Drive Time Analysis

A drive time analysis was performed by collecting second-by-second vehicle location data on San Jose Avenue between the northbound I-280 Ocean Avenue on-ramp and the Randall Street intersection.

Bicycle Volumes

Evening peak bicycle traffic on northbound San Jose Avenue rose significantly with an increase of 68 percent, and average daily bike traffic increased 26 percent.

Background

The “Bernal Cut” segment of San Jose Avenue between the I-280 off-ramp and Randall Street hosts freeway-like conditions on a city street. This problem is partially fed by a two-lane off-ramp from northbound I-280, which was widened from a single lane to accommodate detoured traffic after the 1989 Loma Prieta earthquake, which necessitated the closure of the Central Freeway. Residents have long expressed concerns about high vehicular speeds, and a portion of the corridor is part of the Vision Zero High-Injury Network for vehicular collisions. In addition, the Glen Park Community Plan recommended further steps toward reconfiguring San Jose Avenue into an avenue, rather than an urban freeway.
I-280 Off-Ramp Improvements

Phase 1 Configuration

Continuous 2-lane off-ramp from the freeway mainline onto San Jose Avenue

Phase 2 Configuration

2-lane off-ramp with a merge to 1-lane on the ramp, with 1 lane continuing onto San Jose Avenue

Potential Alternate Configuration

1-lane off-ramp from the freeway mainline onto San Jose Avenue
San Jose Avenue Improvements

In coordination with the 2016 repaving project on San Jose Avenue, SFMTA will implement the following:

- Install a concrete barrier in the bicycle lane buffer to increase separation and comfort
- Improve signage along the corridor to enhance clarity for drivers and enable speeding enforcement
- Maintain the current lane configuration of two traffic lanes and a buffered bicycle lane

### Signage Improvements:

- Install a concrete barrier in the bicycle lane buffer to increase separation and comfort
- Improve signage along the corridor to enhance clarity for drivers and enable speeding enforcement
- Maintain the current lane configuration of two traffic lanes and a buffered bicycle lane

### Bikeway Improvement:

- Install a concrete barrier in the bicycle lane buffer to increase separation and comfort
- Improve signage along the corridor to enhance clarity for drivers and enable speeding enforcement
- Maintain the current lane configuration of two traffic lanes and a buffered bicycle lane

Neighborhood Traffic Calming

The San Francisco Municipal Transportation Agency (SFMTA) is currently working with your community to make travel in the area safer for all road users by slowing down speeding vehicles. These efforts have resulted in the implementation of speed humps or cushions at five locations. These speed humps are designed to reduce speeding and cut-through traffic from San Jose Avenue.

Next Steps:

- SFMTA will finish technical vetting of the proposed traffic calming devices
- Neighbors will receive more information in the mail once the proposal is vetted
- Residents will have an opportunity to place a final vote on speed hump or cushion approval
- After a public hearing, SFMTA will work with Department of Public Works to build the traffic calming devices

For more information about the Residential Traffic Calming Program, please visit www.sfmta.com/calming
The San Francisco Municipal Transportation Agency (SFMTA) is working with San Francisco Public Works to install pedestrian improvements proposed by the Mission District Streetscape Plan in coordination with the San Francisco Public Works Paving Project on San Jose Avenue, Guerrero Street, and Dolores Street.

Nearby Enhancements:

Traffic medians on Guerrero Street will be widened from 4-foot wide to 5-foot wide and extended to the crosswalk to provide larger pedestrian refuge zones at intersections.

Locations:
- Guerrero Street at Cesar Chavez Street
- Guerrero Street at Duncan Street
- Guerrero Street at 27th Street
- San Jose Avenue at 29th Street
