulations and CCR 22 Section 6600 et. seq.
  - 5. Cal/OSHA Lead in Construction Standard, Title 8, CCR, Section 1532.1.
  - 6. BAAQMD Regulation 6 for Particulate Matter and Visible Emissions (<http://www.baaqmd.gov/~media/files/planning-and-research/rules-and-regs/workshops/2017/rg0601-pdf.pdf?la=en>) and Regulation 11 for Hazardous Pollutants (<http://www.baaqmd.gov/regs/rulereg.htm>).
  - 7. The Final Regulation Order of the California Code of Regulations (CCR) Title 17, Public Health, Section 93105, on Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations ([http://www.baaqmd.gov/~media/Files/Compliance%20and%20Enforcement/Asbestos/final\\_reg\\_order.ashx](http://www.baaqmd.gov/~media/Files/Compliance%20and%20Enforcement/Asbestos/final_reg_order.ashx)).
  - 8. The California Air Resources Board (CARB) Asbestos Airborne Toxic Control Measure for Surfacing Applications.
  - 9. The San Francisco Building Code Section 106.3.2.6
  - 10. San Francisco Health Code, Article 22B - Construction Dust Control Requirements.
  - 11. The DPW Dust Control Order 171,378.
- B. Principal Project Company shall be responsible for all liability and costs necessary to prevent its own or DB Contractor's operations from violating federal, State, or local statutes, laws, regulations, and policies.

#### **1.8 REQUIREMENTS FOR THE TRANSPORTER**

- A. As warranted, Principal Project Company shall ensure that its drivers have in their possession, during the hauling of material and soil, all applicable State and local vehicle insurance requirements, valid driver's license, and vehicle registration and licensing. A current Class 1 Certificate of Compliance from the California Highway Patrol shall be affixed to each vehicle.

- B. All hazardous materials/waste haulers shall possess a Hazardous Substance Removal Certification granted by the State of California, Contractors State License Board (1-800-321-2752 or <http://www.cslb.ca.gov>), and all other required certifications and insurance.
- C. Haul trucks carrying excavated material shall be loaded so that the material does not extend above the walls of the truck bed, and there is no leakage from any vehicle. All truckloads shall be covered.
- D. All truckloads containing Naturally Occurring Asbestos (NOA) and Serpentine require both covering the load as well as lining the underneath of the truck bed ("burrito wrap") with 10mil HDPE. This is required regardless if the material is wet, hazardous, or non-hazardous.
- E. Principal Project Company shall be responsible for cleaning up excavated material spill, which occurs during loading, handling, and transportation.
- F. Preparation for shipment: Marking, labeling, placards, and packaging prior to transport shall be in accordance with all regulations and shall be the responsibility of Principal Project Company.

**1.9 USE OF NON-HAZARDOUS WASTE MANIFEST FOR CLASS II MATERIAL OR LESSER**

- A. For transportation and disposal of the non-Hazardous Waste, Principal Project Company shall initiate and fill out a non-Hazardous Waste profile form with the Class II/III landfill of its choosing. Then, submit this waste profile form to the SAR group within City Public Works Department for its approval & signature. Next, Principal Project Company shall prepare a non-hazardous waste manifest form from the landfill. The non-hazardous waste manifest form shall be completed for each vehicle carrying excavated material classified as California Class II and Class III designated waste, or of a lesser waste classification. Principal Project Company shall submit the non-hazardous waste manifest form to the SAR group within City Public Works Department for the Generator's signature at least 72 hours in advance of the day of the off-haul with an estimate of the number of loads scheduled for off-haul. The non-hazardous waste manifest form shall contain the following information before providing the final copy to the SAR group within City Public Works Department to sign:
  1. Name, address and phone number of the Generator, Project name, and Specification Section number.
  2. Principal Project Company's billing information
  3. The soil profile approval number and description of the waste.
  4. Name, address and phone number of the transport company.
  5. The name, address, and telephone number of the receiving facility i.e., disposal facility.
- B. The City will not be responsible for off haul delays if Principal Project Company does not notify the SAR group within City Public Works Department in a timely manner to sign the non-hazardous waste manifest forms.
- C. On a monthly basis, Principal Project Company shall provide the SAR group within City Public Works Department with a copy of each completed non-hazardous waste manifest Form (with the landfills signature) and its corresponding certified weight ticket.

**1.10 HAZARDOUS WASTE MANIFESTING PROCEDURES FOR CLASS I MATERIAL**

- A. As warranted, Principal Project Company shall furnish all labor, materials, equipment, and incidentals required to transport those materials identified as Hazardous Waste for the purpose of disposal.

- B. Principal Project Company shall comply with all applicable regulatory requirements listed as well as other applicable federal, State, or local laws, codes, and ordinances, which govern or regulate transportation of wastes (including but not limited to DOT-HM 181 in accordance with 49 CFR 172).
- C. All material classified as hazardous waste (Federal Class1 RCRA and California Class1 non-RCRA wastes only) shall be hauled off using a licensed hazardous waste transporter and the uniform hazardous waste manifest form (DTSC Form 8022A and/or EPA Form 8700-22 a.k.a. the manifest).
- D. Preparation and handling of waste manifests:
  - 1. For transportation and disposal of the Hazardous Waste, Principal Project Company shall initiate and fill out a Hazardous Waste profile form with the Class I landfill of its choosing. Then, it shall submit this Hazardous Waste profile form to the SAR group within City Public Works Department for its approval and signature. Next, Principal Project Company shall provide and prepare the Hazardous Waste manifest for each shipment of Hazardous Wastes from the Project Site. Principal Project Company is hereby notified that Hazardous Waste manifest, waste profiling, and landfill service agreements have to be prepared and have to be approved by the landfill in advance of the off haul. Principal Project Company shall consult with the SAR group within City Public Works Department for local requirements in filling out the forms.
    - a. The manifest shall describe the contents of each truck carrying materials to the waste disposal site, including the weight of the waste materials. Weight, not volume, shall be used to measure waste quantities.
    - b. The SAR group within City Public Works Department will provide a Hazardous Waste generator identification number for use on the manifest. Principal Project Company shall provide the State Transporter identification number and telephone number.
    - c. The licensed transporter shall also sign and date the manifest indicating that it has accepted the load described in the manifest on that particular day.
    - d. Only a City employee (and not Principal Project Company) from the SAR group within City Public Works Department will sign the manifest for the "generator" of the waste.
- E. Principal Project Company shall notify the SAR group within City Public Works Department 72 hours prior to off-haul of all excavated material. If the manifest and other forms above are to be signed by the SAR group within City Public Works Department during periods other than the hours stipulated above, Principal Project Company shall give an additional 72-hour advance notice to the SAR group within City Public Works Department.
- F. The SAR group within City Public Works Department will sign and keep the Generator's copy and give the remaining copies to the licensed transporter.
- G. The licensed transporter shall carry the hazardous waste manifest with each truckload using the traffic control approved routes for off haul
- H. Within 2 days of its return, Principal Project Company shall provide the SAR group within City Public Works Department with the completed waste manifest. The completed waste manifest shall be certified by the receiver of the waste shipment, confirming that the shipment was received at the waste treatment or disposal facility designated in Principal Project Company's bid, and certifying the weight of the shipment.

- I. Should any waste manifest not be returned within 35 days of shipment, Principal Project Company shall initiate follow-up, shall document such follow-up effort in writing with an Exception Report in accordance with 40 CFR 262.42 and/or 22 CFR 66262.42, and shall provide a copy to the SAR group within City Public Works Department.
- J. Mandatory Information for the Manifest
  1. Manifest Item 1: Generator's US EPA ID Number for Project. (Will be provided by the City after NTP as deemed necessary)
  2. Manifest Item 3: Emergency response Phone: # 24 hours line to be provided by Principal Project Company
  3. Manifest Item 5:
 

Generator's Name and Mailing Address:  
SFDPH  
Municipal Hazardous Waste Program  
49 South Van Ness Avenue, Suite 600  
San Francisco, Ca 94103
  4. Generator's Site Address:  
Name of the project
  5. Manifest Item 14: The following information is mandatory:
    - a. Contract JO # & Name of Project TBD
    - b. Project Manager: TBD
    - c. Project Manager Phone Number #:
    - d. Profile # \_\_\_\_\_ (Defined when manifest is generated. To be obtained and provided by Principal Project Company)
  6. The City & County of San Francisco applies for an exemption from the BOE Hazardous Waste Generator fees in accordance with H&SC 25174.7, 25174.1; 25205.5, and 25345. (1) Hazardous wastes which result when a government agency, or its contractor, removes or remedies a release of Hazardous Waste in the state caused by another person, and in an area from beneath a public street and originated from earthquake fill."

#### **1.11 UNDERGROUND TANK REMOVAL PROCEDURES**

- A. Principal Project Company is alerted to the fact that underground structures and tanks may be encountered during excavation. In the event that an underground storage tank, pipes, and associated fixtures are encountered, Principal Project Company shall immediately suspend the work in the immediate area and notify the SAR group within City Public Works Department as well as the San Francisco Department of Public Health.
- B. Principal Project Company shall be responsible for removing and disposing the underground storage tank, pipes, and associated piping in the excavation area according to applicable laws and regulations including:
  1. California Health and Safety Code (H&SC), Division 20, Chapter 6.9 (Section 25280 et.seq.)
  2. California Code of Regulations (CCR), Title 23, Division 3, Chapter 16 (Section 2610 et.seq.)

3. California State Water Resources Control Board (SWRCB), Leaking Underground Fuel Tank (LUFT) Manual.
  4. City & County of San Francisco, Department of Public Health, Underground Storage Tank Removal Regulations. Information available at but not limited to <https://www.sfdph.org/dph/EH/HMUPA/UST.asp>
- C. Principal Project Company shall obtain all permits, excavate, sample, analyze and prepare all reports as required by the San Francisco Health Code.
  - D. Principal Project Company shall prepare an Underground Storage Tank (UST) Closure Plan in compliance with Article 21 of the San Francisco Health Code, if UST's will be removed. Principal Project Company shall only remove the underground tanks, pipes, and related appurtenances only in the presence of an inspector from the City's Department of Public Health, the City's Fire Department, and the City's Authorized Representative.
  - E. Principal Project Company shall furnish documentation of the removal of an underground tank.

#### **1.12 DISPOSAL OF RAILROAD TIES AND TREATED WOOD WASTE**

- A. Railroad ties and wood treated with preservatives (e.g. utility poles, piers, pilings, posts, pressure treated lumber, etc), such as creosote, and/or pentachlorophenol, and/or Copper Napthenate, Zinc Napthenate, and/or Copper, Chromium, Arsenate (CCA), and/or Ammonical Chromium, Zinc, and Arsenate (ACZA) (that are not otherwise recycled by Principal Project Company) shall be transported and disposed of at a California Class 2 (non-hazardous) landfill.
- B. For wood treated with chemical preservatives such as Chromate Copper Arsenate (CCA) treated wood: Principal Project Company shall comply with the Federal Insecticide, Fungicide, Rodenticide Act (FIFRA) and by the California Department of Pesticide Regulation (DPR) and Department of Toxic Substances Controls (DTSC) Regulations or for the treated wood waste as per the Health and Safety Code (HSC) 25150.7 and 25150.
- C. Principal Project Company shall fill out a separate waste profile with the landfill for such materials.
- D. The transportation and disposal of the railroad ties and treated wood waste shall be paid as a change order.

#### **1.13 POLLUTION INSURANCE**

- A. All Work that involves the management, handling, transportation, and disposal of hazardous and contaminated (non-hazardous) materials shall be performed either by Principal Project Company or a properly licensed Principal Project Company, who shall furnish evidence of Principal Project Company's Environmental Pollution Liability Insurance.

### **PART 2 - PRODUCTS (NOT USED)**

### **PART 3 - EXECUTION**

#### **3.1 SITE MITIGATION PLAN REQUIREMENTS**

- A. Principal Project Company shall ensure that all activities associated with soil excavation comply with the requirements of the approved Project SMP (see definitions above), which include but are not limited to:
  1. Environmental controls, which include:

- a. Health and safety requirements;
  - b. Site control and exclusion zones requirements
  - c. Project signage requirements
  - d. Noise control requirements
  - e. Equipment decontamination requirements
2. Soil management, which includes:
    - a. Soil field screening requirements
    - b. Soil containment requirements
    - c. Dust and fugitive emissions control requirements
  3. Excavation activities, which include:
    - a. Bedrock asbestos requirements
    - b. Excavation dewatering requirement
  4. Stormwater protection requirements
  5. Backfilling and restoration requirements
  6. Waste management and disposal, which includes:
    - a. Areas of potential concern requirements
    - b. Soil waste management requirements
  7. Asphalt and concrete debris waste management requirements
  8. Groundwater waste management requirements
  9. Recordkeeping requirements
- B. Upon completed implementation of the Project SMP, Principal Project Company shall submit the following documents to the SAR group within City Public Works Department as well as the City Public Health Department:
1. Verification sampling results from the areas of soil vapor samples SVP-4I and SVP-7S, that demonstrate either tetrachloroethene (PCE) is not present in sub-slab vapor at concentrations that pose a vapor intrusion concern following completion of the new slab, or PCE is not present in indoor air at concentrations that pose an unacceptable health risk following completion of the new slab and building envelope.
  2. A Site Mitigation Completion Report (SMCR) which documents implementation of the SMP, including the dust and fugitive emissions control plan contained therein, including any additional sampling, soil disposal, and post-construction verification sampling activities.
- C. In the event Project SMP requirements differ from the remainder of these Part 3 Sections 3.2 – 3.6, the Project SMP requirements shall supersede.

### **3.2 TEMPORARY STOCKPILING OF EXCAVATED MATERIAL AND IMPORT MATERIAL**

- A. Principal Project Company shall comply with Article 2.4: Excavation in the Public-Right of-Way and specifically Article 2.4.53(c) Storage of Materials and Equipment.
- B. If feasible and in the event that the SAR group within City Public Works Department permits Principal Project Company to temporarily stockpile excavated and import material along the project alignment, the following conditions shall apply (including those in Sections 01 35 43 Environmental Procedures and 01 35 50 Additional Environmental Procedures):
  - 1. Material shall be stockpiled at a location approved by the City. The volume of the stockpile will be limited within the discretion of the City.
  - 2. Stockpiled materials shall not be stored for more than 48 hours.
  - 3. The City retains the right to suspend the use of temporary stockpiling in the event of negative public perception, aesthetic concerns, and regulatory concerns. In such an event, Principal Project Company is directed to remove the stockpile within 24 hours.
  - 4. After a stockpile has been removed, Principal Project Company shall wet sweep and vacuum the area, street, and sidewalk to remove residual soil, restore the site to its original condition.
  - 5. Stockpiles of site backfill soils shall be tarped using a different colored tarp from that of import soils.
  - 6. Stockpiles must be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile, and securely tarped & braced (weighted or tied down).
  - 7. Stockpile Maintenance requirements in Section 01 35 43 Environmental Procedures and Section 01 35 50 Additional Environmental Procedures.
- C. All costs associated with the temporary stockpiling of soils shall be borne by Principal Project Company. Such related incidental costs include, but are not limited to dust control, vacuum and wet sweeping, covering of stockpiles, multiple handling and transportation, multiple staging, work re-sequencing or rescheduling, time loss and standby time due to the duration of storage, and complying with Federal, State, and local requirements.

### **3.3 REUSE OF EXCAVATED SOILS AS BACKFILL**

- A. For backfill work: Principal Project Company shall maximize the reuse of native soils from the excavation, unless directed otherwise by the SAR group within City Public Works Department. In such a case, the following conditions shall apply:
- B. The reuse of native soils as backfill material shall meet the requirements of Part 7 – Excavation, Backfill and Embankment of the Standard Specifications and Plans, Department of Public Works, City and County of San Francisco. The Standard Specifications and Standard Plans are accessible online at <http://www.sfpublicworks.org/services/standards-specifications-and-plans>
  - 1. Native soils to be reused must not contain asphalt, concrete, bentonite, bay mud, clay, bricks, cobblestones, rocks, rubble, scrap metal, railroad tracks and ties, debris, contaminated soils, vegetation, wood obstructions, and other organic, unsound, objectionable, or deleterious matter. Principal Project Company shall remove such materials matter prior to the placement and reuse of fill.

2. Native soils must meet sieve and chloride requirements. Principal Project Company shall submit sample results to the SAR group within City Public Works Department prior to placement.
3. With approval by the SAR group within Public Works Department, native soils that are visually contaminated or are classified as a California Class I (non-RCRA) may be reused within the "area of contamination" and within 150 linear feet from its origin. Re-use of native soils must meet the engineering backfill and compaction requirements, is delineated with markers, documented, and meets the San Francisco Department of Public Health (SFDPH) requirements.
4. Principal Project Company shall notify the SAR group within City Public Works Department when and where the soils are used as backfill.
5. Surplus native soils shall be properly characterized and disposed of.

### **3.4 REUSE AND RECYCLING OF EXCAVATED SOILS AT OTHER FACILITIES**

- A. If Principal Project Company seeks to reuse or recycle surplus excavated soils at other projects or recycling facilities rather than dispose of them at a permitted landfill, Principal Project Company shall ensure the Contractor responsible for such reuse or recycle work, at its cost:
  1. Demonstrate that with the existing environmental test results that the soils can be reused or recycled. Principal Project Company at its expense may be allowed to conduct additional testing, and characterization of the soils, only with prior approval by the SAR group within City Public Works Department.
  2. Submit the acceptance criteria of the receiving facility or project.
  3. Submit a letter of acceptance from the receiving facility or project. The letter shall indicate the volumes of soils accepted. Submit a value engineering calculation demonstrating cost savings to the SAR group within City Public Works Department. Any savings that result from such reuse or recycle work will be a split 50/50 between the City and Principal Project Company.
- B. If the SAR group within City Public Works Department accepts the above, Principal Project Company shall in connection with such reuse or recycling:
  1. be responsible for, and indemnify the City from, any and all increased cost and future liability arising from the reclassification, recycling, or reuse or the surplus excavated soils if, upon reuse or recycling of such soils at any time thereafter, it is determined that the surplus excavated soils are in fact hazardous, and should not have been reused or recycled.
  2. Submit a copy of the letter of acceptance and all records, including the financial statements for the value engineering saving prior to the approval of the reuse or recycling of these soils.
  3. Bear all costs for any additional testing, characterization and profiling of the soils, including the value engineering cost.
  4. Bear all costs for the transportation, and any other associated cost for moving these soils to another project or to a recycling facility.
  5. Revise and retain its pollution liability insurance to cover this work.
  6. Repay any cost that the SAR group within City Public Works Department at its discretion will incur to conduct its own testing to confirm Principal Project Company's findings.

7. Submit a monthly reuse and recycling spreadsheet of all reused and recycled materials generated from the Project. The spreadsheet shall include information of the receiving facility or project, quantity transported (Cubic Yards), weight tags from the recycling facility.
8. The City will issue a Change Order for this work to effectuate any saving that may accrue from this Section.
9. Such work shall only be done as a Change Order after the acceptance and approval of the City and after the Change Order is processed.

**3.5 IMPORT SOIL (FILL)**

- A. Import soil (Fill) is soil or fill material received from sources outside of the Project right-of-way. Import soil (fill) includes import bedding sand and import recycled backfill sand used in the base and subbase layers of a pavement or roadway or sporting field.
- B. Environmental/chemical testing is required for each source and of the same soil classification type (based on the unified soil classification system) of the import soil (fill).
- C. In advance of hauling in and use of import soil (fill) Principal Project Company for each source of import soil (fill), shall provide the SAR group within City Public Works Department the original source of where the import soil (fill) is coming from, the name of the laboratory used to analyze the soils, and the date of chemical analysis. Laboratory results shall not be over 6 months old.
- D. Principal Project Company shall provide chemical analytical results for each source and of the same soil classification type (based on the unified soil classification system) of import soil (fill) in accordance with the Recommended Fill Material Sampling Schedule stated in the Department of Toxic Substances Control (DTSC) Advisory Note for Clean Imported Material (as shown below). If Principal Project Company brings import soils from different sources, then the "Sample per Volume" count re-starts for each of different source of import soil (fill) (as shown below).

Import Fill Volumes (for each source of import soil (fill) and of the same soil classification type)	Samples Per Volume for each source of import soil (fill) and of the same soil classification type
Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for the first 1,000 yards + 1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for the first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

- E. Each source of import soil (fill), import bedding sand and import recycled backfill sand of the same type, shall be analyzed as a four-point composite. Each composite shall be analyzed for Total Petroleum Hydrocarbons-Gasoline/BTEX/MTBE (EPA Method 8015 mod/8021), TPH-Diesel/Motor Oil (EPA Method 8015 with silica gel cleanup), Volatile Organic Carbons VOC's (EPA Method 8260), Semi-Volatile Organic Carbons SVOC's (EPA Method 8270), Organochlorine Pesticides (EPA Method 8081), Polychlorinated Biphenyls (EPA Method 8082), Title 22 Metals (EPA Methods 6000/7000 Series), Asbestos (CARB Method 435), Chromium +6 (EPA Method 7199), and soluble Total Concentration Leaching Potential (TCLP) and Soluble Threshold Limit Concentration (STLC) metals (as warranted – 10x STLC & 20x TCLP).

- F. Import soils (fill) has to meet both the engineering backfill criteria and the chemical criteria of these contract specifications.
- G. Chemical Criteria: To be accepted, the chemical concentrations of the import soil (fill) has to be equal or less than the values set forth in the Regional Water Quality Control Board (RWQCB)'s Environmental Screening Levels (ESLs), Tier 1 levels. Soils (fill) with the following chemical levels shall not be accepted as import soils (fill).
1. Exceedance of the chemical values set forth in the Regional Water Quality Control Board (RWQCB)'s Environmental Screening Levels (ESLs), Tier 1 levels.
  2. Lead that exceeds 80 mg/kg.
  3. Serpentine (naturally occurring asbestos) and odorous soils
  4. Petroleum Hydrocarbons or Oil and Grease of any type that exceed 100 mg/kg.
  5. Asphalt, concrete, bentonite, bay mud, clay, bricks, cobblestones, rocks, rubble, scrap metal, railroad tracks and ties, debris, soils containing asbestos, imported contaminated soils, vegetation, wood, debris, slag, obstructions, and other organic, unsound, unsatisfactory, or deleterious matter.
- H. Environmental/chemical testing is not required of the base and subbase layers for the following materials that are used to build a pavement or roadway or sporting field: Base rock, Class II Aggregate Base (AB), Class II Recycled Base, Crushed Aggregate Base (CAB), Crushed Miscellaneous base (CMB), Processed Miscellaneous Base (PMB), Recycled Aggregate, Aggregate Subbase (ASB), reclaimed/recycled asphalt concrete (AC), and drain/crushed rock.
- I. Reclaimed/recycled asphalt concrete (AC) is acceptable for the base and subbase layers to build a pavement or roadway or sporting field.
- J. Crushed concrete is acceptable for the base and subbase layers to build a pavement or roadway or sporting field.
- K. Import material for backfill shall comply with the Section 714 Standard Specifications and Plans, Department of Public Works, City and County of San Francisco. The Standard Specifications and Standard Plans are accessible online at <http://www.sfpublicworks.org/services/standards-specifications-and-plans>; and the specifications of the Water Department for work under the jurisdiction of the SFPUC's Water Department.
- L. The SAR group within City Public Works Department reserves the right to spot check and analyze the import soils (fill) as it deems necessary, including prior to it being brought on to the project site, even after the approval of the submittal of analytical results from Principal Project Company, as well as after it is brought onsite.
- M. Should the analyses of the import soils (fill) test out to exceed the above criteria, then Principal Project Company shall be given a chance to re-sample, for re-analyses. Should the re-analyses import soils (fill) test out to exceed the above criteria, then Principal Project Company shall have to remove the import soils (fill) at its own expense and replace with clean import soil (fill). In such a case, Principal Project Company shall bear all the cost (including the City's cost) for re-analysis.
- N. For recreation and park projects, and community/urban gardens, Principal Project Company shall install a visual barrier (such as a plastic orange snow fence) in all areas between the native fill, backfill from other areas of the site, and the import (soil) fill. Principal Project

Company shall request the SAR group within City Public Works Department inspection of the visual barrier, and obtain their approval prior to Principal Project Company filling soil over it.

- O. Principal Project Company shall request inspection of the subbase placement for proper grades and depths by the SAR group within City Public Works Department, and obtain their approval prior to Principal Project Company filling soil over it.
- P. Analytical costs for imported fill (soil) shall be born by Principal Project Company.
- Q. Principal Project Company shall furnish the above analytical results at least 10 working days prior to bringing the import soil (fill) into the Project Site. The acceptance of import soil (fill) will be made by the SAR group within City Public Works Department and will depend on the results of the analytical testing, backfill requirements of the Contract Documents regardless if it meets the testing requirements of Division 31 Earthwork and Section 31 23 33 Trenching and Backfilling.
- R. Import soil (fill) shall not be brought on-site, prior to approval of the analytical results by the SAR group within City Public Works Department. Analytical results submitted shall be referenced on the import fill spreadsheet submittal.
- S. Import soil (fill) shall be brought on-site at a rate where it is immediately used in the excavation. If the SAR group within City Public Works Department allows for import material to be stored overnight (only, and not longer) on site, then such import material shall be covered and placed at Principal Project Company's soils management yard, approved soil stockpile staging area or an area within the project alignment authorized by the SAR group within City Public Works Department. Stockpiles being stored overnight shall be completely covered with 10 mil HDPE plastic and braced (weighted or tied down) securely.
- T. Import Fill Spreadsheet: As warranted, Principal Project Company shall submit five hardcopies or a digital copy of a monthly spreadsheet of all imported fill deposited at the Project Site to the SAR group within City Public Works Department. The spreadsheet shall include information on the project name, contract No., origin of import (street address, city), location of deposit (street address and depth range), quantity (cubic yards), soil type based on the unified soil classification system, the corresponding chemical, correspondent environmental analytical results submitted, truckers and trucking firm(s) used and trucking logs and invoices.

### **3.6 SECURING AREAS WITH EXPOSED, EXISTING SOIL**

- A. Wherever Construction Work exposes the existing soil or where existing soil is stockpiled, these areas shall be barricaded all around with continuous (no gaps greater than 4 inches) fencing (either metal wire or orange plastic), Triton barriers or other barricades at least 3 feet high. Principal Project Company shall ensure that barricades are installed taunt and secured against strong winds. Alternatively, the exposed, existing soil in excavation areas such as trenches, may be covered over with plates or other acceptable means. The intent is to secure the exposed, existing soil from public contact.

**END OF SECTION**

---

# Division 11: Make-Ready Requirements for Retail Space at 17<sup>th</sup> Hampshire

## **Division 11: Make-Ready Requirements for Retail Space at 17<sup>th</sup> Hampshire**

Principal Project Company shall plan for, design, and construct a retail space as part of the Infrastructure Facility at the corner of 17<sup>th</sup> Street at Hampshire Street. The retail space shall be approximately 600 square feet and be delivered in a 'warm shell' condition at Substantial Completion, enabling the permitted occupancy of a to-be-determined retail use.

The retail space must be operationally ready, which means it must meet the following requirements:

1. Receive a temporary certificate of occupancy from the City as Regulator;
2. Walls and ceilings are finished, furred as necessary and with the installation of drywall complete;
